UNIVERSAL DICTIONARY

OF

SCIENCE, ART, LITERATURE, AND PRACTICAL MECHANICS,

COMPRISING A

POPULAR VIEW OF THE PRESENT STATE OF KNOWLEDGE.

ILLUSTRATED BY

NUMEROUS ENGRAVINGS, A GENERAL ATLAS,

AND APPROPRIATE DIAGRAMS.

Sic oportet ad librum, presertim miscellanei generis, legendum accedere lectorem, ut solet ad convivium conviva civilis. Convivator annititur omnibus satisfacere; et tamen si quid apponitur, quod hujus aut illius palato non respondeat, et hic et ille urbane dissimulant, et alia ferenla probant, ne quid contristent convivatorem. Erasmus.

A reader should sit down to a book, especially of the miscellaneous kind, as a well-behaved visitor docs to a banquet. The master of the feast events himself to satisfy his guests; but if, after all his care and pains, something should appear on the table that does not suitthis or that person's taste, they politely pass it over without notice, and commend other dishes, that they may not distress a kind host. Translation.

LONDON ENCYCLOPÆDIA.

HA'LO, n. s. A red circle round the sun or moon.

If the hail be a little flatted, the light transmitted may grow so strong, at a little less distance than that of twenty-six degrees, as to form a halo about the sun or moon; which halo, as often as the hail-stones are duly figured, may be coloured. Newton.

I saw by reflection, in a vessel of stagnated water, three halos, crowns or rings of colours about the sun, three halos, crowns or rings of concentrick to his body. like three little rainbows, concentrick to his body. Id.

HALO, or Corona, in optics, is a luminous circle surrounding the sun, moon, planets, or fixed stars. Sometimes these circles are white, and sometimes colored like the rainbow. Sometimes one only is visible, and sometimes several concentric halos appear at the same time. Those which have been seen about Sirius and Jupiter were never more than 3°, 4°, or 5° in diameter; those which surround the moon are, also, sometimes no more than 3° or 5°; but these, as well as those which surround the sun, are of very different magnitudes, viz. of 12° 0', 22° 35', 30° 0', 38° 0', 41° 2', 45° 0', 46° 24', 47° 0', and 90°, or even larger than this. Their diameters also sometimes vary during the time of observation, and the breadths both of the colored and white circles are very different, viz of 2°, 4°, or 7°. Their colors are more diluted than those of the rainbow; and they are in a different order, according to their size. Mr. Huygens observed red next the sun, and a pale blue outwards. Sometimes they are red on the inside and white on the outside. M. Weidler observed one that was yellow on the inside and white on the outside. In France one was observed, in 1683, the middle of which was white ; after which followed a border of red, next to it was blue, then green, and the outermost circle was a bright red. In 1728 one was seen of a pale red outwardly, then followed yellow, and then green, terminated by a white. In Holland, M. Muschenbroeck says, fifty may be seen in the day-time, almost every year; but they are difficult to be observed, except the eye be so situated, that not the body of the sun, but only the neighbouring parts of the heavens, can be seen. Mr. Middleton says, that this phenomenon is very frequent in North America; for that there is generally one or two about the sun every week, and as many about the moon every month. Halos round the sun are very frequent in Russia. M. Æpinus says, that from the 23d of April, 1758, to the 20th of September, he himself had observed no fewer than twenty-six, and that he has sometimes seen twice as many in the same space of time.

Similar, in some respects, to the halo, was the remarkable appearance which M. Bouguer describes, as observed on the top of Mount Pichinca, in the Cordilleras. When the sun was just rising behind them, so as to appear white, each of Vol. XI.—PART I. A ros a voit of DSW

them saw his own shadow projected upon it, and no other. The distance was such that all the parts of the shadow were easily distinguishable, as the arms, the leg, and the head; but what surprised them most was, that the head was adorned with a kind of glory, consisting of three or four small concentric crowns, of a very lively color, each exhibiting all the varieties of the pri-mary rainbow, and having the circle of red on the outside. The intervals between these circles continued equal, though the diameters of them all were constantly changing. The last of them was very faint; and at a considerable distance was another great white circle, which surrounded the whole. As near as M. Bouguer could com pute, the diameter of the first of these circles was about 53°, that of the second 11°, that of the third 17°, and so on; but the diameter of the white circle was about 76°. This phenomenon never appeared but in a cloud consisting of frozen particles, and never in drops of rain like the rainbow. When the sun was not in the horizon, only part of the white circle was visible, as M. Bouguer frequently observed afterwards. Similar to this curious appearance was one seen by Dr. M'Fait in Scotland; who observed a rainbow round his shadow in the mist, when he was upon an eminence above it. In this situation the whole country round seemed buried under a vast deluge, and nothing but the tops of distant hills appeared here and there above the flood. In those upper regions, the air, he says, is at that time very pure and agreeable. At another time he observed a double range of colors round his shadow. The colors of the outermost range were broad and very distinct, and every where about two feet distant from the shadow. Then there was a darkish interval, and after that another narrower range of colors, closely surrounding the shadow, which was very much contracted. He thinks that these ranges of colors are caused by the inflection of the rays of light, the same that occasioned the ring of light which surrounds the shadow of all bodies, observed by M. Maraldi, and this author.

Halos may be produced by placing a lighted candle in the midst of steam in cold weather. If glass windows be breathed upon, and the flame of a candle be placed some feet from it, while the spectator is also at the distance of some feet from another part of a window, the flame will be surrounded with a colored halo. And if a candle be placed behind a glass receiver, when air is admitted into the vacuum within it, at a certain degree of density, the vapor with which it is loaded will make a colored halo round the flame. This was observed by Otto Gucricke. In December 1756 M. Muschenbroeck observed, that, when the glass windows of his room were covered with a thin plate of ice on the inside, the moon appearing through it was surrounded with

a large and variously colored halo; and, opening the window, he found that it arose entirely from that thin plate of ice, for none was seen except through it. Dr. Kotelnihow, having, like Dr. Halley, made very accurate observations to determine the number of possible rainbows, considers the colored halo, which appears about a candle, as the same thing with one of those bows which is formed near the body of the sun, but which is not visible on account of his excesssive splendor.

Descartes observes, that the halo never appears when it rains; from which he concludes that this phenomenon is occasioned by the refraction of light in the round particles of ice, which are then floating in the atmosphere; and, though these particles are flat when they fall to the ground, he thought they must be protuberant in the middle before their descent; and according to this protuberancy he imagined that the diameter of the halo would vary.-In treating of meteors, Gassendi supposed, that a halo is of the same nature with the rainbow, the rays of light being in both cases twice refracted and once reflected within each drop of rain or vapor, and that all the difference there is between them arises from their different situation with respect to the observer. For whereas, when the sun is behind the spectator, and consequently the rainbow before him, his eye is in the centre of the circle; when he views the halo, with his face towards the sun, his eye is in the circumference of the circle; so that, according to the known principles of geometry, the angle under which the object appears, in this case, must be just half of what it is in the other.

M. Dechales endeavours to show that the generation of the halo is similar to that of the rainbow. If, says he, a sphere of glass or crystal, full of water, be placed in the beams of the sun, there will not only be two circles of colored light on the side next the sun, and which constitute the two rainbows; but there will also be another on the part opposite to the sun, the rays belonging to which afterwards diverge, and form a colored circle, such as will be visible, if the light that is transmitted through the globe be received on a piece of white paper. The reason why the colors of the halo are more dilute than those of the rainbow, he says, is owing principally to their being formed not in large drops of rain, but in very small vapor; for, if the drops of water were large, the cloud would be so thick, that the rays of the sun could not be regularly transmitted through them; and, on the other hand, he observed, that when the rainbow is formed by very thin vapors, the colors hardly appear. As for those circles of colors which are sometimes seen round candles, it was his opinion that they are owing to nothing but moisture on the eye of the observer; for that he could never produce this appearance by means of vapor only, if he wiped his eyes carefully; and he had observed that such circles are visible to some persons and not to others, and to the same persons at one time and not another.

The most considerable and generally received theory, respecting halos, is that of Huygens, published in the English Philosophical Transactions.

See Lowthorp's Abridgment, Vol. II., p. 189. Sir Isaac Newton mentions it with respect. This article contains the heads of a discourse which he afterwards composed, but never quite finished; and which has been translated, with some additions, by Dr. Smith, from whom the following account is chiefly extracted. Mr. Huygens was first led to think particularly upon this subject, by the appearance of five suns at Warsaw, in 1658; after which, he says, he hit upon the true cause of halos and mock suns. If we can conceive any kind of bodies in the atmosphere, which, according to the known laws of optics, will, either by reflection or refraction, produce the appearance in question, when nothing else can be found that will do it, we must acquiesce in the hypothesis, and suppose such bodies to exist, even though we cannot give a satisfactory account of their generation. Two such bodies are assumed by M. Huygens; one of them a round ball, opaque in the centre, but covered with a transparent shell; and the other is a cylinder, of a similar composition. By the help of the former he endeavours to account for halos, and by the latter for those appearances which are called mock suns. Those bodies which M. Huygens requires, in order to explain these phenomena, are not, however, a mere assumption; for some such, though of a larger size than his purpose requires, have been actually found, consisting of snow within and ice without. They are particu-larly mentioned by Descartes. The balls with the opaque kernel, which he supposed to have been the cause of them, he imagines not to exceed the size of a turnip-seed.

M. Marriotte accounts for the formation of the small coronas by the transmission of light through aqueous vapors, where it suffers two refractions without any intermediate reflection. He shows that light which comes to the eye, after being refracted in this manner, will be chiefly that which falls upon the drop nearly perpendicular; because more rays falling upon any given quantity of surface in that situation, fewer of them are reflected with small degrees of obliquity, and they are not so much scattered after refraction. The red will always be outermost in these halos, as consisting of rays which suffer the least refraction. And whereas he had seen, when the clouds were driven briskly by the wind, halos round the moon, varying frequently in their diameter, being sometimes of 2°, sometimes of 3°, and sometimes of 4°; sometimes also colored, sometimes only white, and sometimes disappearing entirely; he concluded that all these variations arose from the different thickness of the clouds, through which sometimes more and sometimes less light was transmitted. He supposed, also, that the light which formed them might sometimes be reflected, and at other times refracted. As to those coronas which consist of two orders of colors, he imagined that they were produced by small pieces of snow, which, when they begin to dissolve, form figures which are a little convex towards their extremities. Sometimes, also, the snow will be melted in different shapes; and, in this case, the colors of several halos will be intermixed and confused; and such, he says, he had sometimes observed round the sun. M. Marriotte then

proceeds to explain the larger halos, viz. those that are about 45° in diameter, and for this purpose he has recourse to equiangular prisms of ice, in a certain position with respect to the sun; and he takes pains to trace the progress of the rays of light for this purpose; but this hypothesis is very improbable. In some cases he thought that these large coronas were caused by hailstones, of a pyramidal figure; because, after two or three of them had been seen about the sun, there fell the same day several such pyramidal hail-stones. M. Marriotte explains parhelia by the help of the same suppositions. See PARNE-LION.

M. Muschenbroeck concludes his account of coronas with observing, that some density of vapor, or some thickness of the plates of ice, divides the light in its transmission through the small globules of water, or their interstices, into its separate colors: but what that density was, or what was the size of the particles which composed the vapor, he could not determine.

Sir Isaac Newton considered the larger and less variable appearances of this kind as produced according to the common laws of refraction, but that the less and more variable appearances depend upon the same cause with the colors of thin plates. He concludes his explication of the rainbow with the following observation on halos and parhelia :-- ' The light which comes through drops of rain by two refractions, without any reflexion, ought to appear the strongest at the distance of about 26° from the sun, and to decay gradually both ways as the distance from him increases. And the same is to be understood of light transmitted through spherical hailstones: and if the hail be a little flatted, as it often is, the transmitted light may be so strong, at a little less distance than that of 26°, as to form a halo about the sun or moon; which halo, as often as the hail-stones are duly figured, may be colored, and then it must be red within by the least refrangible rays, and blue without by the most refrangible ones; especially if the hail-stones have opaque globules of snow in their centres to intercept the light within the halo, as Mr. Huygens has observed, and made the inside of it more distinctly defined than it would otherwise be. For such hail-stones, though spherical, by terminating the light by the snow, may make a halo red within, and colorless without, and darker within the red than without, as halos use to be. For, of those rays which pass close by the snow, the red-making ones will be the least refracted, and so come to the eye in the straightest lines.' Some farther thoughts of Sir Isaac Newton's on halos are subjoined to the account of his experiments on the colors of thick plates of glass which he conceived to be similar to those which are exhibited by thin ones :- ' As light reflected by a lens quicksilvered on the back side makes the rings of the colors above described, so it ought to make the like rings in passing through a drop of water. At the first reflexion of the rays within the drop, some colors ought to be transmitted, as in the case of a lens, and others to be reflected back to the eye. For instance, if the diameter of a small drop or globule of water be about the

th part of an inch, so that a red-making ray, in passing through the middle of this globule, has 250 fits of easy transmission within the globule, and all the red-making rays, which are at a certain distance from this middle ray round about it, have 249 fits within the globules, and all the like rays at a certain farther distance round about it have 248 fits, and all those at a certain farther distance 247 fits, and so on, these concentric circles of rays, after their transmission, falling on a white paper, will make concentric rings of red upon the paper; supposing the light which passes through one single globule strong enough to be sensible, and in like manner the rays of other colors will make rings of other colors. Suppose now that in a fair day the sun should shine through a thin cloud of such globules of water or hail, and that the globules are all of the same size, the sun seen through this cloud ought to appear surrounded with the like concentric rings of colors, and the diameter of the first ring of red should be 7° 15', that of the second 10° 15', that of the third 12° 33', and, according as the globules of water are bigger or less, the ring should be less or bigger.' This curious theory our author informs us was confirmed by an observation which he made in 1692. He saw by reflexion, in a vessel of stagnating water, three halos, crowns, or rings of colors about the sun, like three little rainbows concentric to his body. The colors of the first or innermost, were blue next the sun, red without, and white in the middle, between the blue and red; those of the second crown were purple and blue within, pale red without, and green in the middle; and those of the third were pale blue within, and pale red without. These crowns enclosed one another immediately, so that their colors proceeded in this continual order from the sun outward ; blue, white, red ; purple, blue, green, pale yellow, and red; pale blue, pale red. The diameter of the second crown, mea sured from the middle of the yellow and red on one side of the sun to the middle of the same color on the other side, was 9° 33', or there-abouts. The diameters of the first and third he had not time to measure; but that of the first seemed to be about 5° or 6°, and that of the third about 12°. The like crowns appear sometimes about the moon: for in the beginning of the year 1664, on February 19th, at night, he saw two such crowns about her. The diameter of the first, or innermost, was about 3°, and that of the second about 5° 30'. Next about the moon was a circle of white; and next about that the inner crown, which was of a bluish green within, next the white, and of a yellow and red without; and next about these colors were blue and green on the inside of the outer crown, and red on the outside of it. At the same time there appeared a halo at the distance of about 22° 35' from the centre of the moon. It was elliptical; and its long diameter was perpendicular to the horizon, verging below farthest from the moon. He was told that the moon has sometimes three or more concentric crowns or colors encompassing one another next about her body. The more equal the globules of water or ice are to one another, the more crowns of colors will appear, and the

4

colors will be the more lively. The halo, at the distance of 22° 30' from the moon, is of another sort. By its being oval, and more remote from the moon below than above, he concludes that it was made by refraction in some kind of hail or snow floating in the air in an horizontal posture, the refracting angle being about 50° or 60°. Dr. Smith, however, makes it sufficiently evident, that the reason why this halo appeared oval, and more remote from the moon towards the horizon, is a deception of sight, and the same with that which makes the moon appear larger in the horizon.

HALORAGUS, in botany, a genus of the tetragynia order and octandria class of plants: CAL. quadrifid above; there are four petals; a dry plum, and a quadrilocular nut.

HALS'ENING, adj. Germ. mass, Sound-hass, the neck. Sound-) ing harshly; inharmo-HAL'SER, n.s. nious in the throat or tongue. Not in use. Halser, from Sax. balr neck, and yeel a rope. It is now in marine pronunciation corrupted to

hawser. A rope less than a cable. The crueltee of thee, Quene Medea !

Thy litel children hanging by the hals,

For thy Jason that wos of love so fals.

Chaucer. Prologue to the Man of Lawe's Tale. A beechen mast then in the hollow base

They hoisted, and with well-wreathed halsers hoise Their white sails. Chayman.

This halsening horny name hath, as Cornuto in Italy, opened a gap to the scoffs of many. Carew.

No halsers need to bind these vessels here, Nor hearded anchors ; for no storms they fear.

Dryden.

HALSTEAD, a market town of Essex, seated on a rising ground, on the Coln, forty-seven miles north-east of London. It has an old church, the steeple of which was once burnt down by lightning, but rebuilt at the expense of Robert Fiske, esq. The town consists of about 800 houses. The inhabitants manufacture says, bays, calimancoes, &c. There is a free school for forty boys, and a very antique Bridewell. Its market on Friday is noted for corn.

HALT, v. n., adj. & n. s.) Sax. bealt, lame;

HALTER, n. S. Spealzan, to limp. To limp, or falter in walking; one who is disabled; a cripple; to stop suddenly as soldiers in a march; to doubt or hesitate; to be undecided; to fail or falter; in a religious sense, to backslide from former steadfastness.

How long halt ye between two opinions ?

1 Kings.

All my familiars watched for my halting, saying, Peradventure he will be enticed, and we shall prevail against him. Jeremiah.

Bring in hither the poor, the maimed, the halt, and the blind. Luke.

For false Fortune hath played a game

At chesse with me, alas the while !

The trayteresse, false and full of gyle-

That al behoteth and nothing halte,

She goth upright and yet she halte.

Chaucer. The Boke of the Duchesse. Here's a paper written in his hand ;

A halting sonnet of his own pure brain,

Fashioned to Beatrice. Shakspeare. And will she yet debase her eyes

On me, that halt and am mis-shapen thus? Id.

Without any halt they marched between the two Clarendon. armies.

He might have made a halt 'till his foot and artillery Id. came up to him.

The heavenly bands

Down from a sky of jasper lighted now Milton. In Paradise, and on a hill made halt.

Scouts each coast light armed scour

Each quarter to descry the distant foe,

Where lodged, or whither fled, or if for fight

Milton. In Motion, or in halt. Thus inborn broils the factions would engage,

Or wars of exiled heirs, or foreign rage,

'Till halting vengeance overtook our age. Druden. I was forced to halt in this perpendicular march. Addison.

Spenser himself affects the obsolete, And Sidney's verse halts ill on Roman feet.

Pope

The man who pauses on the paths of treason Halts on a quicksand, the first step ingulphs him.

HALTER, n. s. & v. a. Sax. pealrzne, from palr, the neck. A rope to hang malefactors; to bind with a cord; to catch in a noose.

Whom neither halter binds nor burthens charge. Sandys.

He's fled, my lord, and all his powers do yield ; And humbly thus, with halters on their necks, Expect your highness' doom of life or death.

Shakspeare.

They were to die by the sword if they stood upon defence, and by the halter if they yielded; wherefore they made choice to die rather as soldiers than Hayward. as dogs.

Were I a drowsy judge, whose dismal note Disgorgeth halter, as a juggler's throat Doth ribbands.

Cleaveland.

He gets renown, who, to the halter near, But narrowly escapes and buys it dear. Dryden.

He might have employed his time in the frivolous delights of catching moles and haltering frogs.

Atterbury.

HALTER-CAST is an excoriation of the pastern, occasioned by the halter's being entangled about a horse's foot, upon his endeavouring to rub his neck with his hinder feet. For the cure, anoint the place, morning and evening, with equal quantities of linseed oil and brandy, well mixed.

HALTERISTÆ, in antiquity, a kind of players at discus. Some take the discus to have been a leaden weight or ball, which the vaulters bore in their hands, to secure and keep them-sclves the more steady in their leaping. Others say the halter was a lump of lead or stone, with a hole or handle fixed to it, by which it might be carried. Hier. Mercurialis, in his treatise De Arte Gymnastica, l. ii. c. 12, distinguishes two kinds of halteristæ; for, though there was but one halter, there were two ways of applying it. The one was to throw or pitch it; the other only to hold it out at arm's end, and in this posture to give themselves divers motions, swinging the hand backwards and forwards, according to the engraven figures thereof given us by Mercurialis. The halter was of a cylindrical figure, smaller in the middle, where it was held by one diameter, than at the two ends. It was above a foot long, and there was one for each hand : it was either of iron, stone, or lead. Galen, De Tuend. Vale-

Hill's Henry V.

tud. lib. i. v. and vi., speaks of this exercise, and shows of what use it is in purging the body of peccant humors, making it equivalent both to purgation and phlebotomy.

HALVE, v. a. Dan. halv. See HALF. HALVES, interj. To divide equally : halves is an expression by which any one lays claim to an equal share. See HALF.

Have you not seen how the divided dam Runs to the summons of her hungry lamb? But, when the twin cries halves, she quits the first.

Cleaveland.

HALYMOTE properly signifies a holy or ecclesiastical court. There is a halymote held in London, before the lord mayor and sheriffs, for regulating the bakers. It was anciently held on Sunday before St. Thomas's day, and hence called the haly mote, or holy court.

HALYS, in ancient geography, the noblest river of the Hither Asia, through which it has a long course, was the boundary of Crœsus's kingdom on the east. Running down from the foot of Mount Taurus, through Cataonia and Cappadocia, it divided almost the whole of the Lower Asia, from the sea of Cyprus down to the Euxine, according to Herodotus; who seems to extend its course too far. According to Strabo, who was a Cappadocian, it had its springs in Great Cappadocia. It separated Paphlagonia from Cappadocia, and received its name, $\alpha \pi o \tau o v \alpha \lambda o \varsigma$, from salt, because its waters were of a salt taste, from the soil over which they flowed. It is famous for the defeat of Cræsus, king of Lydia, who was misled by this ambiguous response of the oracle: Χροισος Αλυν διαβας μεγαλην αρχην διαλυσει; i.e. If Cræsus passes over the Halys he shall destroy a great empire. That empire proved to be his own. See CRESUS.

HAM, n. s. Saxon, ham; Dutch, hamme; Lat. hamus. The hip, or hinder HAM'BLE, v. n. HAM'ATED, adj. HAM'STRUNG, n. s. or part of the thigh; the HAM'STRING, v. a. thigh of a hog salted : any thing hooked; set with hooks. Hamble, formerly hamebe, and hamstring to cut the sinews of the back part of the thigh; the tendon of the ham.

And, thereto hath she laid her faith to borrow; Algote o footc is hameled, of thy sorowe.

Chaucer. Troilus and Creseide.

A player, whose conceit

Lies in his hamstring, doth think it rich

To hear the wooden dialogue, and sound "Twixt his stretched footing and the scaffoldage.

Shakspeare.

Hamstringed behind, unhappy Gyges died; Then Phalaris is added to his side. Dryden.

- Who has not learned, fresh sturgeon and ham eye Are no rewards for want and infamy? Pope. On the hinder side it is guarded with the two
- hamstrings. Wiseman. The ham was much relaxed; but there was some

contraction remaining. Id. Along this hall, and up and down, some squatted

Upon their hams were occupied at chess;

Others in monosyllable talk chatted,

And some seemed much in love with their own dress. Byron. Don Juan.

HAM, in commerce, &c. Westphalia hams are prepared by salting them with salt-petre,

pressing them in a press eight or ten days, then steeping them in juniper water, and drying them by the smoke of juniper wood. A ham may be salted in imitation of those of Westphalia, by sprinkling a ham of young pork with salt for one day, to fetch out the blood; then wiping it dry, and rubbing it with a mixture of 1 lb. of brown sugar, 1 lb. of saltpetre, 1 pint of bay salt, and 3 pints of common salt, well stirred in an iron pan over the fire, till moderately hot; let it lie three weeks in this salting, turn it often, then dry it, and hang it up. 'Smoked hams,' says Dr. Willich, are a very strong food, which is not easily digested. If eaten in proper time, and in small quantities, they may be a cordial to some vigorous stomachs, especially in the morning, as a substitute for the pernicious hot and buttered rolls; but boiling renders their digestion still more difficult. See SNOKING.

HAM, Heb. Dn, i.e. crafty. The youngest son of Noah, and father of Cush, Mizraim, Phut, and Canaan; each of whom possessed the countries peopled by them. Ham, it is believed, had all Africa for his inheritance, and peopled it with his posterity. He himself, it is thought, dwelt in Egypt; but M. Basnage is of opinion, that neither Ham nor Mizraim ever were in Egypt, but that their posterity settled in this country, and called it by the name of their ancestor. He also doubts of his having been worshipped as a god, by the name of Jupiter Hammon. Be that as it may, Africa is called the Land of Ham in Psalm Ixxviii. 51, cv. 23, cvi. 22. In Plutarch Egypt is called Chemia; and there are traces of the name of Ham or Cham in Psochemmis, and Psitta-chemmis, which are cantons of Egypt. See Egypt.

HAMADAN, or AMADAN, a city of Irak, Persia, standing on or near the site of the ancient Echatana. It was taken and destroyed by Timur, and ever since has been only a secondary place. It contains, however, still 10,000 meanly built houses, and about 40,000 inhabitants. The wall which surrounded it was not long since destroyed. Hamadan is famous for its manufacture of leather, and is a considerable mart of commerce between Ispahan and Bagdad, and between the latter place and Tehraun.

HAMADRYADES, from $a\mu a$, together, and dove, an oak, a kind of inferior deities revered among the ancient heathens, and believed to preside over woods and forests, and to be enclosed under the bark of oaks. They were supposed to live and die with the trees they were attached to, as is observed by Servius on Virgil, Eclog. x. v. 62, after Mnesimachus, the scholiast of Apollonius, &c., who mentions other traditions relating to them. The poets often confound the Hamadryads with the Naiads, Napææ, and rural nymphs in general. Festus calls them Querquetulanæ, as being sprung from oaks. Pherenicius, in Athenaus, lib. iii. calls the vine, fig-tree, and other fruit trees, hamadryades. This idea among the ancients, of intellectual beings annexed to trees, accounts for their worship of trees. Livy speaks of an ambassador addressing himself to an old oak, as to an intelligent person and a divinity .-- Lib. iii. § 25.

HAMAII, a town of Asiatic Turkey, in Syria,

situated on the river Orontes, By some travellers it is corruptly called Amarl and Amant. Some mistake it for the ancient Apamez, now called Afamiyah, but that town is a day's journey from Hamah; and Dr. Poeocke supposes Hamah to be the ancient Epiphania; whilst Theodoret, and other good geographers, maintain it to be Emesset in Syria. Hamah is seated among hills, and has a castle on one of them. It has always been a considerable place, and in the thirteenth and fourteenth centuries had princes of its own. Among these Ismael Abulfeda, prince of Hamah, from the year 1342, to 1345, was famous for his skill in geography. It is very large, and, being seated on the ascent of a hill, makes a fine appearance; but, like other towns under the Turkish government, is going to decay. Many of the houses are half ruined; but those which are still standing, as well as the mosques and castle, have their walls built of black and white stones, disposed so as to form various figures. The river Assi, the ancient Orontes, runs by the castle, and fills the ditches round it, which are cut very deep into the rock; it passes through the town from south to north, and, in its course, turns eighteen great wheels, called saki, which raise great quantities of water to a considerable height, and throw it into canals supported by arches, which run into the There are some pretty good marketgardens. places in Hamah. Linen is manufactured there, and sent to Tripoli to be exported into Europe. The sheiks of the town enjoy a high consideration. They inhabit a splendid palace, and have the title of emir. It is at present the only market for the Arabs, who roam over the extensive desert which intervenes between it and Tadmor, and who are under a sort of tacit agreement not to plunder the caravans coming to the city. Sixty-two miles S. S. W. of Aleppo. Long. 36° 15' E., lat. 35° 15' N.

IIAMAMELIS, witch hazel, a genus of the digyn.a order, and tetrandria class of plants. The involuerum is triphyllous, the proper calyx tetraphyllous; there are four petals; the nut horned and bilocular. There is but one species, a native of Virginia. It has a shrubby or woody stem, branching three or four feet high; oval, indented, alternate leaves, resembling those of common hazel; and flowers growing in clusters from the joints of the young branches, but not succeeded by seeds in this country. It is hardy, and is admitted as a variety in our gardens. Its flowers are remarkable for uppearing in November and December, when the leaves are fallen. It may be propagated either by seeds or layers.

It may be propagated either by seeds or layers. HAMAMET, a considerable sea-port on the east coast of Tunis, in a bay or gulf of the Mediterranean of this name. Dr. Shaw derives its name from Haman, wild pigeons, with which the country abounds. It contains some antiquities from the neighbouring ruins of the Civitas Siagitana, and is thirty miles south of Tunis.

HAMATII, in ancient geography, a kingdom of Syria. Toi, one of its monarchs, cultivated the friendship of David. 2 Sam. viii. 9.

HAMATH, the capital of the above kingdom, was seated on the Orontes. 'The entering into Hamath,' spoken of Josh. xiii. 5., Judges iii. 3, 2 Kings xiv. 25, and 2 Chron. vii. 8, is the narrow pass leading from the land of Canaan through the valley between Libanus and Antilibanus. This entrance is set down as the north boundary of Canaan, in opposition to its southern limits, the Nile. Joshua (xix. 35) assigned Hamath to the tribe of Naphtali. It was taken by the kings of Judah, and retaken from the Syrians by Jeroboam II. 2 Kings xiv. 28. The kings of Assyria at last took it, and transplanted the inhabitants into Samaria. 2 Kings xvii. 24, and xviii. 34, &c. It is the same with HAMAU. See that article.

HAMANOBIANS, HAMANOBII, OF HAMANO-BITE. From aµaža, a chariot, and $\beta \iotaog$, life. A people who had no houses, but lived in carriages. They were an ancient people of Sarmatia Europæa, inhabiting the southern part of Muscovy, and instead of houses had a sort of tents made of leather, fixed on carriages to be ready for travelling. Some say they inhabited the countries now called Bessarabia, Moldavia, Wallachia, and part of Transylvania.

HAMBURGII, one of the most important commercial cities in Europe, is situated at the confluence of the little rivers, Alster and Bille, with the Elbe, and about eighteen leagues from the sea. It is built in the Gothic style; the streets narrow and crooked; and it has many canals, crossed by eighty-one bridges. It is surrounded by a wall, on the top of which two carriages can drive abreast, and has six gates. The French, while in possession of it, constructed many other works: its population is about 120,000, and the territory about 15,000 more.

In the new town many of the houses are neatly built, and some streets elegant, particularly on the Alster, where the Jungfernsteig, planted with trees, is a fashionable promenade. Hamburgh has several suburbs: on its east side, between the Elbe and Alster, stands that of St. George, surrounded by a regular wall, and forming a separate parish. On the west is the Hamburger Berg, separated from Altona only by a wall. Here, adjacent to the Elbe, are the large oil works belonging to the Greenland fisheries, and at some distance two hospitals and a workhouse. On the north side of Hamburgh, along the Alster, is a new suburb, containing a number of elegant buildings.

Outside of the town the Alster forms a large basin; and within the town another of less extent, called the Binnen Alster, which serves as a harbour. An arm of the Elbe also forms two ports, one on the east for boats, and another on the west, called the Niederbaum, for ships. The depth of this harbour is twenty feet; but on account of a sand-bank opposite to the village of Blankenese, nine miles below Hamburgh, vessels that draw more than fourteen feet of water must discharge part of their cargo, except at spring tides, when the depth on the bank is eighteen feet. The hour of high water at new and full moon is six o'clock. Besides the Alster, a small river, called the Bill, flows by the east side of the city.

There are in Hamburgh five large and eleven small churches; that of St. Michael, a modern edifice, and that of St. Peter, are remarkable for their elegant spires; St. Nicholas for its fine chimes. The exchange hall is a new building, fitted up with great elegance, and containing a hall for the display of works of art, and a reading-room on a large scale. The other public buildings are not constructed in very good taste. The principal are the old exchange, the hospitals, and an obelisk in honor of professor Busch.

In former times brewing was a chief employment here; but it has long given place to other occupations. In the beginning of this century the refining of sugar employed more than 300 houses, and is still a considerable pursuit. The printing of cotton, linen, and handkerchiefs, is next in importance; then, perhaps, the dyeworks, and machinery for twisting tobacco. Other manufactures, on a comparatively small scale, are those of jewellery, whalebone, soap, wax, whale-oil, silk stuffs, gold and silver lace, needles, cards, sailcloth, and particularly stockings. For many years Hamburgh has been gradually exchanging its manufacturing for a mercantile character. Its transactions partly consist in agency, but more in the purchase and sale for account of its merchants. They buy the commodities of Great Britain, France, Spain, Portugal, the Netherlands, the West Indies, the United States of America; and supply all the countries lying along the Elbe, different districts on the Rhine and the Lower Maine, and a part of the Prussian and Austrian dominions. They also buy up the products of these countries, linen, thread, &c. The trade in timber is also of great importance, especially during a maritime war. The other articles of trade comprise flax, hemp, potash, tar, tobacco, dye-stuffs, wax, honey, hides, wool, woollen yarn, smoked and salt meat, mineral products, iron wares; in short, all the products of the north-east of Germany.

The following list of vessels which arrived at Hamburgh, in 1817, will show the prominence of our trade with this city :--

Total . 1640

Its commerce has since considerably increasd. The coasting trade with Bremen, Embden, and Amsterdam, is carried on by flat-bottomed vessels; a class of shipping of great convenience in time of war, as, from their keeping in the shallow water between the line of sandy islands and the continent, armed vessels can with difficulty approach them. They belong chiefly to the inhabitants of East Friesland, Ditmarsch, and Heligoland. The transit trade, or conveyance of goods by the Elbe, for account of foreign merchants, has hitherto been inconsiderable, but has been increased since 1816 by the heavy duties imposed by the Dutch government on merchandise forwarded into Germany by the Rhine; and by the regulations which have freed the Upper Elbe from a number of vexatious tolls.

The bank here was founded in 1619, to afford a permanent and uniform currency; it has never issued notes, and very seldom makes a cash payment; a merchant, depositing cash or bullion, receives credit for the amount in the books; this he makes use of, not by withdrawing the money, but by transferring it by draft or cheque to others, who again make similar transfers. Bank money having a permanent value, while coin was liable to degradation, the former soon rose in relative price, and often bears an agio, or premium of 25 per cent. The denominations of money in Hamburgh are not simple. Accounts are kept in marks, schillings, and pfennings lubs, thus :---

> 12 pfennings \equiv 1 schilling. 16 schillings \equiv 1 mark. 3 marks \equiv 1 dollar.

A mark is somewhat more than eighteen pence sterling; but the exchange with London is computed in Flemish money, of which £13 6s. 8d. are equal to 100 marks; the computation is thirty-two shs. Flemish, and upwards, for a pound sterling. With Amsterdam and Paris the computation of exchange is by marks, schillings, and pfennings; and the bill transactions are reckoned more important than those of any other place in Germany.

The established religion is the Lutheran, but complete toleration is granted: Catholics and Calvinists go to the chapels of the envoys from Catholic or Calvinist countries. The manners of the citizens much resemble those of Holland. The favorite taste, in respect to amusement, is music; and, before 1807, the higher class of merchants lived not only with hospitality, but luxury. This city has been at different times the residence of literary characters of the first eminence; and its charitable institutions are numerous. The revenue of the orphan-house is estimated at £6000 sterling; there is an hospital for receiving poor travellers that fall sick; and, in the well known lombard, or place of deposit for pawned articles, the town lends money at an interest of 6 per cent. on every kind of goods or merchandise. If the goods are not reclaimed, within a certain time, they are sold for their full value, and the excess over the money lent is returned to the owners. At the town library, containing, it is said, 100,000 volumes, is published the Hamburger Correspondenten, a newspaper of great circulation.

The constitution of the government is an aristocracy, checked by the citizens at large. The aristocratic part comprises the senate, to the number of twenty-eight voting members, who receive an annual salary, and constitute the executive; they have no hereditary right or distinction, but they have the privilege of electing

their own members. Such elections, however, are almost always in concurrence with the popular wish. The burgesses, or citizens, act by delegation in various ways; by a commission of fifteen, called the council of elders; by the council of sixty; and by an assembly of 180. These bodies are each entitled to confer with the senate on questions of importance. The senate alone can propose a law; its adoption or rejection rests with the representatives of the citizens. To be a citizen, in a legislative sense, it is requisite to be of the Lutheran faith, and to possess permanent property within the walls to the value of 1000 rixdollars (£240), or 2000 without the walls; but, within the territory, the right of citizenship, for mercantile purposes, is of easy acquisition, particularly to our countrymen. The whole of this constitution was framed by a commission appointed by the emperor of Germany in 1712, previous to which the government of Hamburgh had been a source of frequent strife between the senate and citizens.

The city revenue exceeds £150,000, arising chiefly from customs and assessed taxes. These defray the public salaries, and the pay of the military, who are in number 2000. An annual expense of £15,000 is incurred on account of the river, in buoys, light-houses, and in keeping it clear of mud; and is raised by a toll on the shipping. The territory of Hamburgh hardly exceeds 133 square miles. It consists of a small district lying around the city, of the town and bailiwic of Cuxhaven, at the mouth of the Elbe, and some villages in the duchy of Holstein. Hamburgh is connected with Frankfort, Lubeck, and Bremen, in some commercial regulations; and they all retain the old name of Hanse Towns.

In 833 Louis the Pious crected Hamburgh into a bishopric, and afterwards into an archbishopric. Adolphus III. duke of Saxony, among other privileges, granted it the right of fishing in the Elbe, eight miles above and below the city. It was declared a free imperial city in The kings of Denmark, when they suc-1618. ceeded to the counts of Holstein, claimed the sovereignty of this place, and often compelled the citizens to pay large sums to purchase the confirmation of their liberties. The year 1768 was remarkable for a renunciation of this claim, and for a full confirmation of Hamburgh in her rights as an independent city. Her trade and population now continued to increase: the French revolution for some time augmented them; and when, after 1796, Germany felt the shock of invasion, Hamburgh was secure under the protection of Prussia. It thus preserved its independence amid all the partitions of territory until, at the end of 1806, a large French garrison was stationed here, and Buonaparte seized a part of the public funds." In 1810 it was incorporated into the French empire, as the capital of the department of the Mouths of the Elbe. The decrees of Buonaparte, prohibitory of commerce, continued with immense loss to this city from 1808 until the spring of 1813, when the hope of support from the troops of the allies led to a memorable, but premature effort (18th of March) against the French. Hamburgh was re-occupied by the latter on the 30th of May, when a contribution of nearly £2,000,000 sterling was imposed on it, and orders given to defeud it at whatever sacrifice against the allies. This led to great distress, to the destruction of the houses on the ramparts, the seizure of a great deal of merchandise, and finally of the bank funds. At last it was evacuated, May 1814, and part of the bank funds have been restored by the Bourbons. The congress of Vienna accorded to Hamburgh a vote in the Germanic diet, in conjunction with Frankfort, Lubeck, and Bremen. It is thirtynie miles S. S.W. of Lubeck, eighty-four north of Hanover, and 448 north-east of London.

HAME, n. s. Sax. pama. The collar by which a horse draws in a waggon.

HAMEL. See HAMLET.

HAMEL (John Baptiste Du), a learned French philosopher of the seventeenth century. At eighteen he wrote a treatise, in which he explained in a very simple manner Theodosius's three books of Spherics; to which he added a tract upon trigonometry, designed as an introduction to astronomy. He next published his Astronomia Physica. In 1666 M. Colbert proposed to Louis XIV. a scheme for establishing a royal academy of sciences; and appointed Du Hamel secretary. He was also regius professor of philosophy, and published a great number of books. He died at Paris in 1706, aged eighty-three. He wrote Latin with purity and elegance.

HAMELN, a town and fortress of hanover, situated at the conflux of the Weser and Hamel. Here is a large sluice on the Weser, crected in 1734, by George II. It contains 5000 inhabitants, and carries on an active trade in tobacco, hats, and woollens. The churches and other public buildings are large for so small a place. On the other side of the river is a very strong fortification, called Fort George, considered of great importance for the possession of Hanover. It was garrisoned by the Prussians in 1806. Twenty-two miles south-east of Minden, and twenty-five south-west of Hanover.

HAMELIA, in botany, a genus of the monogynia order, and pentandria class of plants. The corolla is quinquefid; the berry quinquelocular, inferior, polyspermous.

HAMÉSÉCKEN, or HAMESOKEN. Burglary, or nocturnal house-breaking, was, by the ancient English law, called Hamesecken, as it still is in Scotland.

HAMILCAR, the father of Hannibal. See AMILCAR and CARTHAGE.

HAMILTON (George), carl of Orkney, a brave warrior, was the fifth son of William earl of Selkirk. Being made colonel in 1689—90, he distinguished himself by his bravery at the battle of the Boyne; and soon after at those of Ahrim, Steinkirk, and Landen, and at the sieges of Athlone, Limerick, and Namur. His ciminent services in Ireland and Flanders, recommended him so highly to king William III. that, in 1696, he created him earl of Orkney; and his lady, the sister of Edward viscount Villiers, afterwards earl of Jersey, had a grant made to her, under the great seal of Ireland, of almost all the private estates of the late king James. Upon the accession of queen Anne, he was promoted to the rank of major-general in 1702, and in 1703 to that of lieutenant-general, and was likewise made K. T. He afterwards served under the duke of Marlborough, and contributed by his bravery and conduct to the glorious victories of Blenheim and Malplaquet. In 1710 he was sworn of the privy-council, and made general of the foot in Flanders. In 1712 he was made colonel of the royal regiment of Fusiliers, and served in Flanders under the duke of Ormond. In 1714 he was appointed gentleman extraordinary of the bed-chamber to king George I., and afterwards governor of Virginia. At length he was appointed governor of Edinburgh castle, lordheutenant of Clydesdale, and field-marshal. He died at his house in Albemarle Street, in 1737.

HAMILTON (John), the twenty-fourth bishop of St. Andrew's, to which he was translated from Dunkeld, was the natural son of James, the first earl of Arran; and one of queen Mary's privy council, and a steady adherent to her interest. Ile baptised her son; and was made lord privy seal, and lord treasurer. By the regent earl of Murray, he was declared a traitor, and obliged to seek shelter among his friends. Being in the castle of Dumbarton, when it was taken, he was carried to Stirling, where on April 1st, 1570, he was hanged on a tree. The following sarcastic lines were written upon it :--

Vive diu, felix arbor, semperque vireto Frondibus, ut nobis talia poma feras.

HAMILTON (William), of Bangour, a celebrated Scots poet, the friend and poetical correspondent of Allan Ramsay, was born at Bangour, in , Linlithgowshire, in the beginning of the eighteenth century, and was for some time a lieutenant in the royal navy. Lieutenant Hamilton lived many years at Gilbertfield in Lanarkshire, and afterwards at Latrick, where he died 24th of May, 1751. His works were printed at Edinburgh, in 12mo., in 1760.

IIAMILTON (William Gerard), an orator of the last century, who, on account of the extraordinary impression produced by the first and almost the only speech he ever delivered in the house of commons, obtained the name of Single-speech Hamilton. His father was a barrister of Lincoln's Inn, where he was born in 1729. He was sent to Winchester, whence he removed to Oriel College, Oxford; and then studied at Lincoln's Inn, but never was called to the bar. In 1754 he obtained a seat in parliament, and subsequently was made one of the lords of trade. On the appointment of lord Halifax to the viceroyalty of Ireland, Hamilton went thither as his secretary, and was accompanied by the celebrated Edmund Burke. In the Irish parliament he supported the reputation he had previously gained; and for many years held the office of Irish chancellor of the exchequer. He relinquished that post in 1784, and spent the latter part of his life in retirement. His death took place in 1796. A posthumous publication of his works, including a tract, entitled, Parliamentary Logic; Speeches, &c., appeared in 1808. The letters of Junius have been attributed to him.

HAMILTON (Elizabeth), a modern literary lady,

and a native of Ireland, was born at Belfast 25th of July, 1758. She was brought up under the care of her uncle, who resided near Stirling in Scotland, and produced Cottages of Glenbur-nie; Letters of a Hindoo Rajah, 2 vols. 8vo.; The Life of Agrippina, 3 vols. 8vo.; and Memoirs of Modern Philosophers; works which, under the form of novels, are replete with good sense and information. Her other writings are, Hints for Public Schools; Popular Essays, 2 vols. 8vo.; Rules of the Annuity Fund, &c.; Exercises in Religious Knowledge, 12mo.; Letters on the Formation of the Religious and Moral Principle, 2 vols.; and, On the Elementary Prin-ciples of Education. Miss Benger, after her decease, printed a selection from Miss Hamilton's correspondence, with an account of her life and habits. Her death took place at Harrowgate, in Yorkshire, 23d of July, 1816.

HAMILTON, a town in a parish of the same name, seated on the Clyde, in the middle of a very agreeable plain, on the east side of a large park nearly seven miles in circumference, enclosed with a high wall, full of deer and other game, belonging to the duke of Hamilton. The original name of this place was Cadzow, or Cadyow, a barony granted to an ancestor of the noble owner, on the following occasion :- In the time of Edward II. lived Sir Gilbert de Hamilton, or Hampton, an Englishman of rank ; who happen-ing at court to speak in praise of Robert Bruce, received an insult from John de Spenser, chamberlain to the king, whom he fought and slew. Dreading the resentment of that potent family, he fled to the Scottish monarch; who established him at the place possessed by the duke of Hamilton. In after times the name changed from Cadzow to Hamilton; and in 1445 the lands were erected into a lordship, and the then owner Sir James sat in parliament as lord Hamilton. He founded a collegiate church at Hamilton in 1451; and the town was made a burgh of barony in 1456. Weaving is the chief manufacture. Hamiltonpalace is at the end of the town; a large pile, with two deep wings at right angles with the centre : the gallery is of great extent, and furnished with most excellent paintings. Hamilton is eleven miles south-east of Glasgow, and thirteen N. N. W. of Lanark.

HAMILTON, a county in the south-west corner of the state of Ohio, United States, bounded south by the Ohio River, east by Clermont county, north by Butler county, and west by findiana. It is thirty miles long, by twenty broad. It is watered by the Ohio, Whitewater, and Great and Little Miami. Its surface is hilly and uneven near the large streams; in other parts it is level, or undulating. The valleys are well cultivated. The chief town is Cincinnati. Population, in 1815, 18,700.

HAMILTON, a district of Tennessee, United States, containing the counties of Knox, Jefferson, Blount, Sevier, and Grainger.

HAMILTON, a town of the county of Putler, state of Ohio, United States. It is pleasantly situated on the east bank of the Miami, and contains a post-office, and a printing-office, from which issues a weekly newspaper.

HAMILTON, a township and village of the

United States, in Maddison county, New York, The township was erected in 1801, and in 1810 its inhabitants amounted to 2220. The village is situated on the main branch of the Chenango.

HAMLET, n. s. From Saxon, ham, a village; with the diminutive termination.

- Within the self-same lordship, parish, or hamlet, lands have divers degrees of value. Bacon.
 - Sometimes with secure delight Milton. The upland hamlets will invite.
 - He pitched upon the plain

His mighty camp, and, when the day returned, The country wasted and the hamlets burned. Dryden.

HAMLET, a prince of Denmark whose history has been rendered interesting, by being the subject of one of the noblest tragedies of Shaks-Adjoining to a royal palace, which peare. stands about half a mile from Cronburg in Elsineur, is a garden, which, Mr. Coxe informs us, is called Hamlet's Garden, and is said to be the spot where his father was murdered. The house is of modern date, and is situated at the foot of a sandy ridge near the sea. The garden occupies the side of the hill, and is laid out in terraces rising above each other. The original history, from which the poet derived the principal incidents of his play, is founded upon facts, but so deeply buried in remote antiquity that it is difficult to discriminate truth from fable. Saxo Grammaticus, who flourished in the twelfth century, is the earliest historian of Denmark who relates the adventures of Hamlet. His account is much altered by Belleforest, a French author, a translation of whose romance was published under the title of The Hystorye of Hamblet, from which Shakspeare is supposed to have formed the ground-work of his play.

HAM'MER, n. s. & v. n. Saxon, pamer. Danish, hammer.

The HAM'MERHARD, n. s. instrument, consisting of a long handle and heavy head, with which any thing is forged or driven. Figuratively any thing destructive or powerful: to beat; to forge; to contrive by dint of intellectual labor; to work; or to be busy; in these senses generally spoken contemptuously: sometimes to be greatly agitated.

Lamekes sone Tubal,

That found out firste the arte of song ;

For as his brother's hamers ronge

Upon his anyelt up and downe,

Therof, he toke the firste sowne.

Chaucer. Boke of the Duchesse. The armureres also

With file and hammer pricking to and fro.

Id. The Knightes Tale.

His bones the hammered steel in strength surpass.

Sandys.

Nor needest thou much importune me to that, Whereon this month I have been hammering.

Shakspeare.

Id.

I have been studying how to compare This prison where I live unto the world ; And, for because the world is populous,

And here is not a creature but myself,

I cannot do it ; yet I'll hammer on't. Id.

Vengeance is in my heart, death in my hand ; Blood and revenge are hammering in my head. Id. The armourers,

With busy hammers closing rivets up,

Give dreadful note of preparation.

HAM

Wilt thou still be hanimering treachery,

To humble down thy husband and thyself?

He was nobody that could not hammer out of his name an invention by this witchcraft, and picture it accordingly. Camden.

Some spirits, by whom they were stirred and guided in the name of the people, hammered up the articles. Hayward.

That renowned pillar of truth and hammer of here. sies, St. Augustine. Hakewill on Providence.

- the hammered cuirass,

Chalybean tempered steel, and frock of mail

Adamantean proof. Milton. Samson Agonistes.

It is broken not without many blows, and will break the best hammers of iron. Browne.

The smith prepares his hammer for the stroke.

Dryden's Juvenal.

Id.

Some hammer helmets for the fighting field. Dryden.

Drudged like a smith, and on the anvil beat, 'Till he had hammered out a vast estate. Id.

I must pay with hammered money instead of milled.

Hammerhard is when you harden iron or steel with much hammering on it. Moxon.

Every morning he rises fresh to his hammer and his anvil. South.

There beings deathless as their haughty lord Are hammered to the galling oar for life,

And plow the winter's wave and reap despair.

Young's Night Thoughts.

The first an hammer called, whose out-grown sides Lie on the drum. Fletcher's Purple Island.

A HAMMER has an iron head, fixed crosswise upon a handle of wood. There are several sorts of hammers used by blacksmiths; as, 1. The hand-hammer, which is of such weight that it may be wielded with one hand at the anvil. 2. The up-hand sledge hammer, used with both hands, and seldom lifted above the head. 3. The about-sledge hammer, which is the biggest of all, and held by both hands at the farthest end of the handle; and being swung at arm's length over the head, is made to fall upon the The work with as heavy a blow as possible. smallest hammer used by smiths is called a rivetting hammer, but is seldom used at the forge unless upon small work. These and a great variety of other hammers of different sizes are used by goldsmiths and jewellers. Watchmakers, saddlers, carpenters, and joiners, have likewise hammers accommodated to their several purposes.

HAMMERMEN, in the royal boroughs of Scotland, the name of an incorporation, which comprehends most of those artizans who make use of hammers; such as goldsmiths, jewellers, watch-makers, coppersmiths, braziers, blacksmiths, tin-plate-workers, cutlers, gun-smiths, founders, saddlers, &c. In Edinburgh, however, the goldsmiths, by the set of the burgh, form a distinct incorporation, which ranks second in order, next to the surgeons; while the other artizans above mentioned form the fifth incorporation, under the title of hammermen.

HAMMOCK, n. s. Sax. pamaca. A swinging bed.

Prince Maurice of Nassau, who had been accustomed to hammocks, used them all his life. Temple.

10

11

HAMMOCKS, or HAMACS, are suspended between two trees, posts, hooks, or the like, and are much used throughout the West Indies, as well as on board of ships. The Indians hang their hammocks to trees, to secure themselves from wild beasts and insects. It consists of a large strong coverlet or sheet of coarse cotton, about six feet square; on two opposite sides are loops of the same stuff, through which a string is run, and thereof other loops are formed, all of which are tied together with a cord; and thus the whole is fastened to two neighbouring trees in the field, or two hooks in houses. This kind of couch serves at the same time for bed, quilts, sheets, pillow, &c. The hammock used on board of ships is made of a piece of canvas, six feet long, and three wide, drawn together at the ends. There are usually from fourteen to twenty inches in breadth allowed between decks for every hammock in a ship of war; but this space must in some measure depend on the number of the crew, &c. In time of battle the hammocks and bedding are firmly corded and fixed in the nettings on the quarter deck, to preserve the men from the fire of the enemy.

HAMMOND (Henry), D. D., one of the most learned English divines in the seventeenth century, was born in 1605. He studied at Oxford, and in 1629 entered into holy orders. In 1633 he was made rector of Penshurst in Kent; in 1643 archdeacon of Chichester; and in 1645 a canon of Christ Church, Oxford, and chaplain to king Charles I. He was also chosen public orator of the university. In 1647 he attended the king in his confinement at Wooburn, Cavesham, Hampton-Court, and the Isle of Wight. On his return to Oxford he was chosen sub-dean; and continued there till the parliament visitors ejected and imprisoned him. During this confinement he began his Annotations on the New Testament. On the 4th of April 1660 he was seized by a fit of the stone, of which he died on the 25th of that month, aged fifty-five. He wrote many other works, which have been published together in 4 vols. folio.

HAMMOND (Anthony), esq., an ingenious English poet, descended from a good family of Somersham-Place in Huntingdonshire, was born in 1668. After a liberal education at St. John's College, Cambridge, he was chosen M.P. for Truro, and soon distinguished himself as a speaker. He became a commissioner of the royal navy, which place he quitted in 1712. He published a Miscellany of Poems by the most eminent hands; in which he himself had a considerable share. He wrote the life of his friend Walter Moyle, esq., prefixed to his works; and died about 1726.

HAMOAZE, a creek in the British Channel, which forms a harbour for the royal navy, capable of containing 100 vessels, in three tiers, at from thirteen to fifteen fathoms water. It is the west branch of the Tamar, which falls into Plymouth Sounds.

HAMPDEN (John) esq., of Hampden, a celebrated patriot, descended of an ancient family in Buckinghamshire, was born at London in 1594. He was cousin german to Oliver Cromwell, and in 1609 was sent to Magdalen College, Oxford,

whence he went to the inns of court, where he made a considerable progress in the law. He was elected a member of the parliament which sat at Westminster, February 5th, 1626; and served in all the succeeding parliaments in the reign of Charles I. In 1636 he became universally known, by his refusal to pay ship-money, as being an illegal tax; upon which he was prosecuted; and his conduct throughout this transaction gained him great celebrity. On January the 3rd, 1644, the king ordered articles of high treason and other misdemeanors to be prepared against lord Kimbolton, Mr. Hampden, and four other members of the House of Commons, and went to that house to seize them : but they had retired. Mr. Hampden afterwards made a speech to the house to clear himself of the charge laid against him. In the beginning of the civil war he commanded a regiment of foot, and was of great service to the parliament at the battle of Edge-hill. He received a mortal wound in the shoulder in an engagement with prince Rupert, on the 18th of June 1643, at Chalgravefield in Oxfordshire; and died on the 24th. Of this celebrated patriot Clarendon says, he was an enemy not to be wished where he might have been made a friend, and as much to be apprehended where he was so, as any man could deserve to be. And, therefore, his death. was no less pleasing to the one party, than it was condoled by the other. In a word, what was said of Cinna might well be applied to him ;---'He had a head to contrive, and a tongue to persuade, and a hand to execute any mischief!'

HA'MPER, n.s. Contracted, according to Minsheu, from hand pannier; but hanaperium appears to have been a word long in use, whence hanapar, hampar. Johnson. A large basket for carriage.

What powder'd wigs ! what flames and darts ! What hampers full of bleeding hearts ! Swift.

HAMPER, v. a. The original of this word, in its present meaning, is uncertain: Junius observes that hamplyns in Teutonic is a quarrel: others imagine that hamper or hanapar, being the treasury to which fines are paid, to hamper, which is commonly applied to the law, means originally to fine. To shackle, entangle, ensnare, or inveigle, as with chains or nets; figuratively to perplex, complicate, or embarrass by troubles, or to catch with allurements.

And if the priest wol him refuse,

I am full redy him to accuse,

And him punish and hamper so That he his churche shal forgo.

Chaucer. Romaunt of the Rose.

She'll hamper thee, and dandle thee like a baby.

Shakspeare.

O loose this frame, this knot of man untie ! That my free soul may use her wing,

Which now is pinioned with mortality,

As an entangled, hampered thing. Herbert. We shall find such engines to assail,

And hamper thee, as thou shalt come of force. Milton. And when they are hampered by the laws,

Release the lab'rers for the cause. Hudibras. Wear under vizard-masks their talents, And mother wits before their gallants;

Until they're hampered in the noose,

Too fast to dream of breaking loose.

Id.

You want to lead

My reason blindfold like a hampered lion, Checked of his noble vigour.

Otway.

They hamper and entangle our souls, and hinder their flight upwards. Tillotson.

What was it but a lion hampered in a net !

L'Estrange.

Engendering heats, these one by one unbind, Stretched their small tubes, and hampered nerves unwind. Blackmore.

HAMPSHIRE, a maritime and most picturesque county of England, situate on the southern extremity of the coast of the kingdom. It is bounded on the north by Berkshire; on the east by Sussex and Surrey; on the south by the English Channel and the Sound, which separate it from that part of the county comprised within the Isle of Wight; and on the west by Dorsetshire and Wiltshire. It extends in length, from north to south, about fifty-five miles; in breadth, from east to west, about forty: its circumference is about 150 miles. Its superficial contents are calculated, from Faden's large map of the county, at 94,000 acres. Exclusive of the ISLE of WIGHT, of which an account will be found under its own name, Hampshire contained, in 1811, 38,887 inhabited houses, and 220,960 inhabitants. It is divided into thirty-nine hundreds and liberties, containing, according to Mr. Driver's Agriculural Survey, 253 parishes; and, according to Mr. Vancouver's Agricultural Survey, 356 parishes, precincts, hamlets, &c. This latter author says, the hundreds are fifty-two. There is one city, Winchester, twenty market-towns, and about 1000 villages. The whole county, including the isles of Wight, Jersey, Guernsey, Sark, and Alderney, is comprehended within the diocese of Winchester, and is included in the western circuit. The town of Southampton is a county of itself, and is the county town, though the quarter sessions are held at the city of Winchester.

Before the Roman invasion this county belonged to the Regni, a tribe of ancient Britons, and the Belgæ, who emigrated from Germany and settled here. They are said to have been the first of the inhabitants who submitted to the Roman yoke. Prior to these Belgic invaders, who drove out the aborigines, little or nothing is known of its history. The Segontiaci inhabited the northern extremity of the county, and the adjoining parts of Berkshire, bordering on the river Ken-net. The Romans included this district in the province named Britannia Prima. Under the Saxon domination, it formed the central portion of the kingdom of the West Saxons. The original name of the county was Gwent, or Y Went, a term descriptive of its open downs. The Saxons changed its name to Hantunscyre, whence comes its present name of Hants or Hampshire.

Fuller, in his quaint manner, says, 'most pure and piercing [is] the air of this shire;' and Speed remarks that the 'air is temperate, though somewhat thicke, by reason of the seas and the many rivers that thorow the shire doe fall.' The air is certainly, for the most part, pure and healthy, especially on the downs, which cross the county from east to west; and it has been observed, that even the vapors in the low ground nearest the

sea are not so pernicious as in other counties .----The surface of the county is beautifully varied with gently rising hills and fruitful valleys, adorned with numerous seats and villages, and interspersed with extensive woodlands. The soils are extremely numerous, but by far the greatest portion tending to chalk. According to Mr. Vancouver's map of the soil and substrata of this county, it appears that the district embracing the woodlands and the wastes of Bagshot, on the Berkshire and Surrey borders, consists of clay, sand, gravel, and peat. The district occupying the entire centre of the county, and extending east and west from the borders of Sussex and Surrey into Wiltshire, is a strong flinty loam and hazel-colored mould on chalk, occasionally veined with gravel, with more or less peat in the valleys. There is, however, a small third district on the eastern border, next the counties of Sussex and Surrey, including Woolmer and Alice Holt Forests, consisting of marl, sand, gravelly loam, clay, and peat; the latter being found chiefly upon the wastes. Light sand and gravelly loanis, intermixed with clay and brick-earth on substrata of argillaceous and calcareous marl, are found in the district of the New Forest, in which, as also in the forest of Bere and Waltham Chase, there is much peat and turf moor on the heath and low grounds. This district has been very ably described by Percival Lewis, esq., F.A.S., in his Historical Enquiries concerning Forests and Forest Laws, with Topographical Remarks upon the Ancient and Modern State of the New Forest, which Mr. Lewis says contains about 92,365 acres, giving as his authority the Fifth Report of the Commissioners of the Land Revenue, founded on the actual survey which took place under their sanction in 1780. The quantity of forest lands in 1809 amounted to 63,845 acres and 2 perches, of which 1192 acres 3 roods and 33 perches were enclosed. The fifth district consists of the chalk of Portsdown and the islands of Portsea and Ilaling; a strong, flinty, and a tender hazelcolored loam prevailing in the islands and low grounds.

The principal rivers are the Avon, the Teste, and the Itchin. The Avon rises in Wiltshire, and enters this county near Fordingbridge, whence it passes through Ringwood, after which it unites with the river Stone in the harbour of Christchurch. The Teste rises in the north part of the county, and, running southward, forms several islands at Stockbridge; thence it passes through Romsey, and enters the Southampton inlet at Redbridge. The Itchin, also called the Abra, has its source at Chilton Candover, near Alresford, whence it pursues a southwardly course through the city of Winchester; thence again southwardly, to its junction with the Southamp-ton Water. This river was made navigable from Southampton to Winchester as early as the reign of William the Conqueror. The bathing and other places of general resort on the shores of this county, during the summer season, are Christehurch, Muddiford, Lymington, and Southampton; with Yarmouth, Cowes, Hithe, Brading, and Shanklin, in the Isle of Wight.-The principal canals are the Basingstoke, the

Redbr.dge, the Andover, the Winchester, and the Southampton.—Corn and hops are among the chief of the agricultural produce of this county. Fuller reckoned in his time honey, wax, and hogs, among its produce. Its sheep and hogs have attained considerable repute: for the latter it is proverbially famous; and this breed is of the largest kind, the farmers encouraging it as the most profitable.

New Forest was at one time exceedingly well stocked with red deer, and there are several still bred in it. The number which this forest was capable of supplying, in the year 1789, was seventy-nine brace and a half; a return which is said to have exceeded any former one which had been made for the preceding forty years. The annual supply, says Mr. Lewis, required by the lord Warden (under whose immediate superintendance they are placed) is sixty-four brace, twenty-three of which ought to be given to his majesty and the Cofferer's Office. Besides these sixty-four brace, several are annually killed by the proprietors of the purlieus, whose right so to do is not, in all instances, confined to the pur-lieu itself. The timber of this forest has been long rapidly declining, and that, says Mr. Lewis, to an alarming extent. In the year 1608 there were 123,927 trees fit for the navy; making 197,405 loads, besides 118,072 loads of dotard and decayed trees. In 1783 there were 12,447 trees fit for the navy, and 596 decayed oaks; making altogether 20,830 loads of timber. The average annual supply to the navy for the last twenty years, up to the year 1811, has been about 885 loads of oak, and 270 of beech. From 3000 to 4000 beech trees are annually marked and cut by the officers of this forest, as assignments of fuel as they are commonly called. The mineralogy of this county presents but few materials to the geologist. There is a little ironstone, and considerable quantities of potters' clay in various parts, besides some stone for building and other purposes.

This county sends twenty members to parliament, exclusive of the Isle of Wight : viz. two for the county; two for Winchester; two for Southampton; two for Christchurch; two for Portsmouth; two for Petersfield; two for Stockbridge; two for Lymington; two for White-church; and two for Andover. It is said, perhaps invidiously, that the Treasury are the proprietors or patrons of this county. Among its eminent natives, may be mentioned Dr. Thomas Bilson, a learned prelate; born at Winchester, 1536; died 1616. Dr. W. Coward, a physician who wrote on materialism; born at Winchester, about 1657; died about 1725. William Curtis, the botanist: born at Alton, about 1746; died 1799. Jonas Hanway; born at Portsmouth, 1712; died 1786. Giles Jacob, author of the Law Dictionary; born at Romsey, 1690; died 1744. William Lily, the grammarian; born at Odiham, about 1466; died 1522. Dr. Robert Lowth, the learned grammarian and prelate; born at Winchester, 1710; died 1787. Sir William Petty, a learned and ingenious projector and writer; born at Romsey, 1623; died 1687. Thomas Sternhold, who assisted Hopkins in turning the Psalms into metre; died

1549. William Warham, an eminent prelate and statesman; born at Okeley; died 1532. Thomas Warton, biographer, antiquary, and poet; born at Basingstoke, 1728; died 1790. Also at the same place his brother, Dr. Joseph Warton, a learned divine, critic, and poet; born about 1722; died 1800. Dr. Isaac Watts, the divine and poet; born at Southampton, 1674; died 1741. William of Wykeham, a learned prelate, statesman, and architect; born 1324; died 1404. Rev. Dr. Edward Young, the poet; born at Upham, 1681; died 1707. The city of Winchester is a bishop's see, and gives the title of marquis to the Poulet family. There are no manufactures of consequence in this county. The few there are consist chiefly of shalloons and coarse woollens. Malt is made in pretty large quantities at Andover.

HAMPSHIRE, an extensive county of Massachusetts, United States; bounded north by the states of New Hampshire and Vermont, south by the state of Connecticut, east by Worcester county, and west by Berkshire. Its principal towns lie on both sides of Connecticut River. These are Springfield the chief town, West Springfield, Northampton, Haddley, Hatfield, Deerfield, and Northfield. It is generally fertile and produces the necessaries of life, and some of its luxuries, in great plenty. It contains fiftyfour townships.

HAMPSHIRE, a county of Virginia, bounded north and north-west by the Potomack River, which divides it from the state of Maryland. It is about sixty miles long and fifty broad. It is well watered by the Potomack. Iron ore and coals have been discovered here. The chief town is Romney.

HAMPSHIRE, NEW, one of the United States of North America, bounded north by Lower Canada, east by Maine, south by Massachusetts, and west by Vermont, from which it is separated by Connecticut River. It is 160 miles long, and from nineteen to ninety broad; containing 9491 square miles. Population, in 1790, 141,885; in 1800, 183,858; and in 1810, 214,460. The number of militia, in 1817, amounted to 25,794.

The counties, number of towns, population, and Chief Towns, are exhibited in the following Table.

Counties.	Towns.	Populat.	Chief Towns.
Cheshire	35	40,988	Charlestown Keene Walpole
Coos	25	3,991	Lancaster
Grafton	35	28,462	flaverhill Plymouth
Hillsborough	40	49,249	Amherst Hopkinton
Rockingham	45	50,175	Portsmouth Exeter Concord
Strafford	$\frac{32}{212}$	41,595	Dover Gilmanton Rochester

The seat of government is Concord; but Portsmouth is much the largest town, and the only sea-port. There are eleven banks in this state.

There is a college at Hanover, and academies are established at Atkinson, Chesterfield, Deerfield, Exeter, Gilmanton, Hampton, Haverhil, Lancaster, Londonderry, Newmarket, New Ipswich, Plainfield, Portsmouth, and Salisbury. Some of these academies, particularly those at Exeter and Plainfield, are liberally endowed. Public schools are supported throughout the state, and afford to all the inhabitants the means of common education.

The following statement respecting the several denominations of Christians was made in the year 1817; Congregationalists, 103 ministers; Baptists, fifty-three churches; Friends, eighteen meetings; Methodists, six ministers; Presbyterians, three ministers; Episcopalians, three ministers; Universalists, three ministers; Shakers, two societies. The whole number of houses of public worship, in 1817, was 261.

The climate of New Hampshire is subject to the extremes of heat and cold, but the air is generally pure and salubrious. Morning and evening fires become necessary from about the middle of September. Cattle are housed from the beginning of November; and in the course of this month the earth and rivers generally become thoroughly frozen and covered with snow. The open country is generally cleared of snow in April, but in the woods it very often lies in the northern parts of the state till May.

The whole extent of sea coast in this state, from the southern boundary to the mouth of the Piscataqua harbour, is eighteen miles. The shore is generally a sandy beach, and bordering upon it are salt marshes, intersected by creeks. There are several coves, convenient for fishing vessels, but the entrance of the Piscataqua is the only harbour for ships. For twenty or thirty miles from the sea the country is either level, or variegated by small hills and valleys. Then commences a country the surface of which is greatly diversified by hills, valleys, and several elevated mountains, among which are the White Mountains, accounted the highest in the United States. The other most considerable summits are Moosehillock, Monadnock, Kearsarge, Sunapee, Ossi-pee, &c. Some of the most remarkable natural objects of curiosity are the cave in Chester, the rock in Durham, Bellows Falls in Walpole, and particularly the Notch of the White Mountains.

Five of the largest rivers in New England rise either wholly or in part in this state. These are the Connecticut, Merrymack, Androscoggin, Saco, and Piscataqua. The other most considerable rivers are the Upper and Lower Ammonoosuc, Sugar River, Ashuclot, Contoocook, Margallaway, and Nashua. The principal lakes are Winnipiseogee, Umbagog, Ossipee, Sunapee, Squam, and Newfound lakes.

There is a great variety of soil in this state; a considerable proportion is fertile, and it is generally better adapted to grazing than tillage. The interval lands on the large rivers are esteemed the most valuable. These produce va-

rious kinds of grain in great abundance. But the uplands, of an uneven surface, and of a rocky, warm, moist soil, are accounted the best for grazing. The principal articles of produce are beef, pork, mutton, butter, cheese, wheat, rye, Indian corn, oats, barley, pulse, and flax. The number of neat cattle, in 1812, was calculated at 211,534 ; horses 32,161 ; sheep 564,892. Apples are abundant, and no good husbandman thinks his farm complete without an orchard. Other kinds of fruit are not extensively cultivated.

The manufactures of New Hampshire have of late greatly increased. There are now upwards of thirty cotton and woollen manufactories, and nine or ten paper mills. There is a glass manufactory company in Keene, incorporated in 1814; and there are establishments for the manufacture of iron in Franconia. There are also several furnaces for casting iron, hollow ware, &c. Among the towns where the most considerable manufacturing establishments are situated, are Exeter, Peterborough, Franconia, Pembroke, New Ipswich, Keene, Dover, &c. The principal articles of export are lumber, fish, beef. pork, horses, neat cattle, sheep, flax seed, pot and pearl ashes. The total amount of the exports from Portsmouth, in 1798, was 723,241 dollars; and in 1816, 140,293 dollars.

The executive power is vested in a governor and a council of five members. The legislature is composed of a senate of twelve members, and a house of representatives. Every town containing 150 ratable polls is entitled to send one representative, and one for every additional 300 polls. All the above officers are elected annually by the people, on the second Tuesday in March. The legislature meets annually on the first Wednesday in June. New Hampshire sends six representatives to congress.

New Hampshire was discovered in 1614 by captain Smith; and the first settlements, consisting of fishermen and planters, were established in 1623. In consequence of a disunion among the settlers, they renounced the right of self-government, and placed themselves under the state of Massachusetts. About the year 1680, however, it was again established into a royal government, which was dissolved by the provincial convention of 1775. Its present constitution was adopted in 1784.

HAMPTON, a town of Middlesex, on the Thames, twelve miles W. S. W. of London, and two from Richmond and Kingston. It is chiefly famous for its royal palace, called Hampton Court, built by Cardinal Wolsey, who furnished it richly, and had 280 silk beds here for strangers. The buildings, gardens, and two parks, to which William III. made considerable additions, are about four miles in circumference, and watered on three sides by the Thames. The grand facade along the Thames extends 328 feet; the portico, colonnade, and grand entrance, are executed in a magnificent style of architecture. On a pediment in the front of the palace is a bas-relief of the triumph of Hercules over Envy, opposite to which is a large oval bason. At the entrance of the grand walk are two marble vases of exquisite workmanship, one of them by

Cibber, father of the poet, and the other by a foreigner, they having been executed as a trial of skill; the one has a bas-relief of the triumphs of Bacchus, and the other of Amphitrite and the Nereids. In the parterres are four brass statues of a Gladiator, Apollo, Diana, and Saturn. On the south side of the palace is the Privy-Garden, which was sunk ten feet to open a view to the Thames, having a fountain in the centre. The palace consists of three quadrangles; the first and second are gothic; but in the last is a most beautiful colonnade of the Ionic order, in which are the royal apartments.

HAMPTON, a town of the United States, the capital of Elizabeth county, Virginia. It is situated at the head of a bay which runs up north from the head of James's river, called Hampton road, five miles north-west from Point Comfort. Corn and leather are imported from this place to a considerable extent. It is eleven miles north from Norfolk, sixty E. S. E. from Richmond, and 180 west by south from Philadelphia.

HAN, for have, in the plural. Obsolete.

HAN'APER, n. s. Low Lat. hanaperium. A treasury; an exchequer. The clerk of the hanaper receives the fees due to the king for the seal of charters and patents.

The fines for all original writs were wont to be immediately paid into the *hanaper* of the Chancery.

Bacon.

The HANAPER, or HAMPER, is an office in Chancery, under the direction of a master, his deputy and clerks, comptroller, &c., answering, in some measure, to the fiscus among the Romans. The clerk or warden of the hanaper receives also all money due for commissions and writs; and attends the keeper of the seal daily in term time, and at all time of sealing; and takes into his custody all sealed charters, patents, &c., which he receives into bags, but anciently, it is supposed into hampers, which gave name to the office.

HANAU, or HANAU MUNZENBURG, a rich tract of country in the electorate of Hesse-Cassel, extending east and west along the north bank of the Maine, and deriving its name from the town of Hanau, its capital. Its extent is about 470 square miles, and its population 74,000; the prevailing religion is Calvinism. Here are several extensive forests and mines of silver, copper, salt, and cobalt. This territory was formerly a separate government, under the counts of Hanau; but that family becoming extinct in 1736, it has since formed part of the dominions of Hesse-Cassel.

HANAU, a large town of Hesse-Cassel, situated on the Kinzig, not far from its junction with the Maine. It is divided into the old and new town, each of which is distinctly governed. The former is ill built, but contains a magnificent castle, and a good classical school. The new town is much larger and more regular, and has a large square, in which is the councilhouse, and a public well in each corner. The houses in this part are mostly in the Dutch style, having been built by Walloon and Flemish emigrants of the seventeenth century. A

part of its population is also descended from Calvinists, who emigrated from France, under Louis XIV. A canal goes from the Maine to the walls of the town, for the convenience of trade. A large proportion of the inhabitants are employed in manufacturing watches, jewellery, camblets, and hats; but the largest manufacture is that of silk. Wood, iron, corn, and flour, are also articles of traffic. Wilhelmsbad, in the neighbourhood, has a well known mineral spring, and public buildings; this place is also the seat of the supreme court for the district, and is the residence of the elector's deputy, generally the heir apparent. In 1792, Hanau was attacked. but not occupied, by the French: but it was entered by them in 1796, in 1797, and afterwards in 1805. In the end of October 1813, an Austrian and Bavarian corps opposed here the grand army of the French in their retreat from Leipsic, and a sanguinary conflict took place, in which the Bavarians were defeated. Inhabitants 12,000, thirteen miles east of Frankfort on the Maine, thirty S.S.E. of Wetzlar, and twenty-seven east of Mentz. Long. 8° 59' E., lat. 50° 9' N.

HANAU-LICHTENBERG, a principality belonging formerly to a younger branch of the counts of Hanau. It is chiefly in Alsace, but a part of it on the German side of the Rhine. It is now shared between France, Baden, and Hesse-Darmstadt. The population of the whole is calculated at rather more than 80,000.

HA'NCES, or HAUNCHES, in architecture, the ends of elliptical arches; and these are the arches of smaller circles than the scheme, or middle part of the arch.

The sweep of the arch will not contain above fourteen inches, and perhaps you must cement pieces to many of the courses in the *hance*, to make them long enough to contain fourteen inches. Moxon.

HANCOCK, county of Maine, United States, bounded north by Penobscot county, east by Washington county, south by the Atlantic, and west by Lincoln and Kennebeck counties. The chief town is Castine. It is well watered by the Penobscot and Union rivers.

HAND, n.s. Sax. ban's, bon's, and in all the Teutonic dialects. The palm with the fingers; the member with which we hold or use any instrument.

And on a wall this king his eyen cast,

- And saw an hand, armles, that wrote ful fast ;
- For fere of whiche he quoke, and siked sore.
- This hand, that Balthasar so sore agast,

Wrote mane, techel, phares, and no more.

Chaucer. The Monkes Tale. The nectarine and curious peach

Into my hands themselves do reach. Marvell.

They laid hands upon him, and bound him hand and foot. Knolles's History of the Turks.

That wonderful instrument the hand, was it made to be idle? Berkeley.

They hand in hand, with wandering steps and slow, Through Eden took their solitary way. Milton. Each at the head

Levelled his deadly aim ; their fatal hands No second stroke intend.

Measure of four inches; a measure used in the matches of horses; a palm.

Id.

For the other side of the court-gate on this hand, and that hand, were hangings of fifteen cubits. Exod. xxxviii, 15.

Part; quarter; side.

It is allowed on all *hands*, that the people of England are more corrupt in their morals than any other nation this day under the sun. Swift.

Ready payment with respect to the receiver.

Of which offer the bassa accepted, receiving in hand one year's tribute. Knolles's History.

These two must make our duty very easy; a considerable reward in hand, and the assurance of a tar greater recompence hereafter. Tillotson.

Ready payment with regard to the payer. Let not the wages of any man tarry with thee, but give it him out of *hand*. *Tob*. iv. 14.

Rate : price.

Time is the measure of business; money of wares: business is bought at a dear hand, where there is small dispatch. Bacon.

Terms; conditions; rate.

With simplicity admire and accept the mystery; but at no hand by pride, ignorance, interest, or vanity wrest it to ignoble senses.

Taylor's Worthy Communicant It is either an ill sign or an ill effect, and therefore at no hand consistent with humility. Taylor.

Act; deed; external action.

Thou sawest the contradiction between my heart and hand. King Charles.

I venerate the man whose heart is warm, Whose hands are pure, whose doctrine, and whose

life Coincident, exhibit lucid proof

That he is honest in the sacred cause. Cowper.

Labor; act of the hand.

Alnashar was a very idle fellow, that never would set his hand to any business during his father's life. Addison.

I rather suspect my own judgment than I can believe a fault to be in that poem, which lay so long under Virgil's correction, and had his last *hand* put to it. Id.

Performance.

Where are these porters,

These lazy knaves? Ye have made a fine hand! fellows,

There's a trim rabble let in. Shakspeare.

Power of performance.

He had a great mind to try his hand at a Spectator, and would fain have one of his writing in my works. Addison.

A friend of mine has a very fine hand on the violin. Id.

Attempt; undertaking.

Out of them you dare take in hand to lay open the original of such a nation. Spenser on Ireland.

Manner of gathering or taking.

As her majesty hath received great profit, so may she, by a moderate hand, from time to time reap the like. Bacon.

Workmanship; power or act of manufacturing or making.

An intelligent being, coming out of the hands of infinite perfection, with an aversion or even indifferency to be reunited with its author, the source of its utmost felicity, is such a shock and deformity in the beauiful analogy of things, as is not consistent with finite wisdom and perfection. Cheque. I will hear it

With all the tender sufferance of a friend, As calmly as the wounded patient bears The artist's *hand* that ministers his cure. Otway.

Manner of acting or performing. The master saw the madness rise; His glowing cheeks, his ardent eyes; And while he heaven and earth defyed, Changed his hand, and checked his pride.

Dryden.

Agency; part in action.

God must have set a more than ordinary esteem upon that which David was not thought fit to have a hand in. South.

The act of giving or presenting.

Let Tamar dress the meat in my sight, that I may eat it at her hand. 2 Sam. xiii. 5.

To-night the poet's advocate I stand,

And he deserves the favour at my hand.

Addison.

Act of receiving any thing ready to one's hand, when it only waits to be taken.

His power reaches no farther than to compound and divide the materials that are made to his hand; but can do nothing towards the making or destroying one atom of what is already in being. Locke.

Many, whose greatness and fortune were not made to their hands, had sufficient qualifications and opportunities of rising to these high posts. Addison.

Care: necessity of managing

Jupiter had a farm a long time upon his hands, for want of a tenant to come up to his price.

L'Estrange.

Pope.

When a statesman wants a day's defence, Or envy holds a whole week's war with sense, Or simple pride for flattery makes demands, May dunce by dunce be whistled off my hands.

Discharge of duty.

Let it therefore be required, on both parts, at the hands of the clergy, to be in meanness of estate like the apostles: and at the hands of the laity, to be as they who lived under the apostles. Hooker.

Reach; nearness: as, at hand, within reach, near, approaching.

Your husband is at hand, I hear his trumpet.

Shakspeare.

Cousins, I hope the days are near at hand, That chambers will be safe. Id.

He is at hand, and Pindarus is come To do you salutation. Id.

The sight of his mind was like some sights of eyes; rather strong at hand than to carry afar off. Bacon.

Any light thing that moveth, when we find no wind, she wind at hand. Id.

A very great sound near hand hath strucken many deaf. Id.

It is not probable that any body should effect that at a distance, which, nearer hand, it cannot perform. Browne.

When mineral or metal is to be generated, nature needs not to have at hand salt, sulphur, and mercury. Boyle.

Manual management.

Nor swords at *hand*, nor hissing darts afar, Are doomed t' avenge the tedious bloody war.

Dryden.

State of being in preparation.

Where is our usual manager of mirth? What revels are in *hand*? Is there no play, To case the anguish of a torturing hour?

Shakspeure.

State of being in present agitation. I looked upon her with a soldier's eye;

That liked, but had a rougher task in hand

Than to drive liking to the name of war.

Shakspeare.

17

It is indifferent to the matter at hand which way the learned shall determine of it. Locke.

Cards held at a game.

There was never a hand drawn, that did double the rest of the habitable world, before this. Bacon.

That which is used in opposition to another. He would dispute,

Confute, change hands, and still confute. Hudibras.

Scheme of action.

Consult of your own ways, and think which hand Is best to take. Ben Jonson.

They who thought they could never be secure, except the king were first at their mercy, were willing to change the hand in carrying on the war.

Clarendon.

Advantage; gain; superiority.

The French king, supposing to make his hand by those rude ravages in England, broke off his treaty of peace, and proclaimed hostility. Hayward.

Competition; contest;

She in heauty, education, blood, Holds hand with any princess in the world.

Shakspeare.

Transmission; conveyance; agency of conveyance.

> The salutation by the hand of me Paul. Col. v. 18.

Possession; power.

Sacraments serve as the moral instruments of God to that purpose ; the use whereof is in our hands, the effect in his. Hooker.

And though you war, like petty wrangling states, You're in my hand; and, when I bid you cease,

You shall be crushed together into peace. Dryden. Between the landlord and tenant there must be a quarter of the revenue of the land constantly in their

hands. Locke. It is fruitless pains to learn a language, which one may guess by his temper he will wholly neglect, as soon as an approach to manhood, setting him free from a governor, shall put him into the hands of his own

inclination. Locke. Vectigales Agri were lands taken from the enemy, and distributed amongst the soldiers, or left in the hands of the proprietors under the condition of certain duties. Arbuthnot.

Pressure of the bridle.

Hollow men, like horses, hot at hand,

Make gallant show and promise of their mettle.

Shakspeare.

Method of government; discipline; restraint. Menelaus bare an heavy hand over the citizens, having a malicious mind against his countrymen.

2 Mac. v. 23.

He kept a strict hand on his nobility, and chose rather to advance clergymen and lawyers.. Bacon.

However a strict hand is to be kept upon all desires of fancy, yet in recreation fancy must be permitted to speak. Locke.

Influence; management.

Flattery, the dangerous nurse of vice,

Got hand upon his youth, to pleasures bent. Daniel.

That which performs the office of a hand in pointing.

The body, though it moves, yet not changing perceivable distance with other hodies, as fast as the Vot. XI.

ideas of our own minds do naturally follow one another. the thing seems to stand still; as is evident in the hands of clocks and shadows of sun-dials. Locke.

Agent; person employed; a manager.

The wisest prince, if he can save himself and his people from ruin, under the worst administration, what may not his subjects hope for when he changeth hands, and maketh use of the best? Swift.

Giver and receiver.

This tradition is more likely to be a notion bred in the mind of man, than transmitted from hand to hand through all generations. Tillotson.

An act; a workman; a soldier

Your wrongs are known : impose but your commands.

This hour shall bring you twenty thousand hands.

Dryden. Demetrius appointed the painter guards, pleased that he could preserve that hand from the barbarity and insolence of soldiers. Dryden.

A dictionary containing a natural history requires too many hands, as well as too much time, ever to be hoped for. Locke.

Catch or reach without choice.

The men of Israel smote as well the men of every city as the beast, and all that came to hand.

Judges.

A sweaty reaper from his tillage brought First fruits, the green ear, and the yellow sheaf, Unculled as came to hand. Milton.

Form or cast of writing.

Solyman shewed him his own letters intercepted, asking him if he knew not that hand, if he knew not that seal ? Knolles.

Here is the' indictment of the good lord Hastings, Which in a set hand fairly is engrossed ;

Eleven hours I've spent to write it over. Shakspeare.

Being discovered, by their knowledge of Mr. Cowley's hand, I happily escaped. Denham.

If my debtors do not keep their day,

Deny their hands, and then refuse to pay,

Dryden. I must attend.

The way to teach to write is to get a plate graved with the characters of such hand you like. Locke.

Whether men write court or Roman hand, or any other, there is something peculiar in every one's writing. Cockburn.

Constantia saw that the hand writing agreed with the contents of the letter. Addison.

They were wrote on both sides, and in a small hand. Arbuthnot.

I present these thoughts in an ill hand; but scholars are bad penmen, we seldom regard the mechanick part of writing. Felton.

Hand over head. Negligently; rashly; without seeing what one does.

So many strokes of the alarm bell of fear and awaking to other nations, and the facility of the titles, which hand over head have served their turn, doth ring the peal so much the louder. Bacon.

A country fellow got an unlucky tumble from a tree : Thus 'tis, says a passenger, when people will be doing things hand over head, without either fear ov L'Estrunge. wit.

Hand to hand. Close fight.

In single opposition, hand to hand,

He did confound the best part of an hour.

Shakspeare.

He issues, ere the fight, his dread command, That slings afar, and poniards hand to hand, Dryden. Be banished from the field.

 \mathbf{C}

Hand in hand. In union; conjointly.

Had the sea been Marlborough's element, the war had been bestowed there, to the advantage of the country, which would then have gone hand in hand with his own. Swift.

Hand in hand. Fit; pat.

As fair and as good, a kind of hand in hand comparison, had been something too fair and too good for any lady in Brittany. Shakspeare.

Hand to mouth. As want requires.

I can get bread from hand to mouth, and make even at the year's end. L'Estrange.

To bear in hand. To keep in expectation; to elude.

A rascally yea forsooth knave, to bear in hand, and then stand upon security. Shakspeare.

To be hand and glove. To be intimate and familiar; to suit one another.

HAND, v.a. From the noun.

To give or transmit with the hand.

Judas was not far off, not only because he dipped in the same dish, but because he was so near that our Saviour could hand the sop unto him. Brown.

I have been shewn a written prophecy that is handed among them with great secrecy. Addison.

To guide or lead by the hand.

Angels did hand her up, who next God dwell.

Donne.

By safe and insensible degress he will pass from a boy to a man, which is the most havardous step in life : this therefore should be carefully watched, and a young man with great diligence handed over it. Locke.

To seize; to lay hands on.

Let him, that makes but trifles of his eyes,

First hand me : on mine own accord, I'll off.

Shakspeare.

To manage; to move with the hand.

'Tis then that with delight I rove,

Upon the boundless depth of love :

I bless my chains, I hand my oar, Nor think on all I left on shore.

Prior. To transmit in succession, with down; to deli-

ver from one to another. I know of no other way of securing these monuments, and making them numerous enough to be handed down to future ages. Addison.

They had not only a tradition of it in general, but even of several the most remarkable particular accidents of it likewise, which they handed downwards to the succeeding ages. Woodward.

Arts and sciences consist of scattered theorems and practices, which are handed about amongst the masters, and only revealed to the filii artis, 'till some great genius appears, who collects these disjointed propositions, and reduces them into a regular system. Arbuthnot.

One would think a story so fit for age to talk of, and infancy to hear, were incapable of being handed down to us. Pope.

HAND is much used in composition for that which is manageable by the hand, as a handsaw; or borne in the hand, as a handbarrow, &c.

HAND, a member of the human body, at the The extremity of the arm. See ANATOMY. mechanism of the hand is excellently fitted for the various uses and occasions we have for it, and the great number of arts and manufactures in which it is to be employed. It consists of a compages of nerves, and little bones joined into

each other, which give it a great degree of strength, and at the same time an unusual flexibility, to enable it to handle adjacent bodies, lay hold of them, and grasp them, in order either to draw them towards us or thrust them off. Anaxagoras is said to have maintained, that man owes all his wisdom, knowledge, and superiority over other animals, to the use of his hands. The right hand was the place of honor and respect. Amongst the Greeks and Romans it was customary for inferiors to walk on the left hand of superiors, that the right hand might be ready to afford protection and defence to their left side, which, on account of the awkwardness of the left hand, was more exposed to danger.

HAND, in falconry, is used for the foot of the hawk. To have a clean, strong, slender, glutinous hand, well clawed, are good qualities of a hawk or falcon.

HAND, in the manege, is also used for the fore foot of a horse: also for a division of the horse into two parts, with respect to the rider's hand. The fore hand includes the head, neck, and fore quarters; the hind hand is all the rest of the horse.

HANDS are borne in coat armour, dexter and sinister, that is, right and left; expanded or open; and after other manners. A bloody hand in the centre of the escutcheon is the badge of a baronet of Great Britain.

HANDA, Celt. Aonda, i.e. the isle of one color, an inhabited island of Scotland, on the coast of Sutherland, one mile square. It has a large tremendous rock on the north, from eighty to 100 fathoms high, much frequented by seafowls.

HAND-BARROW, n. s. A frame on which any thing is carried by the hands of two men, without wheeling on the ground.

A hand-barrow, wheelbarrow, shovel, and spade.

Tusser.

Set the board whereon the hive standeth on a hand-barrow, and carry them to the place you intend. Mortimer.

HAND-BASKET, n. s. A portable basket.

You must have woollen yarn to tie grafts with, and a small hand-basket to carry them in. Mortimer.

HAND-BELL, n. s. A bell rung by the hand.

The strength of the percussion, is the principal cause of the loudness or softness of sounds; as in ringing of a hand-bell harder or softer. Bacon.

HAND-BREADTH, n. s. A space equal to the breadth of the hand; a palm.

A border of an hand-breadth round about. Exodus. Off goth the skinne, an hondbrede al aboute

Chaucer. The Milleres Tale.

The eastern people determined their hand-breadth by the breadth of barley-corns, six making a digit, and twenty-four a hand's-breadth. Arbuthnot.

From hand. Having HAND'ED, adj. the use of either hand; with hands joined : hander, HAND'ER, n. s. HAND'ILY, adv. HAND'INESS, n. s. one who transmits from HAND'Y, n. s. party to party: handily

with skill or dexterity: handiness, skill; readiness: handy, performed with the hand; dexterous; skilful; convenient; or near.

They were but few, yet they would easily overthrow the great numbers of them, if ever they came to handy Knolles. blows.

Into their inmost bower

Handed they wont. Both parties now were drawn so close, Almost to come to handy blows. Hudibras.

Many are right handed, whose livers are weakly constituted; and many use the left, in whom that part is strongest. Browne.

They would assume, with wondrous art, Themselves to be the whole who are but part, Of that vast frame the church ; yet grant they were The handers down, can they from thence infer A right t' interpret? Or would they alone, Who brought the present, claim it for their own?

Dryden.

She stript the stalks of all their leaves; the best She culled, and them with handy care she drest. Id.

The servants wash the platter, scour the plate; And each is *handy* in his way. Id.

HANDEL (George Frederick), an eminent master and composer of music, born at Halle, in Upper Saxony, on the 24th of February, 1684. His father was a physician in that city, and was upwards of sixty years of age when he was born. During his infancy young Handel amused him-self with musical instruments, and made considerable progress in the science before he was seven years of age. His propensity for music at last became so strong that his father, who designed him for the law, forbade him to touch an in-strument. Handel, however, privately conveyed a small clavichord to a room in the uppermost part of the house, to which he constantly stole when the family were asleep; and thus made such advances in his art as enabled him to play on the harpsichord. He was first noticed by the duke of Saxe Weissenfels on the following occasion. His father went to see another son, by a former wife, who was valet de chambre to the duke, and young Handel, being then in his seventh year, accompanied him. While he was in the duke's court it was impossible to keep him from harpsichords; and he sometimes went into the organ loft at church, and played after service was over. On one of these occasions the duke, happening to go out later than usual, found something so uncommon in his manner of playing, that he enquired for him, and was so much taken with the musical genius he exhibited that he persuaded his father to let him follow his inclinations. On his return to Halle, Handel was placed under Zackaw, the organist of the cathedral, and was even then able to supply his master's place in his absence. At nine years of age he began to compose church services for voices and instruments, and continued to compose one every week for three years. At fourteen he far excelled his master, and was sent to Berlin. The opera was then encouraged by Frederick I. king of Prussia, and under the direction of Buononcini, Attilio, and other eminent Italian masters. Buononcini, being of a haughty disposition, treated Handel with contempt; but Attilio behaved to him with kindness, and he profited much by his instructions. His abilities soon re-commended him to the king, who frequently made him presents. After this he went to Hamburgh, where the opera was little inferior to that of Berlin. Soon after his arrival his father died ; and, his mother being left in narrow circumstances, he thought it necessary to procure some

scholars, and to accept a place in the orchestra. At this time the first harpsichord in Hamburgh was played by one Keser, who also excelled in composition; but he, having involved himself in debt, was obliged to abscond. Upon this vacancy, the person who had been used to play the second harpsichord claimed the first by right of succession; but was opposed by Handel, who founded his claim solely upon his abilities. After much dispute it was decided in favor of Handel; but his antagonist, as they were coming out of the orchestra, made a push at Handel's breast with a sword, which must undoubtedly have killed him, had there not fortunately been a music-book in the bosom of his coat. Handel, though yet but in his fifteenth year, became composer to the house : and the success of Almeria, his first opera, was so great, that it ran thirty nights without interruption. Within less than a year after this he set two others, called Florinda and Norene, which were received with equal applause. During his stay here, which was about four or five years, he also composed a considerable number of sonatas, which are now lost. His talents now procured him the acquaintance of many persons of note, particularly the prince of Tuscany, brother to John Gaston de Medicis, the grand duke. This prince pressed him to go with him to Italy; but this offer Handel declined, being resolved not to give up his independence for any advantage that could be offered him. In his nineteenth year Handel took a journey to that country, where he was received with the greatest kindness by the prince of Tuscany, as well as by the grand duke; and notwithstanding the difference between the style of the Italian music and the German, to which Handel had hitherto been accustomed, he set an opera called Roderigo, which pleased the grand duke so well that he was rewarded with 100 sequins and a service of plate. After staying about a year in Florence he went to Venice, where he is said to have been first discovered at a masquerade, by his exquisite performance on the harpsichord. Here he composed his opera called Agrippina, which was performed twenty-seven nights successively, with the highest applause. From Venice he proceeded to Rome, where he became acquainted with cardinal Ottoboni and many other dignitaries, by whom he was frequently attacked on account of his religion; but Handel declared he would live and die in the religion in which he had been educated. He now composed an oratorio called Resurrectione, and 150 cantatas, besides some sonatas and other music. Ottoboni contrived to have a trial of skill between him and Dominici Scarlatti. When they came to the organ Scarlatti himself yielded the superiority to Handel. From Rome Handel went to Naples; after which he paid a second visit to Florence: and at last, having spent six years in Italy, set out for his native country. In his way thither he was introduced at the court of Hanover by baron Kilmanseck ; when the elector (afterwards king George I.) offered him a pension of 1500 crowns a year, as an inducement for him to continue. This offer he declined, on account of his having promised to visit the court of the elector palatine. The elector, being made

C 2

acquainted with this objection, generously ordered him to be told, that his acceptance of the pension should not restrain him from his proinise, but that he should be at full liberty to be absent a year or more if he chose it. Soon after the place of master of the chapel was bestowed upon Handel; and having visited his mother, who was now aged and blind, and his old master Zackaw, and staid some time at the court of the elector palatine, he set out for England, where he arrived in 1710. Operas were then a new entertainment here, and Handel set a drama called Rinaldo, which was performed with uncommon success. Having staid a year in this country he returned to Hanover; but, in 1712, again came over to England; and, the peace of Utrecht being concluded a few months afterward, he composed a grand Te Deum and Jubilate on the occasion. He now found the nobility very desirous that he should resume the direction of the opera house in the Hay Market; and queen Anne having added her authority to their solicitations, and conferred on him a pension of £200 a year, he remained in Britain till the death of the queen and the accession of king George I.; who added a pension of £200 a year to that bestowed by queen Anne; and this was soon after increased to £400, on his being appointed to teach the young princesses music.

In 1715 Handel composed his opera of Amadige; but from that time to 1720 he composed only Teseo and Pastor Fido. About this time a project was formed by the nobility for erecting a kind of academy at the Hay Market, to secure to themselves a constant supply of operas composed by Handel, and performed under his direction. No less than £50,000 were subscribed for this scheme, and it was proposed to continue the undertaking for fourteen years. Handel went over to Dresden, to engage singers, and returned with Senesino and Duristanti. Buononcini and Attilio had still a strong party, but not equal to that of Handel; and therefore in 1720 he obtained leave to perform his opera of Radamisto. The house was so crowded that many fainted; and $\pounds 2$ were offered by some for a seat in the gallery. The contention, however, still ran very high between Handel's party and that of the two Italian masters. It was on this occasion that dean Swift wrote the following epigram :---

> Some say that signior Buononcini Compared to Handel's a mere ninny : Others do swear that to him Handel Is hardly fit to hold the candle. Strange that such high contests should be Twixt Tweedle-dum and Tweedle-dee !

At last it was determined that the rivals should be jointly employed in an opera, in which each should take a distinct act, and he who by the general suffrage was allowed to have given the best proof of his ability should be put in possession of the house. This opera was called Muzio Scævola, and Handel set the last act. It is said that Handel's superiority was owned even in the overture; but, when the act was performed, there remained no pretence for doubt. The academy was now firmly established, and Handel conducted it for nine years with great success;

but about that time an irreconcileable enmity took place between him and Senesino; whom Handel resolved to dismiss, and the nobility re-solved not to permit him. The haughtiness of Handel's temper would not allow him to yield, and the affair ended in the dissolution of the academy. His audience dwindled away, and the offended nobility raised a subscription against him, to carry on operas in the play-house in Lincoln's Inn Fields. Against this opposition Handel bore up four years : three in partnership with Heidegger, and one by himself: but, though his own musical powers were superior to those of his antagonists, the astonishing voice of Farinelli, whom the opposite party had engaged, determined the victory against him. At last Handel, having spent all he was worth in a fruitless opposition, desisted ; but was deranged for some time after, and his right arm was rendered useless by a stroke of the palsy. In this deplorable situation he was sent to the baths of Aixla-Chapelle; from which he received relief. Returning to England, in 1736, his Alexander's Feast was performed with applause at Covent Garden. The success and splendor of the Hay Market was by this time so much reduced by mismanagement, that lord Middlesex undertook the direction of it himself, and applied to Handel for composition. He accordingly composed his operas called Faramondo and Alessandro Severo, for which, in 1737, he received £1000. In 1738 he had £1500 from a single benefit, and nothing seemed wanting to retrieve his affairs, except such concessions on his part as his opponents had a right to expect. These, however, he could not be prevailed upon to make; and refused to enter into any engagements upon subscription. After having tried a few more operas at Covent Garden, without success, he introduced that species of music called oratorios, which he thought better suited to the gravity of an English audience. This was by some thought a profanation. and the oratorios at first met with little success ; so that in 1741 Handel again quitted England, and went to Dublin. His Messiah here brought him into universal favor. In nine months he had brought his affairs into order; and on his return to England, in 1742, found the public more favorably disposed towards his oratorios. His Messiah became a great favorite; and Handel, with a generous humanity, determined to perform it annually for the benefit of the Foundling Hospital. In 1743 he had a return of his paralytic disorder; and in 1751 became quite blind. This last affliction sunk him into the deepest despondency; and, finding it impossible to manage his oratorios alone, he was assisted by Mr. Smith, with whose aid they were continued till within eight days of his death. During the latter part of his life his mind was often disordered, yet at times it appears to have resumed its full vigor, and he composed several songs, choruses, &c. From October, 1758, his health declined very fast. On the 6th of April, 1759, his last oratorio was performed, at which he was present, and he died on the 14th. On the 20th he was buried in Westminster Abbey. His musical powers are best expressed by Arbuthnot's reply to Pope, who seriously asked his opinion of him as a musician; 'Conceive,' said he, 'the highest you can of his abilities, and they are much beyond any thing you can conceive.'

HAND'FAST, n. s. Hand and fast. Hold; custody. Obsolete. Thou shalte stond by the post,

As thou were honde-fast.

Chaucer. The Cokes Tale. If that shepherd be not in handfast, let him fly. Shakspeare.

HAND-FASTING, an ancient custom which formerly took place in various parts of Scotland every year. At a stated time it was the custom for the unmarried persons of both sexes to choose a companion with whom they were to If they were live till that time next year. pleased with each other at that time, then they continued together for life; if not, they separated, and were free to make another choice as at first. The fruit of their connexion, if there were any, was always attached to the disaffected person. A priest, whom they named Book i' bosom, because he carried in his bosom a bible or a register of the marriages, came from time to time to confirm the marriages. Mr. Brown traces this custom from the Romans.

HANDFUL, n. s. As much as the hand can grasp, or contain; sometimes expressive of length, or distance, rather than quantity; also a small quantity by comparison.

Being in possession of the town, they had their handful to defend themselves from firing. Raleigh.

Take one vessel of silver and another of wood, each full of water, and knap the tongs together about an handful from the bottom, and the sound will be more resounding from the vessel of silver than that of wood. Bacon.

He could not, with such a handful of men, and without cannon, propose reasonably to fight a battle. Clarendon.

The peaceful scabbard where it dwelt,

The rancour of its edge had felt;

For of the lower end two handful

It had devoured, it was so manful. Hudibras I saw a country gentleman at the side of Rosamond's pond, pulling a handful of oats out of his pocket, and gathering the ducks about him. Addison.

HA'ND-GALLOP, n. s. A slow and easy gallop, in which the hand presses the bridle to hinder increase of speed.

Ovid, with all his sweetness, has as little variety of numbers and sounds as he: he is always upon a hand-gallop, and his verse runs upon carpet ground.

Dryden.

HAND-GUN, n. s. A gun wielded by the hand.

Guns have names given them, some from serpents or ravenous hirds, as culverines or colubrines; others in other respects, as cannons, demicannons, handguns, and muskets. Camden.

HAND'ICRAFT, n. s. Manual occupa-HAND'ICRAFTSMAN, n. s. 5 tion: a man who lives by manual labor.

O miserable age! virtue is not regarded in handicraftsmen. Shahspeare.

He has simply the best wit of any handicraftsman iu Athens. Id.

The principal bulk of the vulgar natives are tillers of the ground, free servants, and handicraftsmen; as smiths, masons, and earpenters. Bacon.

The covenants thou shalt teach by candle-light, When puffing smiths, aud every painful trade

Of handiorafts, in peaceful beds are laid. Dryden. Particular members of convents have excellent mechanical geniuses, and divert themselves with painting, sculpture, architecture, gardening, and sevcral kinds of handicrafts. Addison.

The prophaneness and ignorance of handicraftsmen, small-traders, servants, and the like, are to a degree very hard to be imagined greater. Swift.

It is the landed man that maintains the merchant and shop-keeper, and handicraftsmen. Id.

The nurseries for children of ordinary gentlemen and handicraftsmen are managed after the same man-Gulliver's Travels. ner.

HAN'DIWORK, n. s. Handy and work. Work of the hand; product of labor; manufacture.

The heavens declare the glory of God, and the firmament sheweth his handiwork. Psalms.

As proper men as ever trod upon neat's-leather have gone upon my handiwork. Shakspeare.

In general they are not repugnant unto the natural will of God, which wisheth to the works of his own hands, in that they are his own handiwork, all happiness; although, perhaps, for some special cause in our own particular, a contrary determination have seemed more convenient. Hooker.

He parted with the greatest blessing of human nature for the handiwork of a taylor. L'Estrange.

HA'NDKERCHIEF, n. s. Hand and kerchief. A piece of silk or linen used to wipe the face, or cover the neck.

He was torn to pieces with a hear: this avouches the shepherd's son, who has not only his innocence, hut a handherchief and rings of his, that Paulina Shakspeare. knows.

She found her sitting in a chair, in one hand holding a letter, in the other her handkerchief, which had lately drunk up the tears of her eyes. Sidney.

Confederate in the cheat, they draw the throng, And cambric handkerchiefs reward the song. Gay.

The Romans did not make use of handkerchiefs, but of the lacinia or border of the garment, to wipe their face. Arbuthnot.

HAN'DLE, v. a. & n. s. Belg. handelen; Swe. handla; Dan. handle. To touch, or feel, with the hand: to manage; to make familiar with: figuratively, to treat; to mention in writing or conversation; to deal with, or practise upon: handle, that part by which any thing is held; and hence, figuratively, that of which use is made.

They that handle the law know me not.

Jerem. ii. 8. Leaving to the author the exact handling of every particular, and labouring to follow the rules of abridg-2 Mac. ment.

He left nothing fitting for the purpose

Untouched, or slightly handled in discourse.

Shakspcare.

Her eyes, he. pir, her cheek, her gait, her voice, Id. Thou handlest in thy discourse.

That fellow handles his bow like a crow-kceper. Id.

Pray you, my lord, give me leave to question ; you Id. shall see how I'll handle her.

Talbot, my life, my joy, again returned ! Id. How wert thou handled, being prisoner?

No hand of blood and hone

Can gripe the sacred handle of our sceptre, Unless he do profane, steal, or usurp.

21

Id.

22

Fortune turneth the handle of the bottle, which is easy to be taken hold of; and after the belly, which Bacon. is hard to grasp.

Of a number of other like instances we shall speak more, when we handle the communication of sounds. Id.

There is nothing but hath a double handle, or at least we have two hands to apprehend it. Taylor.

By Guidas Ubaldus, in his treatise, for the explication of this instrument, the subtilities of it are largely and excellently handled. Wilkins's Dædalus.

They were well enough pleased to be rid of an Clarendon. enemy that had handled them so ill.

A carpenter that had got the iron work of an axe. begged only so much wood as would make a handle L'Estrange. to it.

An incurable shyness is the general vice of the Irish horses, and is hardly ever seen in Flanders, because the hardness of the winters forces the breeders there to house and handle their colts six months every Temple. year.

Of bone the handles of my knives are made, Yet no ill taste from thence affects the blade,

Or what I carve; nor is there ever left

Any unsavory haut-goust from the haft. Dryden. A beam there was, on which a beechen pail Id.

Hung by the handle on a driven nail. The bodies which we daily handle make us perceive, that, whilst they remain between them, they hinder the approach of the part of our hands that press them. Locke.

They overturned him in all his interests by the sure but fatal handle of his own good nature. South.

In an argument, handled thus briefly, every thing Atterbury. cannot be said.

HAND'LESS, adj. Hand and less. Without a hand.

Speak, my Lavinia, what accursed hand

Hath made thee handless? Shakspeare. His mangled myrmidons,

Noseless, handless, hackt, and clipt, come to him, 1d Crying on Hector.

HAND'MAID, n.s. A maid that waits at hand. Those of my family their master slight,

Grown despicable in my handmaid's sight. Sandys. Brave Burgundy, undoubted hope of France !

Stay, let thy humble handmaid speak to thee. Shakspeare.

I will never set politicks against ethicks, especially for that true ethicks are but as a handmaid to divinity and religion. Bacon.

She gave the knight great thanks in little speech, And said she would his handmaid poor remain.

Fairfax.

Heaven's youngest teamed star

Hath fixed her polished car,

Her sleeping Lord with handmaid lamp attending.

Milton.

Love led them on; and faith, who knew them best

Thy handmaids, clad them o'er with purple beams And azure wings, that up they flew so drest, And speak the truth of thee on glorious themes Before the judge. Id.

By viewing nature, nature's handmaid, Art, Makes mighty things from small beginnings great; Thus fishes first to shipping did impart, Their tail the rudder, and their head the prow.

Druden.

Since he had placed his heart upon wisdom, health, wealth, victory, and honour, should always wait on her as her handmaids. Addison.

Then Criticism the Muse's handmaid proved, To dress her charms and make her more beloved. Pope.

And her head drooped as when the lily lies O'ercharged with rain : her summoned handmuids bore Their lady to her couch with gushing eyes.

Byron. Don Juan.

HAND'MILL, n. s. Hand and mill. A mill moved by the hand.

Oft the drudging ass is driven with toil ;

Returning late, and loaden home with gain

Of bartered pitch, and handmills for the grain.

Dryden. HANDS off. A vulgar phrase for keep off; forbear.

They cut a stag into parts ; but, as they were en. tering upon the dividend, hands off says the lion.

L'Estrange. HAND'SAILS, n. s. Sails managed by the hand.

The seamen will neither stand to their handsails, nor suffer the pilot to steer. Temple.

HAND'SAW, n. s. A saw manageable by the hand.

My buckler cut through and through, and my sword hacked like a handsaw. Shakspeare.

To perform this work, it is necessary to be provided with a strong knife and a small handsaw. Mortimer.

HANDSEL, n. s. & v. a. Dutch, hansel, a first gift. The first act of using any thing; the first act of sale. It is now not used, except in the dialect of trade.

The apostles term it the pledge of our inheritance, and the handsel or earnest of that which is to come.

Hooker.

Thou art joy's handsel; heaven lies flat in thee, Subject to every mounter's bended knee. Herbert. In timorous deer he handsels his young paws,

And leaves the rugged bear for firmer claws. Cowley. I'd show you How easy 'tis to die, by my example,

And handsel fate before you. Dryden.

HA'NDSOME, adj. & v.a. Gothic, hand-HAND'SOMELY, adv. Sam; Dut. hand-HAND'SOMELY, adv.) saem, ready, HAND'SOMENESS, n. s. dexterous. These words denote a species of corporeal beauty, and is a general assemblage

of whatever is agreeable in person or figure : in manner, it signifies dignity; grace; elegance; in act, convenience; liberality; generosity.

A carpenter, after he hath sawn down a tree, hath wrought it handsomely, and made a vessel thereof. Wisdom.

Under it he may cleanly convey any fit pillage that Spenser. cometh handsomely in his way.

For a thief it is so handsome, as it may seem it was first invented for him. Id.

For handsomeness' sake, it were good you hang the upper glass upon a nail. Bacon.

Him all repute

For his device in handsoming a suit ;

To judge of lace he hath the best conceit. Donne.

In cloths, cheap handsomeness doth bear the bell.

Herbert.

Accompanying her mourning garments with a doleful countenance, yet neither forgetting handsomeness in her mourning garments, nor sweetness in her doleful countenance. Sidney.

When the kind nymph, changing her faultless shake,

Becomes unhandsome, handsomely to 'scape.

Waller.

Persons of the fairer sex like that handsomeness for which they find themselves to be the most liked. Boyle.

A great man entered by force into a peasant's house, and, finding his wife very handsome, turned the good man out of his dwelling. Addison.

I am finding out a convenient place for an almshouse, which I intend to endow very handsomely for a dozen superannuated husbandmen.

That easiness and handsome address in writing is hardest to be attained by persons bred in a meaner Felton. way.

HAND'-VICE, n.s. Hand and vice. A vice to hold small work in .-- Moxon.

HAND'-WRITING, n. s. Hand and writing. A cast or form of writing peculiar to each hand.

That you beat me at the mart, I have your hand to show :

If the skin were parchment, and the blows you gave me ink,

Your own handwriting would tell you what I think. Shakspeare.

To no other cause than the wise providence of God can be referred the diversity of handwritings.

Cockburn.

23

HA'NDY-DANDY, n. s. A play in which children change hands and places.

See how yond justice rails upon yond simple thief! Hark in thine ear : change places ; and, handy-dandy, which is the justice, which is the thief ? Shakspeare,

Neither cross and pile, nor ducks and drakes, are quite so ancient as handy-dandy.

Arbuthnot and Pope.

HANG, v.a. Preter. and part. pass. hanged or hung, anciently hong. Sax. pangan. All the northern dialects have this word. To suspend; to fasten in such a manner as to be sustained, not below, but above.

Strangely visited people he cures ;

Hanging a golden stamp about their necks ;

Put on with holy prayers. Shakspeare.

His great army is utterly ruined, he himself slain in it, and his head and right hand cut off, and hung up hefore Jerusalem. South.

To place without any solid support.

Thou all things hast of nothing made,

That hungest the solid earth in flecting air,

Veined with clear springs, which ambient seas repair. Sandus.

To choke and kill by suspending by the neck, so as that the ligature intercepts the breath and circulation.

But, trewely, by day it may not be,

Men wolden say, that we were theeves strong, And for our owen tresoun don us hong.

Chaucer. The Pardoneres Tale. No painter no close up the piece and see

This crowd of traitors hanged in effigy. Marvell. Thieves at home must hang ; but he that puts

Into his overgorged and bloated purse The wealth of Indian provinces escapes. Cowper.

He hath commission from thy wife and me To hang Cordclia in the prison. Shakspeare.

Hanging supposes human soul and reason This animal's below committing treason ; Shall he be hanged, who never could rebel?

That's a preferment for Achitophel. Dryaen. To display; to show aloft.

This unlucky mole misled several coxcombs; and, like the hanging out of false colours, made some of them converse with Rosalinda in what they thought the spirit of her party. Addison.

To let fall below the proper situation ; to decline.

There is a wicked man that hangeth down his head sadly; but inwardly he is full of deceit.

Ecclus. xix. 26.

The beauties of this place should mourn ;

The immortal fruits and flowers at my return

Should hang their withered head ; for sure my breast Is now more poisonous. Dryden.

The rose is fragrant, but it fades in time ;

The violet sweet, but quickly past the prime ;

The violet sweet, but quickly part and decay; While lilies hang their heads, and soon decay; Id. And whiter snow in minutes melts away.

The cheerful birds no longer sing ; Each drops his head, and hangs his wing.

Prior. To fix in such a manner as in some directions to be moveable.

The gates and the chambers they renewed, and hanged doors upon them. 1 Mac. iv. 57.

To cover or charge by any thing suspended. Hung be the heavens with black, yield day to night ! Shaksveare.

The pavement ever foul with human gore ; Heads and their mangled members hung the door.

Dryden.

To furnish with ornaments or draperies fastened to the wall.

Musick is better in chambers wainscotted than Bacon. hanged.

If e'er my pious father for my sake

Did grateful offerings on thy altars make,

Or I increased them with my sylvan toils,

And hang thy holy roofs with savage spoils,

Dryden. Give me to scatter these.

Sir Roger has hung several parts of his house with Addison. the trophies of his labours.

Thus o'er the dying lamp the unsteady flame,

Hangs quivering on the point, leaps off by fits And falls again as loth to quit its hold. Id.

HANG, v.n.

To be suspended; to be supported above, not below.

Over it a fair portcullis hung

Which to the gate directly did incline,

With comely compass and compacture strong.

Spenser.

To depend; to fall loosely on the lower part; to dangle.

Upon her shoulders wings she wears,

Like hanging sleeves, lined through with cars. Hudibras.

If gaming does an aged sire entice,

Then my young master swiftly learns the vice, And shakes in hanging sleeves the little hox and dice.

Dryden.

To bend forward.

By hanging is only meant a posture of bending for-Addison. ward to strike the enemy.

To float; to play.

And fall these sayings from that gentle tongue,

Where civil speech and soft persuasion hung? Prior.

To be supported by something raised above the ground.

Whatever is placed on the head may be said to hang; as we call hanging gardens such as are planted Addison. on the top of the house.

To rest upon by embracing.

She hung about my neck, and kiss on kiss Shakspearc. She vied.

To-day might I, hanging on Hotspur's neck,

Have takked of Monmouth's grave. Id. Faustina is described in the form of a lady sitting upon a bed, and two little infants hanging about her neck. Peacham.

To hover; to impend.

He hath a heavenly gift of prophecy;

And sundry blessings hang about his throne,

That speak him full of grace. Shakspeare. Odious names of distinction, which had slept while the dread of popery hung over us, were revived.

Atterbury.

To be loosely joined.

Whither go you ?

- To see your wife : is she at home?

-Ay, and as idle as she may hang together.

Shakspeare.

To drag; to be incommodiously joined. In my Lucia's absence

Life hangs upon me, and becomes a burden. Addison.

To be compact or united : with together.

In the common cause we are all of a piece ; we hang together. Dryden.

Your device hangs very well together; but is it not liable to exceptions? Addison.

To adhere, unwelcomely or incommodiously.

A cheerful temper shines out in all her conversation, and dissipates those apprehensions which *hang* on the timorous or the modest, when admitted to her presence. Id.

Shining landskips, gilded triumphs, and beautiful faces, disperse that gloominess which is apt to *hang* upon the mind in those dark disconsolate seasons. Id.

To rest; to reside.

Sleep shall neither night nor day

Hang upon his penthouse lid. Shakspeare.

To be in suspense; to be in a state of uncertainty.

Thy life shall hang in doubt before thee, and thou shalt fear day and night, and shalt have none assurance of thy life. Deut.

To be delayed; to linger.

A noble stroke he lifted high,

Which hung not, but so swift with tempest fell

On the proud crest of Satan. Milton. Sbe thrice essayed to speak : her accents hung,

And faultering dyed unfinished on her tongue. Dryden.

To be dependent on.

Oh, how wretched

Is that poor man that hangs on princes' favours ! Shakspeare.

Great queen ! whose name strikes haughty monarchs pale,

On whose just sceptre *hangs* Europa's scale. *Prior*. To be fixed or suspended with attention.

Though wondering senates hung on all he spoke,

The club must hail him master of the joke. Pope. To have a steep declivity.

Sussex marl shews itself on the middle of the sides of hanging grounds. Mortimer.

To be executed by the halter.

The court forsakes him, and sir Balaam hangs. Popc.

To decline; to tend down.

His neck obliquely o'er his shoulders *hung*, Pressed with the weight of sleep that tames the strong, Pope. HANG'ER, n. s. Derivatives of hang. Hanger HANG'ER-ON, HANG'ING, n. s. hangs in a depending po-

HANG'ING, n. s. hangs in a depending po-HANG'MAN, n. s. sition; a short broad sword. Hanger-on, a dependent; one who eats and drinks without payment. Hanging, drapery hung against the walls by way of ornament; foreboding death by the halter. Hangman, a public executioner; a term of reproach.

Beforen his triumphe walketh shc,

With gilte chaines on hire necke honging.

Chaucer. The Monkes Tale. One cried, God bless us! and Amen! the other;

As they had seen me with these hangman's hands : Listening their fear, I could not say Amen, When they did say God bless us. Shakspeare.

A storm, or robbery, call it what you will,

Shook down my mellow *hangings*, nay, my leaves, And left me bare to weather. Id.

Surely, sir, a good favour you have; but that you have a hanging look. Id.

Like rich hangings in an homely house,

So was his will in his old feeble body. Id.

Who makes that noise there ? who are you ? --Your friend, sir, the *hangman*: you must he so good, sir, to rise, and be put to death. Id.

Men do not stand

In so ill case, that God hath with his hand

Signed kings blank charters to kill whom they hate ; Nor are they vicars, but *hangmen* to fate. Donne.

Being informed that his breakfast was ready, he drew towards the door, where the hangings were held up. Clarendon.

If the wife or children were absent, their rooms were supplied by the umbræ, or hangers-on. Browne.

This monster sat like a hangman upon a pair of gallows; in his right hand he was painted holding a crown of laurel, and in his left hand a purse of money. Sidney.

Her eyes with scalding rheum were galled and red, Cold palsy shook her head, her hands seemed

withered, And on her crooked shoulders she had wrapped

The tattered remnants of an old striped hanging,

Which served to keep her carcase from the cold.

Otway's Orphan.

Now purple hangings cloath the palace walls, And sumptuous feasts are made in splendid halls. Dryden.

Lucas Van Leyden has infected all Europe with his designs for tapestry, which, by the ignorant, are called ancient hangings. Id.

What Æthiops lips he has!

How full a snout, and what a hanging face! Id. They all excused themselves save two, which two he reckoned his friends, and all the rest hangers on.

L'Estrange.

I never new a critick, who made it his business to lash the faults of other writers, that was not guilty of greater himself; as the *hangman* is generally a worse malefactor than the criminal that suffers by his hand. Addison.

Rome oft has heard a cross haranguing, With prompting priests behind the hanging.

Prior.

He is a perpetual hanger-on, yet nobody knows how to be without him. Swift.

HANGER (George), or colonel Hanger, lord Coleraine, was destined for the army, and a commission was procured for him at an early period of life. He served in America during the war of independence, but was never after25

wards able to obtain a higher rank than that of major of the British legion of cavalry. In 1789 he published An Address to the Army, in reply to strictures by Roderic Mackenzie, on Tarleton's History of the Campaigns of 1780 and 1781, 8vo. He was a very eccentric but amusing companion. On the death of his elder brother he succeeded, in 1814, to his title, which, however, he refused to assume; and when addressed by it he was not at all pleased. He died at his house near the Regent's park in 1824, aged seventy-three, leaving a considerable number of publications, the most interesting and amusing of which is his Life, Adventures, and Opinions, 1801, 2 vols. 8vo. In one of his books he introduced a portrait of himself suspended a la lanterne.

HANG-TCHEOU-FOU, the metropolis of the province of Tche-Kiang, in China. It is, according to the Chinese, the paradise of the earth; and may be considered as one of the richest, best situated, and largest cities of the empire. It is twelve miles in circumference, exclusive of its suburbs; and the number of its inhabitants amounts to more than 1,000,000. It is computed that there are 10,000 workmen within its walls employed in manufacturing silk. A small lake, called Si-hou, washes the bottom of its walls on the west side; its water is pure, and its banks are covered with flowers. Halls and open galleries, supported by pillars, and paved with large flag-stones, are erected on piles upon its banks for the convenience of walking; causeways, cased with cut stone, intersect the lake in different directions; and the openings which are left in them at intervals, for the passage of boats, are covered by handsome bridges. In the middle of the lake are two islands, in which a temple and several pleasurehouses have been built. The emperor has a small palace in the neighbourhood. The city has a garrison of 3000 Chinese, under the command of the viceroy; and 3000 Tartars, commanded by a general of the same nation. It has under its jurisdiction seven cities of the second and third class.

HANIFAH, or HANFA (Aba), surnamed Al Nooma, the most celebrated doctor of the orthodox Mussulmans. He was the son of Thabet, and was born at Coufah in the eightieth year of He founded the sect of the the Hegira. Hanifites, which continues to be the most popular of the four principal sects among the Mussulmans. Like other teachers of new opinions, he suffered persecution during his life, being imprisoned at Bagdad till he died, by the caliph Almansor, for refusing to subscribe to the doctrine of absolute predestination. But his opinions were afterwards brought into such credit by Abou Joseph, a sovereign judge under the caliph Hadi, that to be a Hanifite was reckoned synonymous with being a good Mussulman; and about 335 years after his death, which happened in the 150th year of the Hegira, Schaw Melick built a magnificent monument to his memory, and a college, which he appropriated solely to the professors of Aba Hanifah's doctrines. The most eminent of his successors were Achmed Ben Ali, Al Giaffas, and Al Razzi. A mosque in the temple of Mecca is appropriated to them.

HANK, *n.s.* Isl. Goth. Dan. and Swed. *hank*, a chain or coil of rope; a skein of thread; a tye: a check; an influence. A low word.

Do we think we have the *hank* that some gallants have on their trusting merchants, that, upon peril of losing all former scores, he must still go on to supply? Decay of Piety.

HA'NKER, v. n. Dut. hunkeren. To long importunately; to have an incessant wish: it has commonly *after* before the thing desired. It is scarcely used but in familiar language.

And now the saints began their reign,

For which they had yearned so long in vain,

And felt such bowel hankerings, To see an empire all of kings.

npire all of kings. Hudibras.

Among women and children, care is to be taken that they get not a hankering after these juggling astrologers and fortune-tellers, L'Estrange.

The shepherd would be a merchant, and the merchant hankers after something else. Id.

The wife is an old coquette, that is always hankering after the diversions of the town. Addison.

The republick that fell under the subjection of the duke of Florence, still retains many hankerings after its ancient liberty. Addison.

Do'st thou not *hanker* after a greater liberty in some things? If not, there's no better sign of a good resolution. Calamy.

HANKIUS (Martin), professor of history at Breslau, in the seventeenth century, was born in 1633. He was author of several works of erudition; the most celebrated of which is his treatise De Romanorum rerum Scriptoribus. He died in 1709, aged seventy-six.

HANMER (Jonathan), M. A., a learned English divine, born at Barnstaple about 1605, and educated at Cambridge. He was minister of Bishop's Tawton, and lecturer of Barnstaple; but ejected for nonconformity in 1662. He wrote A View of Ecclesiastical Antiquity, and a Discourse on Confirmation. He died in 1687.

HANMER (Sir Thomas), an eminent English author and statesman, born in 1676, and educated at Westminster and Oxford. He was early elected M. P. for Suffolk, and in 1713 was chosen speaker, an office which he discharged with great impartiality. He published a superb edition of Shakspeare, in 6 vols. 4to., at Oxford, in 1744, with elegant engravings by Gravelot. He died at Suffolk, April the 5th 1746.

HANNA, a fertile province of Moravia, circle of Olmutz, inhabited by a tribe of Sclavonians called Hannaks. Their agriculture is superior to that of their race in general, and they have considerable herds of cattle and poultry. Hanna is about 400 square miles in extent.

HANNIBAL, the son of Hamilcar, the Carthaginian general, has been already noticed under the articles AMILCAR and CARTHAGE; with whose history indeed his life is so blended that we need only to take it up after his leaving that country. Having lost a sea-fight with the Rhodians, through the cowardice of Apollonius, one of the admirals of Antiochus the Great, he fied into Crete, to avoid falling into the hands of the Romans. On his arrival in this island he took sanctuary among the Gortynii; but as he

had brought great treasure along with him, and knew the avarice of the Cretans, he secured his riches by the following stratagem :-- IIe filled several vessels with melted lead, just covering them over with gold and silver. These he dethem over with gold and silver. These he de-posited in the temple of Diana, in presence of the Gortynii, with whom, he said, he trusted all his treasure. Justin tells us, that he left this with them as a security for his good behaviour, and lived for some time very quietly in these parts. He took care, however, to conceal his riches in hollow statues of brass, which he left exposed as things of little value. At last he retired to the court of Prusias king of Bithynia, where he found means to unite several of the neighbouring states with that prince into a con-federacy against Eumenes king of Pergamus, an ally of the Romans; and during the subsequent war several times defeated Eumenes, more through the force of his own genius than the valor of his troops. The Romans, hearing of these important services, despatched T. Quinctius Flaminius as an ambassador to Prusias, in order to procure his destruction. At his first audience he complained of the protection given to that famous general, representing him ' as the most inveterate and implacable enemy the Romans ever had; as one who had ruined both his own country and Antiochus, by drawing them into a destructive war with Rome.' Prusias, to ingratiate himself with the Romans, immediately sent a party of soldiers to surround Hannibal's house. The Carthaginian had contrived seven secret passages from his house, to evade the machinations of his enemies. But, guards being posted at all these, he could not fly. Perceiving, therefore, no possibility of escaping, he had recourse to poison, which he had long reserved for such a melancholy occasion. Then taking it in his hand, ' Let us, said he, deliver the Romans from the disquietude with which they have long been tortured, since they have not patience to wait for an old man's death. Flaminius will not acquire any glory by a victory gained over a betrayed and defenceless person. This single day will be a lasting testimony of the degeneracy of the Romans. Their ancestors gave Pyrrhus intelligence of a design to poison him, that he might guard against the impending danger, even when he was at the head of a powerful army in Italy; but they have deputed a person of consular dignity to excite Prusias impiously to murder one who has taken refuge in his dominions, in violation of the laws of hospitality.' Then, having denounced dreadful imprecations against Prusias, he drank the poison, and expired at the age of seventy years. Cornelius Nepos says, that he put an end to his life by a subtile poison which he kept in a ring. Rollin has contrasted his character with that of Scipio Africanus. He enumerates the qualities which make a complete general; and, having then

given a summary of what historians have related of both commanders, is inclined to give the preference to Hannibal. 'There are, however, he says, two difficulties which hinder him from deciding; one drawn from the characters of the generals whom Hannibal vanquished; the other from the errors he committed.' These have been answered by Mr. Hooke, who has taken some pains to vindicate Hannibal's character, by fully and fairly comparing it with that of Scipio Africanus, and other Roman commanders.

HANNIBALIANUS (Flavius Claudius), nephew of Constantine the Great, was by him appointed king of Pontus, Cappadocia, and Armenia Minor; but was murdered by Constantius II. A. D. 338.

HANNO, a general of the Carthaginians, entered the ocean through the Straits of Gibraltar, and discovered several countries. He would have continued his navigation, had he not been in want of provisions. He wrote an account of his voyage, which Sigismund Gelenius published in Greek at Basil, in 1533. He lived, according to Pliny, when the affairs of the Carthaginians were in the most flourishing condition.

HANOVER, formerly an electorate, but now a kingdom of Germany, is of a compact rectangulaı figure; bounded by the Elbe on the northeast, the German Ocean on the north-west, Dutch Friesland and Prussian Westphalia on the southwest, and the kingdom of Saxony on the southeast. It stretches from 50° 18' to 53° 54' N. lat., and from 6° 58' to 11° 56' E. long. It is about 150 English miles from south-east to north-west, and 100 from north-east to southwest, and comprises a surface of 14,000 square miles, with a population of 1,303,000; which gives about ninety inhabitants to each square mile.

The original state was the duchy of Brunswick, to which Lunéburg was afterwards added; when its princes took the title of dukes of Brunswick Lunéburg. The district of Hoya was subjoined in 1543, and that of Diepholtz in 1585. The principality of Hildersheim was obtained partly in the sixteenth century, and partly in 1815. Osnaburg was annexed in 1648; Verden in 1715, and the duchy of Bremen in 1719. Bentheim was acquired in 1753; East Friesland, Lingen, the lordship of Meppen, and part of the Lordship of Rheina, were all added to the former territory, in 1815. At this period Hanover ceded to Prussia a small district north of the Elbe; and to the grand duchy of Oldenburg, another tract on the western frontier. The dukedom of Brunswick Lunéburg was raised to the electorate of Hanover, in 1692, and to the kingdom of the same name, by the Congress of Vienna, in 1815. It now consists of the following eleven provinces, which, with the chief towns and population, are thus exhibited in Ein Beschreibung des Königreichs Hanover, 1817.

Provinces.	Sq. Miles, English.	Population.	Chief Towns.	Inhabitants.
1. Archbishopric of Bremen, dukedom				
of Verden, and Land Hadeln	2669	191,160	Verden	3,500
2. Dukedom of Lunéburg	4261	245,967	Lunéburg .	10,000
3. Counties of Iloya and Diepholtz .	1424	105,120	Hoya	1,700
4. Principality of Kalenburg, and				
county of Spiegelberg	1046	138,306	Hanover .	25,000
5. Bishopric of Hildesheim	685	128,938	Hildesheim	11,000
6. Principalities of Gottingen and Gru-				
benhagen	1171	178,929	Gottingen .	9,000
7. Bishopric of Osnaburg	925	126,037	Osnaburg .	7,000
8. County of Lingen	132	20,143	Lingen	2,000
9. Circle of Meppen and Emsbuhren.	766	29,541	Meppen .	1,600
10. County of Bentheim	360	24,364	Bentheim .	11,000
11. Principality of East Friesland	1117	125,610	Emden	12,000

These provinces comprehend 107 bailiwics of very various dimensions and population.

The sea-coast of Hanover, particularly towards the mouth of the Elbe, is fertile but flat, and preserved by broad dykes and ditches similar to those of Holland. Here, indeed, is no elevation that can be called mountainous. But southward the celebrated Hartz range extends from the territories of Goshar to the frontier. It is covered with wood, and amply enriched with minerals. The silver mines were discovered so early as 968, and are supposed to have been the first opened in Europe. Iron, copper, lead, zinc. vitriol, and sulphur, are wrought to a great extent. The whole rests upon a bed of granite, which shoots up through the highest of the mountains. Of these, the Brocken, or Blocksberg, consisting entirely of granite, rises to the height of 3500 feet above the sea: a number of huge masses, near its summit, have given rise to a conjecture that it had lost part of its height in consequence of some violent convulsion. The iron mines yield a revenue to the government (i. e. one tenth of the produce), amounting to £115,000 per annum.

The admirer of the majesty of nature will find ample gratification in the scenery of the Hartz; the want of corn fields being compensated by the beauty and extent of the forests, by the bold and picturesque form of the rocks, and the immensity of the view from the top of the Blocksberg. Tradition makes this mountain the resort of all the witches of the north; and the Spectre of Brocken, though a phenomenon perfectly natural, is calculated to strike the ignorant peasant with terror, and even to excite surprise in the philosopher. See HARTZ.

Hanover is watered by the Elbe, the Weser (flowing through the heart of the country), the Ilmenau, the Oste, the Ocker, the Leine, the Ilmenau, the Oste, the Ocker, the Leine, the Ilmenau, the Ems. It has some small fresh water lakes, as the Dummersee, in Diepholtz, about twelve miles in circuit; the Steinhuldermeer, in the province of Kalenburg, about four miles long and two broad; and the Dollart, at the mouth of the Ems (rather an estuary than a lake), twelve miles across. Its canals are all of short course. The Bremen Canal, designed to unite the Hamme, the Oste, and the Schwinge, is scarcely completed; nor the Treckschuit Canal, intended to connect Witmund with Aurich. The Pappenburg Canal is only navigable from the Ems.

Its climate greatly resembles that of the eastern shores of England, but in the south the cold is severe on the mountains, and the country ill adapted to corn. In the valleys both the soil and the climate are more favorable, and all kinds of grain arrive at maturity.

Agriculture is in a very backward state in Hanover; the feudal tenures having as yet been an insuperable bar to improvement.

The chief vegetable productions are grain of all kinds, which she exports; peas, potatoes, flax, hemp, tobacco and madder; wood, which is largely used for fuel, as well as for architectural purposes; pitch, and tar. The rotation of crops usually followed is first a fallow, on which the land is cultivated for potatoes, peas, or flax; then winter corn, either rye or wheat, but chiefly the former, and to them succeeds summer corn, either barley or oats. The increase of grain is not estimated to exceed four for one of the quantity sown. The breeding and fattening of cattle is confined to particular portions. By the latest enumeration, but before some of the last additions of territory, there were 224,500 horses; 675,926 head of horned cattle; 1,540,794 sheep and lambs; 15,728 goats and kids: 176,974 swine; and 1498 asses and mules. The heath land, especially in the province of Luneburg, is largely used for rearing bees. The hives are transported in waggons, at the commencement of the spring, to the more southern countries, where the flowers bloom early, and are afterwards brought back when the heath flowers are fit for them. Large numbers of geese are also kept by the bauers on the moist situations, and their flesh is salted for winter consumption. These two sources of wax, honey, and feathers, yield the principal disposable produce of some provinces.

The manufactures of Hanover are numerous, but of inconsiderable size; few except linen, linen yarn, and domestic utensils, affording a surplus beyond the consumption. Hauseleinwand, or household linen, is made in almost every family: a second sort, called lowentleinen, is also common; the finer linens are only made in some of the cities to a small extent, and almost wholly consumed by the richer families. Sailcloth and hempen linen is made in East Friesland and the duchy of Bremen, and is chiefly exported. Spinning is, indeed, the constant employ of females in the villages during the long winter nights. Stockings, whether of linen, cotton, or worsted, are usually made at home; and, in some parts, much oil is made from linseed. Pottery and paper is made in many parts. In the cities, woollen cloths, silk and cotton goods, hosiery, hats, soap, and leather, are also manufactured. The principal branches of trade that employ capital are the breweries of Hanover, Embeck, and Goslar, and the corn distilleries of the different cities.

Embden, the chief port of Hanover, has a small export trade in hops, rape-seed, oil-cake, fruit, hams, &c.; and, in fruitful years, some corn is exported. The imports consist of tea, coffee, sugar, indigo, tobacco, wine, and superior manufactured articles. The great roads to the fairs of Leipsic and Frankfort, passing through Hanover, create a pretty large commission trade, and give employment to many barges, waggons, horses, and men. On the whole, the exports and imports are said to nearly balance, and the amount to be about $\pounds 500,000$ sterling. This is also about the amount of the national revenue: and the hereditary estates of the king yield another £500,000. The imposts consist of a land-tax, post, carriage, and horse duties; duties on the products of the mines and forests, on salt, coals, turf, mills, and fisheries. Part of the public revenue supports the schools and the university of Gottingen, but the far greater part is devoted to military purposes; Hanover having ten garrison towns, and a force of about 20,000 regular troops. Every soldier may demand his discharge and a pension after twenty years' service : the number of these pensioners is at present considerable; but they are liable to do militia duty. Manufacturing establishments connected with the army are, one of small arms at Hertzberg: one of gunpowder at Hersen, near Hameln; and a cannon foundry in Hanover. The only naval force of Hanover is a brig of war, moored off the city of Stade, to enforce the tolls which all merchant vessels passing up the Elbe are bound to pay, and which amounts to about £5000 sterling The public debt was contracted annually. chiefly in the war of 1756; it never was considerable; and, the sovereign having discharged his part of the capital, the residue due by the states does not exceed $\pounds 2,000,000$. The whole executive government is in the king; and the aristocracy has immense weight; but a legislative assembly of 102 deputies is obtaining an increase of power and consideration. The king is of age at eighteen ; during a minority the states of the kingdom are guardians; and the succession is only in the male line. Should this fail in the present family, that of the duke of Brunswick will succeed. At the diet of the empire Hano ver now occupies the fifth rank, and has four votes in the general assembly.

The legal system is very complicated, being a compound of the old Roman law, the constitution of the empire, and all kinds of provincial customs. Many inferior judges and magistrates are appointed by the proprietors of estates; and some of those nominated by the king are rather by his prerogative as owner of some estates than as the monarch. Some of these jurisdictions have the power of life and death, but the latter is rarely inflicted. A court of appeal at Zell has extensive power, and it is intended to increase its authority. Its decisions are highly esteemed for their equity.

In Hanover there is an equal establishment of Lutherans, Catholics, and Reformed ; the smaller sects of Menonites, Hernhuthers, and others, enjoying full protection. The Lutherans amount to about 1,050,000; the Catholics to 160,000; the Reformed to 90,000; the remainder comprise Jews and the smaller Christian sects. The Lutheran church is regulated by superintendents in Hanover, Stade, Osnabrüch, Hildesheim, Aurich, and Hohnstein. The Catholics have bishops at Osnabrüch, Hildesheim, and Regersburg; and the provinces of Meppen and Eimsbuhren are under the spiritual jurisdiction of the Prussian bishop of Münster. In some of the consistories the Lutherans and Reformed are united. Schools are established in every village; others, somewhat more comprehensive, are provided in the small towns; and in the more populous places are academies, or high-schools, for the education of those farther advanced. There are also seminaries at Hanover and Lunéburg for educating the children of rank of both sexes, from eight to fifteen years of age. One of these, called the Georgianum, has a provision on a liberal footing for forty boys, who are educated either for a, military or a civil profession. The schools of a higher order are well organised ; and the university of Gottingen is universally esteemed in Europe. See GOTTINGEN.

Hanover has the Leipsigen and the Convention standards of money. The public accounts are kept in the latter. The gold coin called Georgs d'or is five rix dollars eight groschen in convention money; or, in Leipsigen money, four rix dollars sixteen groschen. The other gold coin, the gold-gulden, is two rix dollars six groschen in convention, two dollars two groschen in Leipsigen money.

The long measure is the rood of eight ells, of two feet; the foot being twelve inches. Six Hanoverian are equal to five Brabant ells. Land is measured by hufen and morgens. The hufe is thirty morgens, the morgen 120 ruthen, equal to 24.844 Paris feet. The morgen by which wood-land is measured contains 160 ruthen. The liquid measure is the eimen, of 3.136 cubic inches, or the anker of 1.960 cubic inches. The latter makes sixteen stübchens, or thirty-two kannen-sixty-four quartiere, or 128 nosel. The weights in common use are ships-pounds, liespounds, hundreds, and customary pounds. The ships-pound is equal to twenty lies-pounds; the hundred is 110 lies-pounds. The lies-pound is divided into two marks, the mark into eight ounces, the ounce into two loths, the loth into four quentins. The local weights and measures vary.

In respect to manners, the Hanoverians are said to possess all the frankness and simplicity of their ancestors; and the higher classes speak a very pure idiom of the Teutonic language. In the towns, and particularly in the capital, a successful imitation of English habits is observed; but the nobility have too strong prejudices of birth to tolerate much of this. In some places, the descendants of the Wendsor Vandals preserved for a long time the use of the Sclavonic language. The only order of knighthood is the Guelphic, instituted by his present majesty in 1814.

The elector of Hanover is descended from the ancient family of the Guelphs, dukes and electors of Bavaria, one of whom, Henry the Lion, in 1140, married Mande, eldest daughter of king Henry II. of England. Their son Wil-liam succeeded to Brunswick Lunéburg, and his son Otho was created duke thereof. The dominions descended in a direct line to Ernest, who divided them upon his death, in 1546, into two branches, that of Brunswick Lunéburg Wolfenbuttel, and Brunswick Lunéburg Zell. The possessor of the latter, Ernest Augustus, was head of the college of German princes, and married Sophia, daughter of Frederick elector Palatine and king of Bohemia, by Elizabeth, daughter of James I. king of Great Britain. Sophia being the next protestant heir to the house of Stuart, the parliament fixed the crown upon her on queen Anne's demise; and George Lewis, her eldest son, became king of Great Britain in consequence; since which the electors of Hanover have filled the British throne. Hanover has been of course involved in the wars of Great Britain, and in that of 1756 her territory was all along the scene of operations. This war cost her nearly 80,000 men, or a tenth of her population : but her troops acquired high repute.

During the first war with revolutionary France, the neutrality of Hanover was maintained; but in 1801 that country was taken possession of by Prussia; and in 1803 the first act of Buonaparte was to overrun it, and carry off the public property. In 1806 Hanover was ceded by the French to the Prussians ; but, on war breaking out between these nations, the electorate was again occupied by Buonaparte. Part of it was then annexed to the kingdom of Westphalia, and at the end of 1810 Buonaparte declared the country along the coast annexed to France. On the expulsion of the French from Germany, in October 1813, the whole electorate was restored; but the title, in 1815, was changed for that of king of Hanover.

HANOVER, the capital of the foregoing kingdom, and of the principality of Calenberg, is situated in a sandy district on the Leine, a navigable river which joins the Weser. It is in the form of a half-moon, separated by the river into two parts, called the Old and New Town. The general appearance is imposing: the towns, formerly surrounded with walls and ditches, having the ramparts levelled, and laid out into an esplanade and streets, where a very elegant monument has been erected to Leibnitz. Outside of the walls is the Gartengemeinde, consisting of a mixture of houses and gardens. Ou entering the streets, the town has an antiquated aspect, particularly what is called the

Old Town. The materials for building are generally brick, with wooden frame-work. Some houses have the bricks used for the doors and windows only. Inscriptions, denoting the date of building, and containing passages from the Psalms, which formerly appeared on the houses, are now for the most part erased, and improvements are going on with great spirit. The population, which in 1811 was only 21,000, is now nearly 25,000. The New Town, which stands on the right side of the river, is built in good style; and the houses in the new street, called George Strass, facing the rampart, are separated from it by iron chains, suspended on stone pillars.

The elector's palace is a large edifice of late erection, having been destroyed by fire, and re-built in 1791. It is receiving improvements, and will be rendered an elegant modern edifice. The public library, founded by Leibnitz, is also a good building, containing a fine collection of books. There are five Lutheran churches; the Calvinists and Catholics have each their chapels; and the Jews a synagogue. The charitable institutions are an orphan-house, two hospitals, and two poor-houses. For education there is a gymnasium, a female school of industry, and several elementary schools. The Georgianum is a school erected in 1796, for the education of forty sons of Hanoverian nobles, admitted at the age of ten, and paying a small sum on their entrance; after which their education is gratuitous. The other objects of curiosity are the mews, the church of the castle, the gardens of the baroness Deken and of count Walmoden, the wood of Ellenztied, and the Lutheran burial-ground; but, above all, Herrenhausen, a country mansion of the royal family, at some distance from the town. The approach is by a long avenue of lime trees, and the building, though by no means elegant, is respectable, and the grounds laid out with perfect uniformity; the water-works are good, and the garden contains a very superior botanical collection.

HANOVER, a county of Virginia, United States, bounded north-east by Spottsylvania, Caroline, and King William counties, east by New Kent, south by Henrico, south-west by Goochland county, and west by Louisa county; distant from Washington 103 miles. Population 15.082.

from Washington 103 miles. Population 15,082. HANOVER, a post town of Grafton county, New Hampshire, United States, on the east side of the Connecticut; fifty-three north-west of Concord, 102 W. N. W. of Portsmouth, and 115 north-west of Boston: from Washington 495. Population 2135. Dartmouth College is situated in the south-west part of this township, about half a mile east of the river, on a beautiful plain, where there is a handsome village with two congregational meeting-houses; and a handsome bridge across the river, connecting the town with Norwich. Dartmouth College was founded by Dr. Eleazer Wheelock, and chartered by royal grant in 1769. The funds, which were originally created by charitable individuals, have been increased by grants from the legislatures of New Hampshire and Vermont; and afford, at present, an increasing annual income of about 1600 dollars.

HANOVER, or M'Allister's Town, a post town in York county, Pennsylvania, between Cadorus Creek and a branch of the Little Conewago. It is seven miles north of the Maryland line, eighteen miles south-west of York, and 106 west by south of Philadelphia.

HANOVER, New, an island in the Pacific, seen by Carteret in 1767, and said by him to be about thirty miles in length. It presents a flat surface to the north-west, and has a chain of high central mountains extending towards the south-east. The passage between this and New Ireland is full of reefs and islets. The south-west part is situated in long. 148° 27' E., lat. 2° 49' S.

HANRIOT, or HENRIT (Francis), one of the bloody revolutionary leaders of France under the despotism of Robespierre. He was born about 1761 at Nanterre; and, after having been a menial servant and a custom-house officer, in which situations he is said to have behaved with dishonesty, he became a police spy. Attaching himself to the jacobins, he first distinguished himself in directing the massacres which took place in the prisons of Paris September 2nd, 1792; and, continuing his cruel career, was appointed commander of the national guards. Supported by Murat, on the 2nd of June, 1793, he surrounded the Convention with an armed force, and obliged the members to return, and pass decrees of accusation against the Girondists. He acted on all occasions as a faithful partizan of Robespierre, whom, when accused, he in vain endeavoured to support, and was arrested and suffered with his chief by the well-merited axe of the guillotine, July 29th, 1794. He displayed on the scaffold a fearlessness worthy of a better cause.

HANS. See HANSE.

HANSBACH, a town of Bohemia, in the circle of Leitmeritz, with manufactures of paper, cotton, &c. Twelve miles north of Kamnitz.

HANSE, an ancient name for a society or company of merchants ; particularly that of certain cities in Germany, &c., hence called Hanse Towns. The word is Teutonic; and signifies alliance, confederacy, or association. Some derive it from the German words am-see, that is on the sea; as the first Hanse Towns were all situated on the sea-coast : whence they are said to have been first called am-zee-stenen, i. e. cities on the sea; and afterwards, by abbreviation, hansee, and hanse. The Hanse Towns, or the Hanseatic Society, were several maritime cities of Germany, who entered into a league for the mutual protection of their commerce. Bremen and Amsterdam were the first two that formed it; whose trade received such advantage by their fitting out two men of war in each to convoy their ships, that more cities continually entered into the league: even kings and princes made treaties with them, and were often glad of their assistance and protection; by which means they grew so powerful, both by sea and land, that they raised armies as well as navies, enjoyed countries in sovereignty, and made peace or war, though always in defence of their trade, as if they had been a united state or commonwealth .- At this time also many cities, though they had no great interest in trade, or intercourse with the ocean, came into their alliance for the preservation of

their liberties; so that, in 1200, we find no less than seventy-two cities in the list of he Hanse Towns ; particularly Bremen, Amsterdam, Antwerp, Rotterdam, Dort, Bruges, Ostend, Dunkirk, Middlehurgh, Calais, Rouen, Rochelle, Bourdeaux, St. Malo, Bayonne, Bilboa, Lisbon, Seville, Cadiz, Carthagena, Barcelona, Marseilles, Leghorn, Naples, Messina, London, Lubec, Rostock, Stralsund, Stetin, Wismar, Konigsberg, Dantzic, Elbing, and Marienburg. The alliance was now so powerful, that their ships of war were often hired by other princes to assist them against their enemies. They not only awed, but often defeated, all that opposed their commerce; and, particularly in 1358, they took such revenge of the Danish fleet in the Sound, for having interrupted their commerce, that Waldemar III. king of Denmark, for the sake of peace, gave them up all Schonen for sixteen years; by which they commanded the passage of the Sound in their own right.-In 1428 they made war on Erick IX. king of Denmark with 250 sail, carrying on board 12,000 men. These so ravaged the coast of Jutland, that the king was glad to make peace with them. Many privileges were bestowed upon the Hanse Towns by Louis XI., Charles VIII., Louis XII., and Francis I. kings of France; as well as by the emperor Charles V., who had various loans of money from them; and by king Henry III., who also incorporated them into a trading body, in acknowledgment for money which they advanced to him, as well as for the services they did him by their naval force in 1206.

These towns exercised a jurisdiction among themselves; for which purpose they were divided into four colleges or provinces, distinguished by the names of their four principal cities, viz. Lubec, Cologne, Brunswick, and Dantzic, wherein were held their courts of judicature. They had a common stock or treasury at Lubec, and power to call an assembly as often as necessary. They kept warehouses for the sale of their merchandise in London, Bruges, Antwerp, Bergen in Norway, Revel in Livonia, and Novogorod in Muscovy; which were exported to most parts of Europe, in English, Dutch, and Flemish bottoms. One of their principal magazines was at London, where a society of German merchants was formed, called the Steel-yard Company. To this company great privileges were granted by Edward I., but revoked by act of parliament in 1552, in the reign of Edward VI., on a complaint of the English merchants that this company had so engrossed the cloth trade, that in 1551 they had exported 50,000 pieces, while all the English together had shipped off but 1100. Queen Mary I., who ascended the throne the year following, having resolved to marry Philip the emperor's son, suspended the execution of the act for three years : but after that term, whether by reason of some new statute, or in pursuance of that of king Edward, the privileges of the company were no longer regarded, and all efforts of the Hanse Towns to recover this loss were in vain. Another accident that happened to their mortification was while queen Elizabeth was at war with the Spaniards. Sir Francis Drake happening to meet sixty ships in the Tagus, loaded with corn,

belonging to the Hanse Towns, took out all the corn as contraband goods which they were forbid to carry by their original patent. The Hanse Towns having complained of this to the diet of the empire, the queen sent an ambassador thither to declare her reasons. The king of Poland likewise interested himself in the affair, because the city of Dantzic was under his protection. At last, though the queen strove hard to preserve the commerce of the English in Germany, the emperor excluded the English company of merchant adventurers, who had considerable factories at Stade, Embden, Bremen, Hamburg, and Elbing, from all trade in the empire. In short, the Hanse Towns, in Germany in particular, were not only in so flourishing, but in so formidable a state, from the fourteenth to the sixteenth centuries, that they gave umbrage to all the neighbouring princes, who threatened a strong confederacy against them; and, as the first step towards it, commanded all the cities within their dominion or jurisdiction to withdraw from the Hanse, or union. This immediately separated all the cities of England, France, and Italy, from them. The Towns, on the other hand, prudently put themselves under the protection of the empire; and, as the cities just now mentioned had withdrawn from them, so they withdrew from several more, and made a decree among them-selves, that none should be admitted into their society but such as stood within the limits of the German empire, or were dependent thereon; except Dantzic, which continued a member, though it only had been summoned formerly to the imperial diet. By these means they maintained their confederacy for the protection of their trade, as it was begun, without being any more envied by their neighbours. Hereby likewise they were reduced to Lubec, Bremen, Hamburgh, and Dantzic; in the first of which they kept their register, and held assemblies once in three years at least. Their proceedings now became insignificant: Lubec, Hamburgh, and Bremen, continued cities of the German empire ; but in 1810 they were seized by Buonaparte to effect what he called the continental system.

On the overthrow of his power, in 1814, these towns were restored to liberty, and admitted as members of the Germanic diet; and, under the name of Hanse Towns, they maintain a kind of commercial treaty with each other, and have recently erected a court of appeal at Lubec.

IIA'NT, for has not, or have not.

That roguish leer of your's makes a preity woman's heart ake : you ha'nt that simper about the mouth for nothing. Addison.

HANTCHONG, a first rate city of China in the south of the fertile province of Chen-si but surrounded by forests. Its chief articles of trade are cinnabar, musk, wax, and honey. It stands in long. 106° 44' E., and lat. 32° 59' N.

HANTS, a county of Nova Scotia, containing the townships of Falmouth, Newport, and Windsor. It is about twenty miles square and partly unsettled, but well watered throughout.

HANWAY (Jonas), was born at Portsmouth in Hampshire, on the 12th of August 1712. His father, Mr. Thomas Hanway, was an officer in the naval service. At the age of seventeen he

to a merchant in that city in June 1729. His early life was marked with that attention to business, and love of regularity, which afterwards distinguished his character. On the expiration of his apprenticeship he entered into business at Lisbon as a merchant, but not long after returned to London. He afterwards connected himself as a partner in Mr. Dingley's house in St. Petersburgh; where he arrived on the 10th of June 1743. The trade of the English over the Caspian Sea into Persia at this period had been entrusted to the care of Mr. Elton, who had injudiciously engaged in the service of Nadir Shah, to build ships on the Caspian after the European manner. This liad alarmed the merchants in the Russian trade, who resolved to send one of their body into Persia. On this occasion Mr. Hanway offered his service, which was accepted. He set out on the 10th of September ; and after experiencing various dangers in that kingdom, during twelve months, returned to St. Petersburgh, January 1st, 1745, without being able to establish the intended trade by the Caspian; partly through the jealousy of the Russian court on account of Elton's connexions with the Persians. and partly by the Persian revolutions. He now settled at St. Petersburgh; where he remained five years, and interested himself greatly in the concerns of the merchants who had engaged in the Caspian trade: but, having a desire to see his native country, he left St. Petersburgh on the 9th of July 1750. In 1753 he published An Historical Account of the British Trade over the Caspian Sea; with a Journal of Travels from London through Russia into Persia; and back again through Russia, Germany, and Holland : to which are added, the Revolutions of Persia during the present century, with the particular Ilistory of the great Usurper Nadir Kouli: 4 vols. 4to. In 1754 he published A Letter to Mr. John Spranger, on his excellent Proposal for Paving, Cleansing, and Lighting the Streets of Westminster, &c. 8vo. A few years afterwards many of Mr. Hanway's ideas, thrown out in this pamphlet, were adopted. In 1756 he printed A Journal of Eight Days' Journey from Portsmouth to Kingston upon Thames, with an Essay on Tea; which was reprinted in 2 vols. 8vo., in 1757. At this juncture, Great Britain being on the eve of a war with France, he published Thoughts on the Duty of a good Citizen with Regard to War and Invasion, in a Letter from a Citizen to his Friend, 8vo. About the same time several gentlemen formed a plan, which was matured and perfected by Mr. Hanway, for providing the navy with sailors, by furnishing poor children with necessaries to equip them for the service of their country. Mr. Hanway published three pamphlets on this subject, and the treasurer of the society, accompanied by Mr. Hanway, having waited on the king, the society received $\pounds1000$ from his majesty, $\pounds400$ from the prince of Wales, and £200 from the princess dowager. This excellent institution was the favorite object of Mr. Hanway's care, and continued to flourish under his auspices. In 1758 he became an advocate for the Magdalen Charity, and published A Letter to Robert Dingley, esq., being a propo-

was sent to Lisbon, and was bound apprentice

sai tor the Relief and Employment of friendless Girls and repenting Prostitutes, 4to. He also printed some other tracts on the same subject RAP, n.s. & v. n. Goth. and Teut. happe In 1759 he wrote Reasons for an Augmentation of at least Twelve Thousand Mariners, to be employed in the Merchants' Service and Coasting Trade, in thirty-three Letters to Charles Gray, esq., of Colchester, 4to.

The many useful and public-spirited plans, which Mr. Hanway had promoted, had now rendered his character popular; while his disinterestedness, and the sincerity of his intentions, were conspicuous to all. Five principal citizens of London waited on lord Bute, then prime minister, and requested that some notice might be taken of a man who, at the expense of his own private fortune, and by the most unremitting application, had rendered such meritorious services to his country. Accordingly he was, in July 1762, appointed one of the commissioners for victualling the navy; a post which he held above twenty-one years. The next act of public beneficence, in which he engaged, was the collection of money for the sufferers by the fire at Montreal, in Quebec, in May, 1765, when a fourth part of the city was consumed. On this occasion Mr. Hanway, in conjunction with two other gentlemen, collected £8415. In 1766 a dreadful fire broke out in Bridge Town in Barbadoes, which consumed property to the amount of nearly £100,000. A subscription was opened, in which Mr. Hanway was a principal actor, and $\pounds 14,886$ were collected, and transmitted to the unfortunate sufferers. At subsequent periods he continued to interest himself in various other plans for relieving the distresses of different classes of the community, and particularly those of young chimney sweepers. In 1774 he enlarged a former publication, under the title of Virtue in Humble Life: containing reflections on the reciprocal duties of the Wealthy and Indigent, the Master and the Servant, 2 vols. 8vo. In 1783, finding his health decline, he resigned his office at the victualling board, and immediately received a grant of his whole salary, as a pension for life. This favor he owed to the esteem which his majesty, to whom he was per-sonally known, entertained for him. He now promoted a subscription for the relief of the many black poor who wandered about the metropolis; and the lords of the treasury seconded the design, by directing £14 a head to be issued to the committee, to enable them to send the blacks to such places abroad as might be fixed on. After encountering many obstacles, about 300 negroes were sent, properly accommodated with necessaries, to Africa. In summer 1786 Mr. Hanway's health declined visibly. He had long felt the approach of a disorder in the bladder, which, increasing by degrees, caused a stranguary; and at length, on the 5th of September 1786, put a period to a life spent almost entirely in the service of his fellow creatures. On the 13th he was interred in the family vault at Hanwell, where a superb monument is erected to his memory. Mr. Hanway is said to have been the first man in Britain who carried an umbrella.

HANYANG, a city of China, of the first

HAP, n. s. & v. n.	Goth. and Teut. happe ;
HAPHAZ'ARD, n. s.	Welsh anhap. Whatever
HAP'LY, adj.	falls out by chance whe-

Certain graces and happinesses, peculiar to every language, give life and energy to the words. Id.

Leviathan, which God of all his works Created, hugest, that swim the ocean stream, Him haply slumbering on the Norway foam, The pilot of some small night-foundered skiff Deeming some island oft, as seamen tell, Who fixed anchor in his scaly rind, Moors by his side. Milton.

Truth and peace, and love, shall ever shine About the supreme throne

Of him, to whose happy making sight alone, Our heavenly guided soul shall climb. Id.

To warn

Us, haply too secure, of our discharge

From penalty, because from death released Some days.

I have happened on some other accounts relating to mortalities. Graunt.

And when he happened to break off

I' th' middle of his speech, or cough,

H' had hard words ready to show why

And tell what rules he did it by. Hudibras. Curst be good haps, and curst be they that build Their hopes on haps, and do not make despair

For all these certain blows the surest shield. Sidney. At other end Uran did Strephon lend

Her happy making hand. Id. Preferred by conquest, happily o'erthrown,

Falling they rise to be with us made one. Waller.

Chymists have been more happy in finding experiments than the causes of them. Boyle.

If it so fall out that thou art miserable for ever, thou hast no reason to be surprised, as if some unexpected thing had happened to thee. Tillotson.

Philosophers differ coout the chief good or happiness of man. Temple.

Yet in this agony Lis fancy wrought,

And fear supply'd han with this happy thought. Dryden.

Neither is it so trivial an undertaking to make a tragedy end *happily*; for 'tis more difficult to save than kill. Id.

Here hapless Icarus had found his part,

Had not the father's grief restrained his art. Id. We live at hap-hazard, and without any insight

into causes and effects. L'Estrange. A fox had the hup to fall into the walk of a lion.

The various and contrary choices that men make in the world, argue that the same thing is not good to every man alike : this variety of pursuits shews, that every one does not place his *happiness* in the same thing. Locke.

We take our principles at *hap-hazard* upon trust, and then believe a whole system, upon a presumption that they are true. *Id.*

Happy the man who void of care and strife, In silken or in leathern purse retains

A splendid shilling. Philips's Splendid Shilling.

Did his hapless passion equal mine, I would refuse the bliss. Smith.

Then haply yet your breast remains untouched, Though that seems strange. Rowe.

VOL. XI.

Though the presence of imaginary good eannot make us happy, the absence of it may make us miserable. Addison.

Formed by thy converse, *happily* to steer From grave to gay, from lively to severe.

Pope.

Some beauties yet no precepts can declare : For there's a happiness as well as care. Id. Formed by some rule that guides but not constrains,

And finished more through *happiness* than pains. *Id.* One gentleman is *happy* at a reply, and another

excels in a rejoinder. Swift.

Let us now see what conclusions may be found for instruction of any other state, that may haply labour under the like circumstances. Id.

The voice of the Eternal said Be free, And this divine prerogative to thee

Does virtue, happiness, and heaven convey.

Beattue. Thou winged and cloud-cleaving minister, Whose happy flight is nighest unto heaven, Well may'st thou swoop so near me—I should he Thy prey, and gorge thine eaglets.

Byron. Manfred.

And of the *happiest* moments which were wrought Within the web of my existence, some

From thee, fair Venice! have their colours caught. Id. Childe Harold.

HAPAE, or HABEI, a cluster of low fertile islets among the Friendly Islands. They are four or more in number, about six or seven miles in length, and from two to three in breadth, joined together by reefs. They lie about long. 185° 36' to 185° 45' E., lat. 19° 39' to 19° 53' S.

HAPSAL, a sea-port of Russia, in Esthonia, on the coast of the Baltic, five miles south-west of Revel, opposite Dago Isle.

HAPSBURG, an ancient castle of the Helvetic republic, in the canton of Bern, seated near Schintnach, on a hill, upon the right bank of the Aar, three miles above Bruck. It was the cradle of the house of Austria, having been built by count Vernor bishop of Strasburgh, in the eleventh century, and by him given to his brother Radbad, whose son Vernor first took the title of count Hapsburg, which his descendants continued to bear till the elevation of Rodolph I. to the imperial throne. It was then given as a fief to the lords of Waldeck, but fell under the dominion of the Bernois in 1415, when they conquered Argow. It is now in ruins: five miles north of Lenzburg.

HAQUE, in old statutes, a little hand-gun, prohibited to be used for destruction of game, &c., by 33 Hen. VIII. cap. 5, and 2 and 3 Edw. VI. cap. 14. There is also the demi-haque, or half-haque, within the said acts.

HA'QUETON, n. s. Fr. haqueton. A coat of mail.

And next his shert an haketon.

Chaucer. The Rime of Sire Thopas.

HARAN, CHARRAN, OT CHARRÆ, a city of Mesopotamia, celebrated for having been the place whither Abraham retreated, after he left Ur (Gen. xi. 31, 32.); where Terah his father died, and was buriéd; whither Jacob retired, when he fied from Esau (Id. xxvii. 45, xxviii. 10, &c.); and where Crassus the Roman general was defeated and killed by the Parthians. It was situated between the Euphrates and the Chebar, at a good distance from their junction.

French, HARANGUE', n. s., v. n. & v. a. Sharangue. HARANG'UER, n. s.

The original of the French word is questioned : Menage thinks it a corruption of hearing, English; Junius imagines it to be discours au rang, to a circle, which the Ital. arringo seems to favor. Perhaps it may be from orare, or orationare, orationer, oraner, aranger, haranguer .-- Johnson. A speech; a popular oration; to make a speech; to address by an oration, as he 'harangued the troops.' Haranguer, a public speaker, generally used in a contemptuous sense.

Gray-headed men, and grave, with warriors mixed, Assemble, and harangues are heard, but soon Milton.

In factious opposition. Nothing can better improve political school-boys than the art of making plausible or implausible hurangues, against the very opinion for which they Swift. resolve to determine.

Many preachers neglect method in their harangues. Watts.

HARASS, v.a. & n.s. Fr. harasser, from harasse, a heavy buckler .- Du Cange. To weary; to fatigue; to tire with labor and uneasiness : harass, waste; a disturbance.

These troops came to the army but the day before, hurassed with a long and wearisome march. Bacon. The men of Judah, to prevent

The harass of their land, beset me round.

Milton.

34

Our walls are thinly manned, our best men slain; The rest, an heartless number, spent with watching, And harassed out with duty. Dryden.

Nature oppressed, and harassed out with care, Addison. Sinks down to rest.

HAR'BINGER, n. s.	Fr. herberge;
	Dutch, herberg,
	herberger; Ital.
	<i>albergo</i> . One
	who goes be-
HAR'BROUGH, n. s.) fore to provide

lodgings; a forerunner. Harbour, a lodging; a port; a haven for shipping; an asylum or shelter: to sojourn; to entertain; to shelter or protect. Harbourless, without shelter; wanting a harbour. The general and primary idea is a place of rest and security.

The fame anon thurgout the town is born, How Alla king shal come on pilgrimage, By herbergeours that wenten him beforn. Chaucer. The Man of Lawes Tale.

- Now Lordinges, trewely Ye ben to me welcome right hertily, For by my trouthe, if that I shal not lie, I saw not this yere swiche a compagnie At ones in this herberwe, as is now. Id. Prologue to the Canterbury Tales.

Shortly, I woll herberowe me,

There I hope best to hulstred be.

Id. Romaunt of the Rose.

Let in us, your king, whose laboured spirits, Forewearied in this action of swift speed, Crave harbourage within your city walls. Shakspeare.

Three of your argosies

Are richly come to harbour suddenly. Id.

Id. This night let's harbour here in York.

HAR

They are sent by me,

That they should harbour where their lord would be. Id.

Make all our trumpets speak, give them all breath, Those clamorous harbingers of blood and death. Id.

I'll be myself the harbinger, and make joyful The hearing of my wife with your approach. Id.

My lady bids me tell you, that though she harbours you as her uncle, she's nothing allied to your dis-Id. orders.

Knaves I know, which in this plainness Harbour more craft, and more corrupter ends,

Than twenty silky ducking observants. Id. Underneath this stone doth lie

As much beauty as could die,

Which in life did harbour give

To more virtue than doth live.

Ben Jonson.

Sin, and her shadow death, and miscry, Milton. Death's harbinger.

And now of love they treat, 'till th' evening star, Love's harbinger, appeared. Id.

Before him a great prophet, to proclaim His coming, is sent harbinger, who all

Invites.

Come fair Repentance, daughter of the skies ! Soft harbinger of soon returning virtue

The weeping messenger of grace from Heaven.

Id.

Brown's Athelstan.

Harbour yourself this night in this castle : this country is very dangerous for murthering thieves to Sidney. trust a sleeping life among them.

Southwards they bent their flight, And harboured in a hollow rock at night : Next morn they rose, and set up every sail; The wind was fair, but blew a mackrel gale. Dryden.

For harbour at a thousand doors they knocked ; Not one of all the thousand but was locked.

As Ormond's harbinger to you they run ;

For Venus is the promise of the Sun. Id. Let me be grateful; but let far from me

Be fawning cringe, and false dissembling look, And servile flattery, that harbours oft

In courts and gilded roofs.

Philips.

They leave the mouths of Po, That all the borders of the town o'erflow; And, spreading round in one continued lake, A spacious hospitable harbour make. Addison. Doubly cursed

Be all those easy fools who give it harbour. Rowe.

Let not your gentle breast harbour one thought Of outrage from the king. Id.

Dear solitary groves where peace does dwell, Sweet harbours of pure love and innocence !

Rochester's Valentinian.

We owe this old house the same kind of gratitude that we do to an old friend who harbours us in his dcclining condition, nay even in his last extremitics. Pope.

How people, so greatly warmed with a sense of liberty, should be capable of harbouring such weak superstition; and that so much bravery and so much folly can inhabit the same breasts. Id.

How guilt once harboured in the conscious breast Intimidates the brave, degrades the great.

Dr. Johnson.

HARBINGER, in the king's household, an officer who has four yeomen under him, that ride a day's journey before the court when it travels, to provide lodgings, &c.

HARBOROUGH, or MARKET HARBOROUGH, a town of Leicestershire on the road to Derby

Id.

near the source of the Welland. The road enters the town by a ford in the river, but there is a bridge of six arches, adjoining the ford, for the use of carriages when the floods render the water impassable or unsafe : at other times this bridge is only used by horse and foot passengers. It is a great thoroughfare, and was famous, in Camden's time, for its fairs, where the best horses and colts are still sold. They are held April 29th, and October 19th. It has also a considerable manufacture of tammies, lastings, &c. The market is on Tuesday. The earl of Harborough built a neat market-house at his own expense here some years ago. Here is a chapel, which is a curacy, in the patronage of Christ Church College, Oxford, and is estimated at somewhat more than £100 a-year; it is dedi-There cated to St. Dionysius, the Areopagite. are also three meeting-houses in Harborough for Independents, Quakers, and Methodists. Many Roman antiquities have been found here. On the east of the town are traces of an encampment, which is considered as Roman : and the head quarters of king Charles I.'s army seem to have been in this place previous to the memorable battle of Naseby; Cromwell's letter to the speaker of the house of commons, giving an account of the battle, is dated here. It is eightythree miles north-west of London, and fifteen south-east of Leicester.

HARBOUR ISLAND, one of the smallest of the Bahama Islands, situated to the north of Eleuthera. Here is situated the parish church belonging to Eleuthera; and it has been long settled by a race who live chiefly upon fish. Their town contains about 600 whites, and 300 blacks, and is beautifully situated on the south side of the island in front of the harbour, which can only be entered at each end by vessels of small draught.

HARBOUR ISLAND, a small island of the United States, in Pamlico Sound, near the coast of North Carolina. Long. 76° 32' W., lat. 34° 50' N.

HARBOURG, a small island in the English Channel, near the coast of France. Long. 1° 59' W., lat. 48° 39' N.

HARBURG, a town in the duchy of Lunéburg, Hanover, on the Elbe opposite to Hamburgh. It is the medium of intercourse between Hamburgh and the west country. An important article of traffic is bilberries, which are shipped here annually to the value of between £3000 and £4000 sterling, chiefly to Bourdeaux, to color the wines. Population 3650. Seven color the wines. Population 3650. Seven miles south of Hamburgh, and twenty-two north-west of Lunéberg. Long. 9° 56' E., lat. 53° 28' N.

HARD, adj. Sax. beapo; Dut. hard; Teut. hard. Firm; resisting penetration or separation; not soft; not easy to be pierced or broken.

Repose you there, while I to the hard house, More hard than is the stone whereof 'tis raised ; Which even but now, demanding after you, Denied me to come in. Shakspeare.

Difficult; not easy to the intellect.

The hard causes they brought unto Moses; but every small matter they judged themselves. Exodus.

When hard words, jealousies, and fears, Set folks together by the ears. Hudibras. Some diseases, when they are easy to be cured, are hard to be known. Sidney.

Tis hard to say, if Clymene were moved More by his prayer, whom she so dearly loved, Or more with fury fired. Dryden.

As for the hard words which I was obliged to use, they are either terms of art, or such as I substituted in place of others that were too low. Arbuthnot.

Difficult of accomplishment; full of difficulties.

Is any thing too hard for the Lord? Genesis.

He now discerned he was wholly to be on the defensive, and that was like to be a very hard part too. Clarendon.

Possess

As lords a spacious world, to our native heaven

Little inferior, by my adventure hard

With peril great achieved. Milton.

Long is the way

And hard, that out of hell leads up to light ; Our prison strong. Id.

The love and pious duty which you pay Have passed the perils of so hard a way.

Dryden.

Nervous and tendinous parts have worse symptoms, and are harder of cure, than fleshy ones. Wiseman.

Painful; distressful: laborious action or suffering.

Rachael travailed, and she had hard labour.

Genesis.

Worcester's horse came but to-day ;

And now their pride and mettle is asleep,

Their courage with hard labour tame and dull,

That not a horse is half of himself. Shakspeare.

Continual hard duty, with little fighting, lessened Clarendon. and diminished his army.

When Sehastian weeps, his tears

Come harder than his blood. Dryden.

A man obliged to hard labour is not reduced to the necessity of having twice as much victuals as one under no necessity to work. Cheyne.

Cruel; oppressive; rigorous: as, a hard heart.

The bargain of Julius III. may he accounted a very hard one. Browne's Vulgar Errours.

Whom scarce my sheep, and scarce my painful plough,

The needful aids of human life allow; So wretched is thy son, so hard a mother thou.

Dryden.

If you thought that hard upon you, we would not refuse you half your time. Id.

Live thou to mourn the love's unhappy fate,

To bear my mangled body from the foe,

Or buy it back, and funeral rites bestow ;

Or if hard fortune shall those dues deny, Thou canst at least an empty tomb supply.

Id.

A loss of one-third of their estates will be a very hard case upon a great number of people. Locke.

No people live with more ease and prosperity than the subjects of little commonwealths; as, on the contrary, there are none who suffer more under the grievances of a hard government than the subjects of Addison. little principalities.

To find a bill that may bring punishment upon the innocent, will appear very hard. Swift.

Sour; rough; severe.

What, have you given him any hard words of late ? Shakspeare.

Rough ungovernable passions hurry men on to say or do very hard or offensive things. Atterbury.

Unfavorable; unkind.

As thou lovest me, do him not that wrong,

To bear a hard opinion of his truth. Shakspeare. Absalom and Achitophel he thinks is a little hard

on his fanatick patrons. Dryden. Some hard runours have been transmitted from t'other side the water, and rumours of the severest kind. Swift.

Insensible; inflexible.

If I by chance succeed

In what I write, and that's a chance indeed,

Know I am not so stupid or so hard,

Not to feel praise, or fame's deserved reward.

Dryden.

36

Unhappy; vexatious.

It is a very hard quality upon our soil or climate, that so excellent a fruit, which prospers among all our neighbours, will not grow here. Temple.

Vehement; keen; severe: as, a hard winter; hard weather.

Full hard it is with flesh-hook, or with oules

To ben yclawed. Chaucer. The Sompnoures Tale.

Unreasonable; unjust.

It is a little *hard*, that, in an affair of the last consequence to the very being of the elergy, this whole reverend body should be the sole persons not consulted. Swift.

It is the *hardest* case in the world, that Steele should take up the reports of his faction, and put them off as additional fears. *Id.*

Forced; not easily granted.

If we allow the first couple, at the end of one hundred years, to have left ten pair of breeders, which is no hard supposition; there would arise from these, in fifteen hundred years, a greater number than the earth was capable cf. Burnet.

Powerful; forcible.

The stag was too hard for the horse, and the horse flies for succour to the man that's too hard for him, and rides the one to death, and outright kills the other. L^{2} Estrange.

Let them consider the vexation they are treasuring up for themselves, by struggling with a power which will be always too hard for them. Addison.

A disputant, when he finds that his adversary is too hard for him, with slyness turns the discourse.

Watts.

Shall our pale withered hands, be still stretched out,

Trembling, at once, with cagerness and age ?

With av'rice and convulsions grasping hard ?

Grasping at air, for what has earth beside ?

Young's Night Thoughts.

Austere; rough, as liquids.

In making of vinegar, set vessels of wine over against the noon sun, which calleth out the more oily spirits, and leaveth the spirit more sour and hard. Bacon.

Harsh; stiff; constrained.

Get thee glass eyes;

And like a scurvy politician seem To see the things thou dost not—how, now, now, now:

Pull off my boots :- harder, harder; so.

Shakspeare. King Lear. Others, scrupulously tied to the practice of the ancients, make their figures harder than even the marble itself. Dryden.

His direction is *hard*, his figures too bold, and his tropes, particularly his metaphors, insufferably strained.

Not plentiful; not prosperous

There are bonfires decreed; and, if the times had not been hard, my billet should have burnt too.

Dryden. Avaricious ; faultily sparing.

These thanks I pray you: And know that when Sebastian weeps, his tears Come harder than his blood. Dryden.

HARD, adv. Hardo, very old German.

Close; near; often with by.

Abimelech went hard unto the door of the tower, to burn it with fire. Judges.

The Philistines followed hard upon Saul. 2 Samuel.

A little lowly hermitage it was,

Down in a dale hard by a forest's side,

Far from resort of people that did pass

In travel to and fro. Spenser.

Scarce had he said, when hard at hand they spie That quicksand nigh, with water covered. Id.

Hard by was a house of pleasure, built for a summer retiring place. Sidney.

They doubted a while what it should be, 'till it was cast up even hard before them; at which time they

fully saw it was a man. Id.

When these marshal the way, hard at hand comes the master and main exercise. Shakspeare.

Hard by a cottage chimney smokes, From betwixt two aged oaks. Milton.

Diligently; laboriously; incessantly; vehemently; earnestly; importunately.

Geneura rose in his defence,

And prayed so hard for mercy from the prince,

That to his queen the king the offender gave.

Dryden.

An ant works as *hard* as a man who should carry a heavy load every day four leagues. Addison.

Whoever my unknown correspondent be, he presses hard for an answer, and is earnest in that point. Atterbury.

Uneasily; vexatiously.

When a man's servant shall play the cur with him, look you it goes hard. Shakspeare.

Distressfully; so as to raise difficulties.

The question is hard set, and we have reason to doubt. Browne.

A stag that was hard set by the huntsmen, betook himself to a stall for sanctuary. L'Estrange.

Fast; nimbly; vehemently.

The wolves scampered away as hard as they could drive. L'Estrange.

With difficulty; in a manner requiring labor. Solid bodies foreshow rain, as boxes and pegs of wood when they draw and wind hard. Bacon.

Tempestuously; boisterously.

When the north wind blows hard, and it rains sadly, none but fools sit down in it and cry; wise people defend themselves against it. Taylor.

¹ HARDANGERFIORD, an extensive arm of the sea, which runs inland on the west coast of Norway, about ninety-eight miles in a north-east direction. It is between 59° 28' and 60° 25' of N. lat.

HA'RDBOUND, adj. Hard and bound. Costive.

Just writes to make his barrenness appear,

And strains from hardbound brains eight lines a year. Pope.

HAR'DEN, v. n. & v. a. From hard. To HAR'DENER, n. s. grow hard; to make hard; to confirm in wickedness; to stupify; to make firm or constant. 37

He stiffened his neck, and hardened his heart from turning unto the Lord. 2 Chronicles.

Then should I have comfort? yea, I would harden myself in sorrow. Job.

But exhort one another daily, lest any of you he hardened through the deceitfulness of sin. Hebrews.

They speken of sondy harding of metall

And speken of medecines therwithall,

And how and when it should yharded be,

Which is unknown algates unto me.

Chaucer. The Squires Tale. The powder of loadstone and flint, by the addition of whites of eggs and gum-dragon, made into paste, will in a few days harden to the hardness of a stone. Bacon.

Even Lust, the master of a hardened face, Blushes if thou be'st in the place; To Darkness' curtains he retires;

In sympathising Night he rolls his smoky fires. Cowley.

Avoid the politic, the factious fool, The busy buzzing, talking hardened knave. Otway.

He that hardeneth his heart, and sets God and his judgments at defiance, and receives not the impressions of his word or rod, shall fall into mischief; his presumption will be his ruin, and whatever sin he falls into, it is owing to the hardness of his heart. Henry. Prov. xxviii. 14.

Sure he, who first the passage tried,

In hardened oak his heart did hide,

And ribs of iron armed his side. Dryden.

One raises the soul, and hardens it to virtue; the other softens it again, and bends it into vice. Id.

It is a melancholy consideration, that there should be several among us so *hardened* and deluded as to think an oath a proper subject for a jest. Addison.

Years have not yet hardened me, and I have an addition of weight on my spirits since we lost him. Swift to Pope.

HABDEN, a county of Kentucky, on the Ohio; distant from Washington 662 miles. Population 7581. The chief town is Elizabeth Town.

HARDENING, the giving a greater degree of hardness to bodies than they had before. There are several ways of hardening iron and steel, as by hammering them, quenching them in cold water, &c. See CASE-HARDENING and STEEL.

HARDERWICK, or HARDERWYCK, a town of the Netherlands, in Dutch Guelderland, on the Zuyder Zee. It was only a village till 1229, when Otho surrounded it with walls. It was afterwards one of the Hanse Towns : in 1503 it was mostly burnt down, but was soon after rebuilt with seven gates. In 1511 it was taken by Charles duke of Guelders; in 1552 by the troops of Charles V.; and in 1572 by the confederates. It has a university founded in 1618, converted in 1808 into an Athenæum or academy with eight professors : and the church of St. Martin is much admired. The trade is in corn, timber, and herrings. It is nineteen miles west of Deventer, twenty-five north-east of Utrecht, and forty east of Amsterdam.

HAR

HARD'FAVORED, adj. HARD'HANDED, adj. HARD'HEAD, n. s. HARD'HEARTED, adj. HARD'HEARTEDNESS, n. s. HARD'HEARTEDNESS, n. s. HARD'HEAD, n. s. HARD'INEON, n. s. HARD'INEOS, n. s. HARD'LABORED, adj. HARD'SHIP, n. s. HARD'SHIP, n. s. HARD'WAREMAN, n. s. HARD'Y, adj.

Compounds of hard : the primary meaning is applied to whatever makes resistance to external impressions.— Their meanings are mostly obvious. Hard-favored is coarse or harsh of countenance ; hard-head the manner of fighting, in which the combatants dash heads to-

gether. Hardihood, hardiment, courage; bravery. Hardiness, hardship and fatigue; courage. Hard-labored, diligently wrought. Hardship, injury; oppression. Hardware, manufacture of metal. Hardy, bold; strong; confident, in a good and bad sense.

And to the tre she goeth, a ful gode pace, For love made her so *hardy* in this case. *Chaucer. Legende of Good Women.*

Then sawe I beautie with a nice atire, And youth, all full of game and jolitee; Fole hardinesse, flatterie, and desire, Messagerie, and Mede, and other thre, Hir names shall not here be tolde for me. Id. The Assemble of Foules.

The which his mother seeing, gan to feare Least his too haughty hardiness might reare Some hard mishap in hazard of his life.

Spenser. Faerie Queene.

That stroke the hardy squire did sore displease. Id. But full of fire and greedy hardiment,

The youthful knight could not for ought be staid. Spenser.

Enflamed with fury and fierce hardyhead, He seemed in heart to harbour thoughts unkind, And nourish bloody vengeance in his bitter mind.

They are valiant and hardy; great endurers of cold, hunger, and all hardiness. Id.

On the gentle Severn's sedgy bank, In single opposition, hand to hand, He did confound the best part of an hour,

In changing hardiment with great Glendower. Shakspeare.

If we, with thrice such powers left at home, Cannot defend our own doors from the dog, Let us be worried; and our nation lose The name of *hardiness* and policy. Id.

When the blast of war blows in your ears, Stiffen the sinews, summon up the blood, Disguise fair Nature with *hardfavoured* looks, Then lend the eye a terrible aspect. Id.

Hardhearted Clifford, take me from the world; My soul to heaven. Id.

Hardhanded men that work in Athens here, Which never laboured in their minds 'till now.

Perkin had gathered together a power of all nations, neither in number, nor in the hardiness and courage of their persons contemptible. Bacon.

Try the imagination of some in cock-fights, to make one cock more *hardy*, and the other more cowardly.

Zeal was the spring whence flowed her hardiment. Fairfar. Boldly assault the necromancer's hall, Where if he be, with dauutless hardihood.

Milton.

Id.

When Vulcan came into the world, he was so hardfavoured that both his parents frowned on him.

Dryden.

'Tis time my hardmouthed coursers to controul, Apt to run riot, and transgress the goal. Id.

But who can youth, let loose to vice, restrain? When once the hardmouthed horse has got the rein, He's past thy power to stop. Id.

I have been at hardhead with your butting citizens; I have routed your herd, I have dispersed them.

Recite

The feats of Amazons, the fatal fight

Betwixt the hardy queen and hero knight. Id. Can you be so hardhearted to destroy

My ripening hopes, that are so near to joy ? Id. Hardheartedness and cruelty is not only an inhuman

vice, but worse than brutal. The brother a very lovely youth, and the sister

hardfavoured. Id. He has the courage of a rational creature, and such an hardiness we should endeavour by custom and use to bring children to. Locke.

to bring children to. Locke. Who is there hardy enough to contend with the reproach which is prepared for those, who dare venture to dissent from the received opinions of their country?

Id.

You could not undergo the toils of war,

Nor bear the hardships that your leaders bore.

Addison.

Criminal as you are, you avenge yourself against the hardiness of one that should tell you of it.

Addison.

Swift.

Is a man confident of his present strength? An unwholesome blast may shake in pieces his hardy fabrick. South.

How black and base a vice ingratitude is, may be seen in those vices which it is always in combination with, pride and hardhcartedness, or want of compassion. Id.

In journeys or at home, in war or peace,

By hardships many, many fall by ease. Prior.

Could thirst of vengeance, and desire of fame, Excite the female breast with martial fame? And shall not love's diviner power inspire More hardy virtue, and more generous fire? Id.

John Bull, otherwise a good-natured man, was very hardhearted to his sister Peg. Arbuthnot.

How cheerfully the hawkers cry

A satire, and the gentry buy !

While my hardlaboured poem pines,

Unsold upon the printer's lines.

They are ripe for a peace, to eujoy what we have conquered for them; and so are we, to recover the effects of their hardships upon us. Id.

Hardheartedness is an essential in the character of a libertine. Clarissa.

HARDINGE (Nicholas), an English lawyer, chiefly distinguished for the cultivation of the belles lettres. He studied at Eton and Cambridge ; after which he kept terms at the Middle Temple and was called to the bar. In 1731 he obtained the office of clerk to the house of commons; in 1752 he was made joint secretary of the treasury ; and was twice elected M. P. for the borough of Eye. He died aged fifty-seven in 1758. His works consist of some English poetry, and a volume of Latin poems.

HARDINGE (George), son of the preceding, born in 1744. After finishing his studies at

Eton, he went to Trinity College, Cambridge ; where his tutor was Dr. Watson, afterwards bishop of Llandaff. In 1769 he was created, by mandate, master of arts; and called to the bar the same year. The interest of his mother's brother, lord Camden, procured him the rank of serjeantat-law; and he was subsequently appointed solicitor-general to her majesty. In 1787 he was made a Welsh judge, and in 1789 the queen's attorney-general. He died in the execution of his judicial duties, at Presteign, in Radnorshire, April 26th, 1816. He was a man of wit and humor, as well as great good sense and knowledge of the world. His speeches in parliament and in the courts have been published; as well as several contributions to miscellaneous literature, including three sermons. These have been also collected and printed, with his letters, and an account of his life by Mr. John Nichols.

HARDING (Thomas), D. D., was born in Devonshire in 1512. He was educated at Winchester; chosen fellow of New College, Oxford, in 1556; and appointed professor of Hebrew by king Henry VIH., whose half-reforming principles he adopted. On the accession of Edward VI. he became a complete protestant; but, on that of the Bloody Mary, he saw his error, recanted, and became a confirmed Papist; whereupon he was made prebendary of Winchester, and treasurer of the cathedral of Salisbury. Being deprived of his preferments, on the accession of queen Elizabeth, he went to Louvaine, where he began his famous controversy with bishop Jewel, against whom he wrote seven tracts in favor of Popery, between 1555 and 1567. He died in 1570. His works show him to have been a man of learning and abilities.

HARDION (James), an ingenious French author, and member of the Academy of Inscriptions, born at Tours, in 1686. He published a Universal History in 18 vols., and a Treatise on French Poetry and Rhetoric. He died in 1766.

HARDLY, adv. From hard.

With difficulty; not easily.

Tonching things which generally are received, al though in themselves they be most certain, yet, because men presume them granted of all, we are hardliest able to bring such proof of their certainty as may satisfy gainsayers, when suddenly and besides expectation they require the same at our hands.

Hooker.

There are but a few, and they endued with great ripeness of wit and judgment, free from all such affairs as might trouble their meditations, instructed in the sharpest and subtlest points of learning; who have, and that very hardly, been able to find out but only the immortality of the soul. Id.

God hath delivered a law as sharp as the two-edged sword, piercing the very closest and most unsearchable corners of the heart, which the law of nature can hardly, human laws by no means, possibly reacture. Id.

There are in living creatures parts that nourish and repair easily, and parts that nourish and repair hardly. Bacon.

The barks of those trees are more close and soft than those of oaks and ashes, whereby the moss can the hardlier issue out. Id.

-38

The father, mother, daughter they invite; Hardly the dame was drawn to this repast.

Dryden.

Recovering hardly what he lost before,

His right endears it much, his purchase more. Id. False confidence is easily taken up, and hardly laid down. South.

Scarcely; scantily; not lightly; with no likelihood.

The fish that once was caught, new bait will hardly bite. Faerie Queene.

They are worn, lord consul, so

That we shall hardly in our ages see

Their banners wave again. Shakspeare. Hardly shall you find any one so bad, but he desires the credit of being thought good. South.

Almost not; barely.

The wandering breath was on the wing to part, Weak was the pulse, and hardly heaved the heart.

Dryden.

There is hardly a gentleman in the nation who hath not a near alliance with some of that body. Swift.

Grudgingly; as an injury.

If I unwittingly

Have aught committed that is hardly borne

By any in this presence, I desire

To reconcile me. S Severely; unfavourably.

Shakspeare.

If there are some reasons inducing you to think hurdly of our laws, are those reasons demonstrative, are they necessary, or mere possibilities only? Hooker.

Rigorously; oppressively.

Many men believed that he was hardly dealt with. Clarendon.

They are now in prison, and treated hardly enough; for there are fifteen dead within two years. Addison.

They have begun to say, and to fetch instances where he has in many things been *hardly* used.

Unwelcomely; harshly.

Swift.

Such information comes very hardly and harshly to a grown man; and, however softened, goes but ill down. Locke.

Not softly; not tenderly; not delicately.

Heaven was her canopy; bare carth her bed; So hardly lodged. Dryden.

HA'RDNESS, n. s. From hard.

Durity; power of resistance in bodies.

Hardiness is a firm cohesion of the parts of matter that makes up masses of a sensible bulk, so that the whole does not easily change its figure. Locke.

From the various combinations of these corpuscles happen all the varieties of the bodies formed out of them in colour, taste, smell, hardness, and specifick gravity. Woodward.

Difficulty to be understood.

This label on my bosom

Is so from sense in hardness, that I can

Make no collection of it. Shakspeare. Difficulty to be accomplished.

It was time now or never to sharpen my intention to pierce through the *hardness* of this enterprize.

Sidney.

Concerning the duty itself, the hardness thereof is not such as needeth much art. Hooker. Scarcity; penury.

The tenants poor, the hardness of the times,

Are all excuses for a servant's crimes. Swift.

Obduracy; profligateness.

Every commission of sin introduces unto the soul a certain degree of hardness, and an aptness to continue in that sin. South. Coarseness; harshness of look.

By their virtuous behaviour they compensate the hardness of their favour, and by the pulchritude of their souls make up what is wanting in the beauty of their bodies. Ray.

Keenness; vehemence of weather or seasons. If the *hardness* of the winter should spoil them, neither the loss of seed nor labour will be much.

Mortimer.

Cruelty of temper; savageness; harshness; barbarity.

We will ask,

That if we fail in our request, the blame

May hang upon our hardness. Shakspeare. They quicken sloth, perplexities unty,

Make roughness smooth, and hardness mollify.

Denham.

Stiffness; harshness.

Sculptors are obliged to follow the manners of the painters, and to make many ample folds, which are insufferable hardnesses, and more like a rock than a natural garment. Dryden.

Faulty parsimony ; stinginess.

HARDNESS, in bodies, is a property directly opposite to fluidity, by which they resist the impression of any other substance, sometimes in an extreme degree. As fluidity has been found to consist in the motion of the particles of a body upon one another, in consequence of a certain action of the universal fluid, or elementary fire, among them; we must conclude that hardness consists in the absence of this action, or a deficiency of what is called latent heat. This is confirmed by observing, that there is an intermediate state betwixt hardness and fluidity, in which bodies will yield to a certain force, though they still make a considerable resistance. This is principally observed in the metals, and is the foundation of their duetility. It appears, indeed, that this last property, as well as fluidity, is entirely dependent on a certain quantity of latent heat absorbed, or otherwise acting within the substance itself; for all the metals are rendered hard by hammering, and soft by being put again into the fire and kept there for some time. The former operation renders them hot as well as hard; probably, as Dr. Black observes, because the particles of metal are thus forced nearer one another, and those of fire squeezed out from among them. By keeping them for some time in the fire, that element insinuates itself again among the particles, and arranges them in the same manner as before, so that the ductility returns. By a second hammering this property is again destroyed, returning on a repetition of the heating, or annealing, as it is called; and so on, as often as we please. Hardness appears to diminish the cohesion of bodies in some degree, though their fragility does by no means keep pace with their hardness. Thus, glass is very hard and very brittle; but flint, though still harder than glass, is much less brittle. Among the metals, however, these two properties seem to be more connected, though even here the connexion is hy no means complete. Steel, the hardest of all the metals, is indeed the most brittle; but lead, the softest, is not the most ductile. Neither is hardness connected with the specific gravity of bodies; for a diamond, the hardest substance in nature, is little more than

half the weight of the lightest metal. As little is it connected with the coldness, electrical properties, or any other quality with which we are acquainted; so that, though the principle above laid down may be accepted as a general foundation for our enquiries, a great number of particulars remain yet to be discovered before we can offer any satisfactory explanation. All bodies become harder by cold; but this is not the only means of their doing so, for some become hard by heat as well as cold.

Mr. Quist and others have constructed tables The of the hardness of different substances. method pursued in constructing these tables was, by observing the order in which they were able to cut or make any impression upon one another. The following table, extracted from M. Magellan's edition of Cronstedt's Mineralogy, was taken from Dr. Quist, Sir T. Bergman, and Mr. Kirwan. The first column shows the hardness, and the second the specific gravity.

Diamond from Ormus		20 - 3.7
Pink diamond		19 - 3.4
Bluish diamond		19 - 3.3
Yellowish diamond .		19 - 3.3
Cubic diamond		18 - 3.2

HA'RDOCK, n. s. I suppose the same with burdock.

Why he was met even now,

Crowned with rank fumiter and furrow-weeds, With hardocks, hemlock, nettles, cuckoo-flowers. Shakspeare.

HARDOUIN (John), a learned French Jesuit in the eighteenth century, remarkable for the paradoxes he advanced in his writings; in particular, That all the works of the ancient profane writers, except Cicero's works, Virgil's Georgics, Horace's Satires and Epistles, and Pliny's Natural History, are more forgeries. He died at

Paris in 1729, aged eighty-three. His principa. works are, 1. An edition of Pliny's Natural History, with notes, which is much esteemed; 2. An edition of the Councils, which made much noise; 3. Chronology Restored by Medals, 4to.; 4. A Commentary on the New Testament, folio; in which he pretends that our Saviour and his apostles preached in Latin, &c. HARDS, n. s. The refuse or coarser part of

flax.

HARDT (Herman von Der), a philological writer of Germany, was born in 1660 at Melle, Westphalia, where his father was director of the mint. He studied at Jena and Leipsic, and attached himself chiefly to oriental languages. The duke of Brunswick made him his librarian; and, in 1690, he was chosen professor of the Oriental languages in the university of Helmstadt; to which he induced the duke to present his library. In 1709, becoming rector of the gymnasium of Marienburg, he employed every moment he could spare in preparing for the press those works which have established his fame. Among these are, Autographia Lutheri aliorumque celebrium virorum ab anno 1517, ad ann. 1546, Reformationis Ætatem et Historiam egregiè Illustrantia, 3 vols. 8vo.; Magnum Concilium Constantiense de universali Ecclesiæ Reformatione, unione, et fide, 1697, 3 vols. folio, 1700-1742, 6 vols. folio, undertaken by order of the duke of Brunswick; Memorabilia Bibliothecæ novæ Rodolphiæ; Historia Litteraria Reformationis, 1717, 5 vols. folio; Tomus Primus in Jobum, Historiam populi Israelis in Assyriaco exilio, Samariâ Eversâ et Regno extincto Illustrans, Helmstadt, 1728, folio; the remainder of this work was never published. He died in 1746, leaving in MS. a History of the Reformation.

HARDUNHULLY, a town of the Mysore, south of India. It was taken by the rajah from a neighbouring petty prince, in the year 1614. Long. 77° 2' E., lat. 11° 50' N.

HARDY, a county of the north part of Virginia, bounded north-east by Hampshire county, east by Shenandoah county, south-west by Pendleton and Randolph counties, and north-west by Maryland. Population 5525. Chief town, Moore-fields.

HARE and HERE, differing in pronunciation only, signify both an army and a lord. So Harold is a general of an army; Hareman, a chief man in the army; Herwin, a victorious army; which are much like Stratocles, Polemarchus, and Hagesistratus, among the Greeks.

HARE, n. s. & v. n. HARE'BELL, n. s. HARE'LIP, n.s. HARE'SEAR, n. s. HAR'IER, n.s.

Saxon, papa; Erse. karh; Dan. and Swed. HARE'BRAINED, adj. | hare, from ear, or hear, HARE'FOOT, n.s. > Mr. Thomson suggests. A small quadruped, with long ears and short J tail, that moves by leaps,

remarkable for timidity, vigilance, and fecundity; the common game of hunters; also a constellation. The verb signifies to frighten or hurry with terror. Harebell, a blue flower. Harebrained, volatile; unsettled; wild. Harefoot, a bird; an herb. Harelip, a deficiency in the upper lip, constituting a disease, so called from

its resemblance to the lip of the hare. Haresear, a plant. Harier, a dog for hunting hares.

Thou shalt not lack

The flower that's like thy face, pale primrose; nor The azured harebell, like thy veins.

Shakspeare. Cymbeline.

Dismayed not this

Our captains Macbeth and Banquo?

- As sparrows, eagles; or the hare, the lion.

Shukspeare.

The blots of nature's hand

Shall not in their issue stand;

Never mole, harelip, nor fear,

Shall upon their children be. Id. That hairbrained wild fellow begins to play the fool, when others are weary of it. Bacon.

The hare appears, whom active rays supply

A nimble force, and hardly wings deny.

Creech.

We view in the open champaign a brace of swift greyhounds, coursing a good stout and well-breathed hare. More.

To hare and rate them, is not to teach but vex them. Locke.

Hills, dales, and forests far behind remain,

While the warm scent draws on the deep-mouthed train.

Where shall the trembling *hare* a shelter find ? Hark! death advances in each gust of wind.

Gay's Rural Sports.

The third stitch is performed with pins or needles, as in harelips. Wiseman.

Poor is the triumph o'er the timid hare. Thomson.

Just then a Council of the hares Had met on national affairs.

Beattie.

HARE, in zoology. See LEPUS. The hare is a beast of venery, but peculiarly so termed in its second year. There are reckoned four sorts of them, from the places of their abode : viz. the mountain, the field, the marsh, and the wandering hares. The mountain hares are the swiftest; the field hares are not so nimble; those of the marshes are the slowest: but the wandering hares are the most dangerous to follow; for they are cunning in the ways and mazes of the fields, and, knowing the nearest ways, run up the hills and rocks, to the confusion of the dogs, and the discouragement of the hunters. Hares and rabbits are very mischievous to nurseries and new planted orchards, by peeling off the barks of the young trees: to prevent which, some bind ropes about the trees up to such a height as they are able to reach; some daub them with tar; but, though this keeps off the hares, it is itself mischievous to the trees; but this hurtful property of it is in some degree taken off by mixing any kind of fat or grease with it, and incorporating them well over the fire. This mixture is to be rubbed over the lower part of the trees in November, and will preserve them till that time next year, without any danger from these animals. It is only in winter, when other fcod is scarce, that these creatures feed on the barks of trees. Those who have the care of warrens have an odd way of fattening hares, viz. stopping up their ears with wax, and render-ing them deaf. The hare is so timorous, that she continually listens after every noise, and will run a long way on the least suspicion of danger; so that she always eats in terror, and runs herself out of flesh continually. These are both prevented by her feeding in a safe place, without apprehension.

HAR

HARE, JAVA. See CAVIA.

HARE, PATAGONIAN. See CAVIA.

HARE (Dr. Francis), an English bishop, educated at Eton, and a member of King's College, Cambridge; where he had the tuition of the marquis of Blandford, only son of the illustrious duke of Marlborough, who appointed him chaplain-general to the army. He afterwards obtained the deanery of Worcester, and thence was promoted to the bishopric of Chichester, which he held with the deanery of St. Paul's to his death, in 1740. He was dismissed from being chaplain to George I. in 1718, from party prejudices. About the end of queen Anne's reign he published a rémarkable pamphlet, entitled The Difficulties and Discouragements which attend the study of the Scriptures in the Way of Private Judgment. He published many pieces against bishop Hoadly, in the Bangorian Controversy; and other learned works, which were collected after his death, and published in 4 vols., 8vo. 2. An edition of Terence, with Notes, in 4to. 3. The Book of Psalms in the Hebrew, put into the Original Poetical Metre, 4to. In this last work he pretends to have discovered the Hebrew metre, which was supposed to be irretrievably lost. But his hypothesis, though defended by some, has been confuted by Dr. Lowth in his Metricæ Hareanæ Brevis Confutatio, annexed to his lectures De Saera Poesi Hebræorum.

HARE ISLAND, a low island of Lower Canada, in the middle of the channel of the St. Lawrence, nearly eight miles in length, by the average breadth of about half a mile. It extends in a direction nearly paralle to the shores of the river. The soil is good, but uncultivated; and at each extremity are long and dangerous flats. It is 103 miles below Quebec.

HARFLEUR, a town of Normandy, in the department of the Lower Seine, on the Lezarda. It has some inferior manufactures, and was anciently a place of importance; but its harbour is now filled up. Harfleur was taken by the English in 1415 and 1440. Population 800 It is five miles east of Havre, and forty-nine west of Rouen.

. HARFORD, a county of Maryland, United States, bounded north by York county in Pennsylvania, and east by Susquehannah River and Chesapeake Bay. It is watered by Bush River and Deer Creek. Harford is the chief town. Population 21,258.

HARIDI, a serpent formerly worshipped at Achmim in Upper Egypt. 'Upwards of a century ago,' says Mr. Savary, 'a religious Turk called Scheilk Haridi died here. He passed for a saint among the Mahommedans; who raised a monument to him, covered with a cupola, at the foot of the mountain. The people flocked from all parts to offer up their prayers to him. One of their priests, profiting by their credulity, persuaded them that God had made the soul of Scheilk Haridi pass into the body of a serpent. Many of these are found in the Thebais, which are harmless; and he had taught one to obey

his voice. He appeared with his serpent, dazzled the vulgar by his surprising tricks, and pretended to cure all disorders. Some lucky instances of success, due to nature alone, and sometimes to the imagination of the patients, gave him great celebrity. He soon confined his serpent Haridi to the tomb, producing him only to oblige princes and persons capable of giving him a handsome recompense. The successors of this priest, brought up in the same principles, found no difficulty in giving sanction to so profitable a fraud. They added to the general persuasion of his virtue that of his immortality. They had the boldness even to make a public proof of it. The serpent was cut in pieces in presence of the emir, and placed for two hours under a vase. At the instant of lifting up the vase, the priests, no doubt, had the address to substitute one exactly resembling it. A miracle was proclaimed, and the immortal Haridi acquired a fresh degree of consideration. This knavery procures them great advantages. The people flock from all quarters to pray at this tomb; and if the serpent crawls out from under the stone, and approaches the suppliant, it is a sign that his malady will be cured. No human reasoning would persuade these ignorant and credulous Egyptians that they are the dupes of a few impostors: they believe in

the serpent Haridi as firmly as in the prophet.' HARJEDELAN, a province of Sweden in Nordland, about 100 miles long, and from forty to fifty broad; abounding in pastures, cattle, woods, mines, lakes, rivers, and fish.

HARIERS, or HARRIERS, are endowed with an admirable gift of smelling, and are very bold in the pursuit of game. See CANIS and Dog.

HARIORPOOR, or Udiarpur, a town belonging to independent zemindars, in the province of Orissa, fifty miles south-west from Midnapoor. It is in lat. 21° 52' N., long. 86° 52' E.

HARIOT, or HERIOT, in law, a due belonging to a lord at the death of his tenant, consisting of the best beast, either horse, or cow, or ox, which he had at the time of his death; and in some manors the best goods, piece of plate, &c., are called hariots.

HARISCHON (Aaron), a learned rabbi, and karaite, in the fifteenth century; who wrote a Hebrew grammar, printed at Constantinople, in 1581: probably the same with Aaron, the Caraite, a Jewish physician at Constantinople, who, about 1294, wrote a commentary on the Pentateuch, printed at Jena, in folio in 1710, and of which there is an original MS. copy in the National Library at Paris.

HARK, *interj. & v. n.* Originally the imperative of the verb hark, which signifies to listen, and is a contraction of hearken.

What harmony is this? My good friends, hark! Shakspeare.

> Pricking up his ears, to hark If he could hear too in the dark.

Hudibras.

The butcher saw him upon the gallop with a piece of flesh, and called out, *Hark* ye, friend, you may make the best of your purchase. L'Estrange.

Hark! methinks the roar that late pursued me, Sinks like the murmurs of a falling wind. Rowe. Not closest coverts can protect the game : Hark! the dog opens; take thy certain aim. Gay's Rural Sports.

Hark how loud the woods

Invite you forth ! Thomson.

The cottage curs at carly pilgrim bark; Crowned with her pail the tripping milk-maid sings, The whistling ploughman stalks afield, and hark! Down the rough slope the ponderous waggon rings. Beautie

Hark! forth from the abyss a voice proceeds, A long low distant murmur of dread sound,

Such as arises when a nation bleeds With some deep and immedicable wound.

Byron. Childe Harold.

HARL, n. s. The filaments of flax; any filamentous substance.

The general sort are wicker-hives, made of privet, willow, or *harl*, daubed with cow-dung. Mortimer.

HARLE, the bark of flax, which, when separated from the useless woody part, called the boon, by proper dressing, becomes itself the useful commodity well known by the name of flax.

HARLEIAN COLLECTION, a most valuable collection of useful and curious MSS. begun near the end of the last century, by R. Harley of Brampton Bryan, esq., afterwards earl of Oxford, and conducted upon the plan of the great Sir Robert Cotton. In August, 1705, he published his first considerable collection; and in less than ten years he had collected together nearly 2500 rare and curious MSS. Soon after this the celebrated Dr. George Hicks, Mr. Anstis, garter king at arms, bishop Nicholson, and many other eminent antiquaries, not only offered him their assistance in procuring MSS, but presented him with several that were very valuable. Being thus encouraged to perseverance by his success, he kept many persons employed in purchasing MSS. for him abroad, giving them written instructions for their conduct. By these means the MS. library was, in 1721, increased to nearly 6000 books, 14,000 original charters, and 500 rolls. His son Edward, earl of Oxford, still farther enlarged the collection; so that when he died, June 16th, 1741, it consisted of 8000 vols. several of them containing distinct and independent treatises, besides many loose papers, which have been since sorted and bound up in volumes; and above 40,000 original rolls, charters, letters patent, grants, and other deeds and instruments of great antiquity. The principal design of making this collection was the establishment of a MS. English historical library, and the rescuing from destruction such national records as had eluded the diligence of preceding collectors: but lord Oxford's plan was more extensive; for his collection abounds also with curious MSS. in every science. This collection is now in the British Museum.

HARLEM ISLE, a small island lying off the north-west coast of Ceylon, about four miles in circumference. Lat. 9° 41' N., long. 79° 54' E. This island belongs to the district of Jaffnapatam, and affords excellent feed for horses.

HARL'EQUIN, n.s. This name is said to have been given by Frances of France to a busy buffoon, in ridicule of his enemy Charles le Quint. Menage derives it more probably from a famous comedian that frequented Mr. Harley's house, whom his friends called Harlequino, little Harley.—*Trev.* A buffoon who plays tricks to divert the populace; a jack-pudding; a zani.

The joy of a king for a victory must not be like that of a *harlequin* upon a letter from his mistress.

Dryden.

43

The man in graver tragick known, Though his best part long since was done, Still on the stage desires to tarry; And he who played the *harlequin*, After the jest still loads the scene, Unwilling to retire, though weary. *Prior*.

HARLEQUIN, a buffoon, dressed in party-colored clothes; answering much the same purpose as a merry andrew on mountebank stages, &c. Harlequin is a standing character in modern pantomime entertainments.

HARLES (Theophilus Christopher), an eminent German scholar and critic, was a native of Culmbach, in Suabia. In 1764 he was appointed adjunct of the faculty of philosophy at Erlangen, and the next year obtained the chair of Greek and Oriental literature in the gymnasium of Cobourg. He returned in 1770 to Erlangen, with the title of director of the philological seminary, librarian, and professor of rhetoric and poetry. His first publication was De Præconum apud Græcos officio, 1764; followed by his dissertations, De Pedantismo Philologico, Cobourg, 1765; and De Galantismo Æsthetico et Philologico, 1768. He also wrote the lives of various philologers in Latin, of which the second edition was published at Bremen, 1770, 1772. He edited, besides editions of several of the Greek and Roman classics, a Greek and Latin poetical Anthology, and introductions to the history of Greek and Latin Literature. But the most important of his labors is the second edition of the Bibliotheca Græca of Fabricius, published at Hamburgh, 1790-1809, 12 vols. 4to. His death took place November 2d, 1814, at the age of seventy-six.

HARLEY (Robert), earl of Oxford and Mortimer, was the eldest son of Sir Edward Harley, and born in 1661. At the Revolution Sir Edward and his son raised a troop of horse at their own expense; and, after the accession of king William and queen Mary, he obtained a seat in parliament. His promotions were rapid: in 1702 he was chosen speaker of the house of commons; in 1704 he was sworn of queen Anne's privy council, and made secretary of state; in 1706 he was one of the commissioners for the treaty of Union; and in 1710 was appointed a commissioner of the treasury, and chancellor of the exchequer. A daring attempt was made on his life, March 8th, 1711, by the marquis of Guiscard, a French papist; who, when under examination before a committee of the privy council, stabbed him with a penknife. Of this wound, however, he soon recovered ; and was the same year created earl of Oxford, and lord high treasurer, which office he resigned just before the queen's death. In 1715 he was impeached of high treason, and committed to the Tower; but was cleared by trial, and died on the 21st of May, 1724. He was not only an

encourager of literature, but the greatest collector in his time of curious books and MSS.

HARLINGEN, a sea-port town of the Netherlands, in Friesland. It stands on the coast of the Zuyder Zee, at the mouth of a large canal, and was only a hamlet till 1234, when it was destroyed by the sea; and, being afterwards rebuilt, became a considerable town. In 1543 and 1579 it was enlarged by William prince of Orange. It is now well fortified, and naturally strong, as the adjacent country can easily be laid under The city is square; and the streets are water. handsome, straight, and clean, with canals in the middle. But, though the harbour is good, vessels of great burden cannot get into it until they are lightened. The manufactures are salt, bricks, tiles, canvas, and paper; a considerable trade is also carried on in all sorts of linen cloth, and the adjacent country yields abundance of corn and pasturage. Population 7349. The town lies fifteen miles west of Lewarden, and is the seat of the naval administration of the province.

HAR'LOT, n. s. Welsh, herlodes, a girl. HAR'LOTRY, n. s. Others for horelet, a little whore. Others from the name of the mother of William the Conqueror. Harlot is used in Chaucer for a low male drudge. So far Johnson: but the word hire clearly supplies the etymology both of this word and whore; to both of which the Goth. hor; Dan. hore, answers. A whore; a strumpet. This word was, as Dr. Johnson says, formerly given to men as well as women. Herlod, in Welsh, is said to signify simply a young man, and herlodes a young woman: with us it seems always to have been a disgraceful appellation: harlotry, fornication; a name of contempt.

He was a gentil harlot and a kinde,

A better felow shulde a man not find.

Chaucer. Prologue to the Cant. Tales. He was a jangler, and a goliardeis,

And that was most of sinne and harlotries. Id. Thine be this might; I graunt it the;

My King of Harlotes shalt thou be.

Id. Romannt of the Rose.

A peevish self-willed harlotry,

That no persuasion can do good upon.

Shakspeare.

Away, my disposition, and possess me with Some harlot's spirit. Id. They help thee by such aids as geeso and harlots.

Ben Jonson. In very dark nights sometimes you may find him

With a harlot got up on my crupper behind him. Marvell.

The barbarous harlots crowd the publick place; Go, fools, and purchase an unclean embrace.

Dryden.

Nor shall,

From Rome's tribunal, thy harangues prevail 'Gainst *harlotry*, while thou art clad so thin. *Id.*

HARLOTS were tolerated amongst the Jews, Greeks, and Romans. Fornication indeed was prohibited among the Jews, under several severe penalties; but these they explained as extending only to women of their own nation; hence the word strange woman is often used to signify a harlot. At Athens also the prostitutes were mostly foreigners; and such as debauched an Athenian female were liable to a penalty. Co-

rinth was a remarkable nursery of harlots, and gave birth to the noted Lais. Their accomplishments were often great, in all the polite and elegant parts of female education, viz. philosophy, dancing, singing, rhetoric, &c. Aspasir, the mistress of Pericles, was admired by Socrates for her learning. The more accomplished frequently amassed great fortunes. Phryne offered to rebuild the walls of Thebes, when destroyed by Alexander, on condition that they would perpetuate her memory and profession by an inscription. At Rome they were obliged to fix a bill over their doors, indicating their character and profession. It was also customary for them to change their names, after they had signified to the prætor their intention of leading such a dissolute life. Women whose grandfather, father, or husband, had been a Roman knight, were forbidden by the laws to make a public profession of lewdness.

HARM, n. s. & v. a. HARM'FUL, adj. HARM'FULLY, adv. HARM'FULNESS, n. s. HARM'LESS, adj. HARM'LESSLY, adv.

Sax. anm; Goth. Swed. Dan. and Teut. harm. Injury; crime; wickedness; mischief; detriment; hurt: to hurt, or do injury. HARM'LESSNESS, n. s.) The adjectives and

adverbs imply the presence or absence of whatever is noxious, criminal, or injurious.

Ye wounded me, ye made me wo bestad ; Of grace, redresse my mortal grefe, as ye Of all my harm the very causer be.

Chaucer. The Court of Lovc. And, therto, I saw ner yet, a lesse Harmful than she was in doing : I say not that she n' hadde knowyng What harme ywas; or elles, she Had coulde no gode, so thinketh me.

Id. The Boke of the Duchesse.

A scholar is better occupied in playing or sleeping, than spending his time not only vainly, but harmfully in such kind of exercise. Ascham.

His dearly loved squire

His spear of heben-wood behind him bare. Whose harmful head, thrice heated in the fire,

Had riven many a breast with pike-head square. Spenser.

Touching ceremonies harmless in themselves, and hurtful only in respect of number, was it amiss to decree that those things that were least needful, and newliest come, should be the first that were taken Hooker. away?

She, like harmless lightning, throws her eye On him, her brothers, me, her master; hitting Each object with a joy. Shakspeare.

We, ignorant of ourselves,

Beg often our own harms, which the wise Powers Deny us for our good. Id.

What sense had I of her stolen hours of lust? I saw't not, thought it not, it harmed not me. Id.

The shipwright will be careful to gain by his labour, or at least to save himself harmless, and therefore suit his work slightly, according to a slight price.

Raleigh.

The earth brought forth fruit and food for man, without any mixture of harmful quality. Id.

When, through tasteless flat humility,

In dough-baked men some harmlessness we see, 'Tis but his phlegm that's virtuous and not he.

Donne.

Let no man fear that harmful creature less, because he sees the apostle safe from that poisen. Hall.

How are we happy still in fear of harm? But harm precedes not sin. Milton.

He spent that day free from worldly trouble, harmlessly, and in a recreation that became a churchman. Walton.

Passions ne'er could grow

To harm another, or impeach your rest. Waller.

For flax and oats will burn the tender field, And sleepy poppies harmful harvests yield.

Dryden.

After their young are hatched, they brood them under their wings, lest the cold, and sometimes the heat, should harm them. Ray.

Secure and free they pass their hurmless hours, Gay as the birds that revel in the grove

And sing the morning up. Tate's Loyal General.

Compare the harmlessness, the credulity, the tenderness, the modesty, and the ingenuous pliahleness to virtuous counsels, which is in youth untainted, with the mischievousness, the slyness, the craft, the impudence, the falsehood, and the confirmed obstinacy in an aged long-practised sinner. South.

They should be suffered to write on : it would keep them out of harm's way, and prevent them from evil courses. Swift.

And the loud hunters' shout ; O'er a weak harmless flying creature all

Mixed in mad tumult aud discordant joy.

Thomson.

Bullets batter the walls which stand inflexible, but fall harmlessly into wood or feathers.

Decay of Piety.

Thus Harold deemed, as on that lady's eye He looked and met its beam without a thought, Save admiration glancing harmless by.

Byron. Childe Harold.

HARMATTAN, a remarkable periodical wind which blows from the interior parts of Africa towards the Atlantic Ocean. It is described in the Philosophical Transactions as an easterly wind prevailing on that part of the coast of Africa which lies between Cape Verd in lat. 15° N., and Cape Lopez in lat. 1° S., during December, January, and February.

' This wind is by the French and Portuguese, who frequent the Gold coast, called simply the north-east wind, the quarter from which it blows. The English adopt the Fantee word harmattan. It comes on indiscriminately at any hour of the day, at any time of the tide, or at any period of the moon, and continues sometimes only a day or two, sometimes five or six days, and it has been known to last fifteen or sixteen. There are generally three or four returns of it every season. It blows with a moderate force, not quite so strong as the sea-breeze (which blows every day during the fair season from the west. W.S.W., and south-west); but somewhat stronger than the land wind at night from the north and N.N.W. A fog is one of the peculiarities which always accompanies the harmattan. Extreme dryness makes another extraordinary property of this wind. No dew falls during its continuance, nor is there the least appearance of moisture in the atmosphere. Vegetables of every kind are very much injured; all tender plants, and most of the productions of the garden, are destroyed; the grass withers, and becomes dry like hay; the vigorous evergreens likewise feel its pernicious influence; the branches of the

lemon, orange, and lime-trees droop; the leaves become flaccid, wither, and, if the harmattan continues to blow for ten or twelve days, are so parched as to be easily rubbed to dust between the fingers : the fruit of these trees, deprived of its nourishment, and stinted in its growth, becomes yellow and dry, without acquiring half its usual size. The parching effects of this wind are likewise evident on the external parts of the body. The eyes, nostrils, lips, and palate, are rendered dry and uneasy, and drink is often required, not so much to quench thirst, as to re-move a painful aridity in the fauces. The lips and nose become sore, and even chapped; and, though the air be cool, yet there is a troublesome sensation of prickling heat on the skin. If the harmattan continues four or five days, the scarfskin peels off, first from the hands and face, and afterwards from the other parts of the body, if it continues a day or two longer. Those laboring under fluxes and intermitting fevers, however, generally recover in a harmattan. It stops the progress of epidemics : the small pox, remittent fevers, &c., not only disappear, but those laboring under these diseases when an harmattan comes on, are almost certain of a speedy recovery.'

HARMER (Thomas), an oriental scholar and bublical critic, was a native of Norwich, where he was born in 1715. He received his education at a private academy in London, but his progress in the languages of the east was considerable, which is evinced in his annotations on Solomon's Song. But his best work is Observations on divers parts of Scripture, illustrated by the accounts of Travellers in the East, 4 vols. 8vo.; a treatise which has gone through several editions. He died in 1788, minister of a dissenting congregation at Wattesfield, Suffolk.

HARMODIUS, the friend of Aristogiton, who delivered his country from the tyranny of the Pisistratidæ. See ARISTOGITON, and ATTICA. The Athenians, to reward the patriotism of these illustrious citizens, made a law, that no person (according to some), or, as others with more probability affirm, no slave, should ever after be named Aristogiton or Harmodius.

HARMONIA, or HERMIONE, in fabulous history, the wife of Cadmus, both of whom were turned into serpents. See CADMUS. Though many ancient authors make Harmonia a princess of divine origin, the daughter of Mars and Venus, Athenæus, quoting Euhemerus, tells us, that she was only a player on the flute, in the service of the prince of Zidon, previous to her departure with Cadmus. This circumstance renders it probable, that, as Cadmus brought letters into Greece, his wife brought music thither. HARMONICA. This word, when originally

HARMONICA. This word, when originally appropriated by Dr. Franklin to that peculiar form or mode of musical glasses which he himself, after a number of happy experiments, first contrived, was written armonica. It is derived from the Greek word $\dot{a}\rho\mu\nu\nu\alpha$. The Dr., in his letter to F. Beccaria, has given a minute and elegant account of the harmonica. 'You have doubtless heard,' says he, 'the sweet tone that is drawn from a drinking glass, by pressing a wet finger round its brim. One Mr. Puckeridge, a gentleman from Ireland, was the

first who thought of playing tunes formed of these tones. He collected a number of glasses of different sizes; fixed them near each other on a table; and tuned them, by putting into them water more or less as each note required. The tones were brought out by pressing his fingers round their brims. He was unfortunately burnt here, with his instrument, in a fire which consumed the house he lived in. Mr. E. Delaval, a most ingenious member of our Royal Society, made one in imitation of it with a better choice and form of glasses, which was the first I saw or heard. Being charmed with the sweetness of its tones, and the music he produced from it, I wished to see the glasses disposed in a more convenient form, and brought together in a narrower compass, so as to admit of a greater number of tones, and all within reach of hand to a person sitting before the instrument; which I accomplished after various intermediate trials, and less commodious forms, both of glasses and construction, in the following manner :- The glasses are blown as near as possible in the form of hemispheres, having each an open neck or socket in the middle. The thickness of the glass near the brim is about the tenth of an inch, or hardly quite so much, but thicker as it comes nearer the neck; which in the largest glasses is about an inch deep, and an inch and a half wide within; these dimensions lessening as the glasses themselves diminish in size, except that the neck of the smallest ought not to be shorter than half an inch. The largest glass is nine inches diameter, and the smallest three inches. Between these are twenty-three different sizes, differing from each other a quarter of an inch in diameter. To make a single instrument, there should be at least six glasses blown of each size; and out of this number one may probably pick thirty-seven glasses (which are different for three octaves with all the semitones) that will be each either the note one wants, or a little sharper than that note, and all fitting so well into each other as to taper pretty regularly from the largest to the smallest. It is true there are not thirty-seven sizes; but it often happens that two of the same size differ a note or half a note in tone, by reason of a difference in thickness, and these may be placed in the other without sensibly hurting the regularity of the taper, form. The glasses being chosen, and every one marked with a diamond the note you intend it for, they are to be tuned by diminishing the thickness of those that are too sharp. This is done by grinding them round from the neck towards the brim, the breadth of one or two inches as may be required; often trying the glass by a well tuned harpsichord, comparing the note drawn from the glass by your finger with the note you want, as sounded by that string of the harpsichord. When you come near the matter, be careful to wipe the glass clean and dry before each trial, because the tone is something flatter when the glass is wet, than it will be when drying;-and, grinding a very little between each trial, you will thereby tune to great exactness. The more care is necessary in this, because if you go below your required tone there is no sharpening it again but by grinding somewhat off the brim, which will

afterwards require polishing, and thus increase the trouble. The glasses being thus tuned, you are to be provided with a case for them, and a spindle on which they are to be fixed. My case is about three feet long, eleven inches every way wide within at the biggest end, and five inches at the smallest end; for it tapers all the way to adapt it better to the conical figure of the set of glasses. This case opens in the middle of its height, and the upper part turns up by hinges fixed behind. The spindle is of hard iron, lies horizontally from end to end of the box within, exactly in the middle, and is made to turn on brass gudgeons at each end. It is round, an inch in diameter at the thickest end, and tapering to a quarter of an inch at the smallest .--- A square shank comes from its thickest end through the box, on which shank a wheel is fixed by a screw. This wheel serves as a fly to make the motion equable, when the spindle, with the glasses, is turned by the foot like a spinning wheel. My wheel is of mahogany, eighteen inches diameter, and pretty thick, so as to conceal near its circumference about twenty-five pounds of lead .- An ivory pin is fixed in the face of this wheel, about four inches from the axis. Over the neck of this pin is put the loop of the string, that comes up from the moveable step to give it motion. The case stands on a neat frame with four legs. To fix the glasses on a spindle, a cork is first to be fitted in each neck pretty tight, and projecting a little without the neck, that the neck of one may not touch the inside of another when put together, for that would make a jarring. These corks are to be perforated with holes of different diameters, so as to suit that part of the spindle on which they are to be fixed. When a glass is put on, by holding it stiffly between both hands, while another turns the spindle, it may be gradually brought to its place. But care must be taken that the hole be not too small, lest in forcing it up the neck should split; nor too large, lest the glass, not being firmly fixed, should turn or move on the spindle, so as to touch or jar against its neighbouring glass. The glasses thus are placed one in another; the largest on the biggest end of the spindle, which is to the left hand : the neck of this glass is towards the wheel; and the next goes into it in the same position, only about an inch of its brim appearing beyond the brim of the first; thus proceeding, every glass when fixed shows about an inch of its brim (or three quarters of an inch, or half an inch, as they grow smaller) beyond the brim of the glass that contains it; and it is from these exposed parts of each glass that the tone is drawn, by laying a finger on one of them as the spindle and glasses turn round. My largest glass is G, a little below the reach of a common voice, and my highest G, including three complete octaves .- To distinguish the glasses more readily to the eye, I have painted the apparent parts of the glasses within-side, every semitone white, and the other notes of the octave with the seven prismatic colors; viz. C, red; D, orange; E, yellow; F, green; G, blue; A, indigo; B, purple; and C, red again ;--so that the glasses of the same color (the white excepted) are always octaves to each

other. This instrument is played upon by sitting before the middle of the set of glasses, as before the keys of a harpsichord, turning them with the foot, and wetting them now and then with a sponge and clean water. The fingers should be first a little soaked in water, and quite free from all greasiness; a little fine chalk is sometimes useful, to make them catch the glass and bring out the tone more readily. Both hands are used, by which means different parts are played together .-- Observe, that the tones are best drawn out when the glasses turn from the ends of the fingers, and not when they turn to them. The advantages of this instrument are, that its tones are incomparably sweet beyond those of any other; that they may be swelled and softened at pleasure by stronger or weaker pressures of the finger, and continued to any length; and that the instrument, being once well tuned, never again wants tuning.' Some have proposed to use cork instead of the finger, but this substitute does not seem capable of producing the same mellowness and equality of tone with the finger. Alum water is also thought preferable to chalk. From what has already been said, it will easily be perceived, that this instrument requires to be tuned with the nicest degree of delicacy which the laws of temperament will possibly admit. The same rules, however, which are observed in tuning a harpsichord, will be equally effectual in tuning the harmonica; with this only difference, that greater delicacy in adjusting the chords should, if practicable, be attempted. Dr. Edmund Cullen, of Dublin, made what he considered an improvement on this instrument; but it is objected by connoisseurs, that a full bass cannot be executed upon it; and that the complete bass, practicable on the harmonica, is greatly preferable to the chords with which the Dr. proposes to grace each emphatic note, and with which, they allege, he deludes instead of satisfying the ear.

HARMON'ICAL, adj.	Fr. harmonique;
HARMON'IC, adj.	Greek, appovinos.
HARMO'NIOUS, adj.	Originally from Gr.
HARMO'NIOUSLY, adv.	>aow, to fit or suit,
	and signifies a state
HAR'MONISE, v. a.	of fitness, suita-
TT /	hiliter on owned

HAR'MONY, n. s. J bility, or agreement; applied to sounds and to minds, and in both implies adaptation: in music, the adaptation of different modulated sounds to each other; in mind, co-operation of thought, sentiment, or affection: symmetrical; proportionate. Harmonise, to adjust equally.

On every bough, the birdes herd I syng With voice of Angell in hir harmonie. Chaucer. The Assemblie of Foules.

For al my chambre gan to ringe; Through singing of hir harmony, For instrument nor melody Wos no where herde yet, halfe so swele, Nor of accorde halfe so mete. Id. Boke of the Duchesse,

The pleasures of the eye and ear are but the effects of equality, good proportion, or correspondence; so that equality and correspondence are the causes of Bacon. harmony.

Harmonical sounds, and discordant sounds, are both active and positive ; the blackness and darkness are, Id. indeed, but privaties.

After every three whole notes, nature requireth, for all harmonical use, one half note to be interposed. Id.

All the wide-extended sky,

And all the harmonious worlds on high,

And Virgil's sacred work shall dye. Cowley. The harmony of things,

As well as that of sounds, from discord springs. Denham.

In us both one soul,

Harmony to behold in wedded pair ! More grateful than harmonious sounds to the' ear.

Milton.

I no sooner in my heart divined, My heart, which by a secret harmony Still moves with thine, joined in connexion sweet! Id.

The sound

Symphonious, of ten thousand harps that tuned Angelic harmonies. Id.

Thoughts that voluntary move harmonious numbers. Id.

Each sort a consort in that lovely place, And virgin trebles wed the manly base From whence the progeny of numbers new Into harmonious colonies withdrew. Marvell.

If we look upon the world as a musical instrument, well-tuned, and harmoniously struck, we ought not to worship the instrument, but him that makes the mu-Stillingfleet. sick.

Love first invented verse, and formed the rhime, The motion measured, harmonized the chime.

Dryden. The verse of Chaucer is not harmonious to us; they who lived with him, thought it musical. Id.

God has made the intellectual world harmonious and beautiful without us; but it will never come into our heads all at once : we must bring it home piecemeal. Locke.

That all these distances, motions, and quantities of matter should be so accurately and harmoniously adjusted in this great variety of our system, is above the fortuitous hits of blind material causes, and must certainly flow from that eternal fountain of wisdom. Bentley.

Sure infinite wisdom must accomplish all its works with consummate harmony, proportion, and regularity. Cheyne.

Not chaos-like, together crushed and bruised ; But as the world, harmoniously confused : Where order in variety we see,

And where, though all things differ, they agree.

Pope.

So swells each wind-pipe ; ass intones to ass, Harmonic twang of leather, horn, and brass. Id.

Harmony is a compound idea, made up of different sounds united. Watts.

Now the soft hour

Of walking comes for him who lonely loves To seek the distant hills, and there converse With Nature; there to harmonize his heart, And in pathetic song to breath around The harmony to others. Thomson.

Every copse

Deep-tangled, tree irregular and bush Bending with dewy moisture, o'er the heads Of the coy quiristers that lodge within,

Are prodigal of harmony. Id. Scasons.

Then let the winds howl on ! their harmony Shall henceforth be my music.

Byron's Childe Harold.

HARMONY. The sense which the Greeks gave to this word, in their music, is not easy to be determined. In the ancient treatises that are extant harmony appears to be that department whose object is the agreeable succession of sounds, merely considered as high or low; in opposition to the two others called rhythmica and metrica, which have their principle in time and measure. This leaves our ideas concerning that aptitude of sound vague and undetermined; nor can we fix them without studying for that purpose all the rules of the art; and, even after we have done so, it will be very difficult to distinguish harmony from melody, unless we add to the last the ideas of rhythmus and measure; without which, in reality, no melody can have a distinguishing character: whereas harmony is characterised by its own nature, independent of all other quantities except the chords or intervals which compose it. It appears by a passage of Nicomachus, and by others, that they likewise gave the name of harmony to the chord of an octave. and to concerts of voices and instruments, which performed in the distance of an octave one from the other, and which is more commonly called antiphone. Harmony, according to the moderns, is a succession of chords agreeable to the laws of modulation. For a long time this harmony had no other principle but such rules as were almost arbitrary, or solely founded on the approbation of a practised ear, which decided concerning the agreeable or disagreeable succession of chords, and whose determinations were at last reduced to calculation. But F. Mersenne and M. Saveur having found that every sound, however simple in appearance, was always accompanied with other sounds less sensible, which constitute with itselfa perfect chord-major with this experiment M. Rameau set out, and upon it formed the basis of his harmonic system, which he extended to many volumes. Signior Tartini, taking his route from an experiment which is more delicate, yet not less certain, reached conclusions similar to those of Rameau, by pursuing a path whose direction seems quite opposite. According to M. Rameau, the treble is generated by the bass; Signior Tartini makes the bass result from the treble. One deduces harmony from melody, and the other supposes the contrary. To determine from which of the two schools the best performances are likely to proceed, no more is necessary than to investigate the end of the composer, and discover whether the air is made for the accompaniments, or the accompaniments for the air. At the word system, in Rousseau's Musical Dictionary, is given a delineation of that published by Signior Tartini. Here he continues to speak of M. Rameau, whom he has followed through this whole work, as the artist of greatest authority in the country where he writes. In reality, when this author took it in his head to dignify with the title of demonstration the reasonings upon which he established his theory, every one turned the arrogant pretence into ridicule. The Academy of Sciences loudly disapproved a title so ill founded, and so gratuitously assumed; and M. Estive, of the Royal Society at Montpelier, has shown him, ' that, even to begin with this proposi-

48

are represented by their octaves, and that the octaves may be substituted for them, there was not any one thing demonstrated or even firmly established, in his pretended demonstration.' But without quoting his arguments, which are too long for insertion, we readily grant, that the system of harmony by M. Rameau is neither demonstrated, nor capable of demonstration. But it will not follow, that any man of invention can so easily and so quickly subvert those aptitudes and analogies on which the system is founded. Every hypothesis is admitted to possess a degree of probability proportioned to the number of phenomena for which it offers a satisfactory solution. The first experiment of M. Rameau is, that every sonorous body, together with its principal sound and its octave, gives likewise its twelfth and seventeenth major above; which being approximated as much as possible, even to the chords immediately represented by them, return to the third, fifth, and octave, or, in other words, produce perfect harmony. This is what nature, when solicited, spontaneously gives; this is what the human ear, unprepared and uncultivated, imbibes with ineffable avidity and pleasure. We do not contend for the truth of M. Rameau's Nor is it necessary we second experiment. should. The first, expanded and carried into all its consequences, resolves the phenomena of harmony in a manner sufficient to establish its authenticity and influence. The difficulties for which it affords no solution are too few and trivial either to merit the regard of an artist, or a philosopher, as M. D'Alembert, in his Elements, has clearly shown. Rousseau and his opponent are agreed in this, that the harmonics conspire to form one predominant sound; and are not to be detected but by the nicest organs, applied with the deepest attention. It is equally obvious, that, in an artificial harmony, by a proper management of this wise institution of nature, dissonances themselves may be either entirely concealed or considerably softened. So that, since by nature sonorous bodies in actual vibration are predisposed to exhibit perfect harmony, and since the human ear is fabricated in such a manner as to perceive it, the harmonical chaos of M. Rousseau has in fact no existence. Nor does it avail him to pretend, that, before the harmonics can be extinguished, sonorous bodies must be impelled with a force which alters the chords, and destroys the purity of the harmony; for this position is equally false both in theory and practice: in theory, because an impulse, however forcible, must proportionally operate on all the parts of any sonorous body, so far as it extends; in practice, because the human ear actually perceives the harmony to be pure. What effects his various manœuvres upon the organ may have, we leave to such as have leisure and curiosity enough to try the experiments ; but it is apprehended, that, when tried, their results will leave the system of Rameau, particularly as remodelled by D'Alembert, in its full force. Of all the whims and paradoxes maintained by this philosopher, none is more extravagant than his assertion, that every chord, except the simple unison, is displeasing to the human ear; nay,

that we are only reconciled to octaves themselves, by being inured to hear them from our infancy. Strange, that nature should have fixed this invariable proportion between male and female voices, whilst at the same time she inspired the hearers with such violent prepossessions against it, as were invincible but bylong and confirmed habit. See Music, &c.

HARMONY, DIRECT, is that in which the bass is fundamental, and in which the upper parts preserve among themselves, and with that fundamental bass, the natural and original order which ought to subsist in each of the chords that compose this harmony.

HARMONY, INVERTED, is that in which the fundamental or generating sound is placed in some of the upper parts, and when some other sound of the chord is transferred to the bass beneath the others.

HARMONY, a village of the United States, in the county of Gibson Indiana; famous as a recent property of the eccentric but benevolent Mr. Owen. It is seated on the Wabash, and is so called from being settled by a sect called the Harmonists, who held their property in common, and sold it to Mr. Owen. They had a very extensive establishment here for the manufacture of wool, and their Merino cloth was said not to be surpassed by any in the United States. They also cultivated the vine.

HARMOSTA, or HARMOSTES, Greek 'A $\rho\mu\sigma\eta\sigma$ from $d\rho\mu\sigma\omega$, to adapt. In antiquity, a magistrate among the Spartans, whereof there were several, whose business was to look to the building of citadels, and repairing the forts and fortifications.

HARMOSYNIANS, άρμοσυνοι, in antiquity, magistrates among the Spartans, who, after the death of Lycurgus, were appointed to enforce the observance of that law which required married women to wear veils in the streets; whereby, they were distinguished from single females, who were allowed to go abroad with their faces uncovered.

HARNESS, n. s. & v. a. Fr. harnois; supposed from Runick iern or hiern; Welsh and Erse hiairn, iron. Mr. Thomson says, from Goth. her, an army. Armour; defensive furniture of war; somewhat antiquated. The traces of draught-horses, particularly of carriages of pleasure: to dress in armour; or to fix horses in their traces.

Harness the horses, and get up the horsemen, and stand forth with your helmets. Jer. xlvi. 4.

These folke taken litel regard of the riding of Goddes son of heven, and of his *harneis*, whan he rode upon the asse, and had non other *harneis* but the poure clothes of his disciples, ne we rede not that ever he rode on any other beste.

Chaucer. The Persones Tale.

But all hir horse *harneis* and other gere, Was in a sute, according everichone,

As ye have herd the foresaid trumpels were.

Id. The Floure and the Leaf. Before the door her iron chariot stood,

All ready harnessed for journey new. Spenser.

A goodly knight, all dressed in harness meet, That from his head no place appeared to his feet.

Id.

Of no right, nor colour like to right, He doth fill fields with harness. Shakspeare. He was harnessed light, and to the field goes he. Id.

Or wilt thou ride? thy horses shall be trapped, Their harness studded all with gold and pearl. Id.

Were I a great man, I should fear to drink : Great men should drink with harness on their throats.

Id. When I plow my ground, my horse is harnessed

and chained to my plough. Hale's Origin of Mankind.

Their steeds around,

Free from their harness, graze the flowery ground. Dryden.

Full fifty years harnessed in rugged steel," I have endured the biting winter's blast! Rowe.

To the harnessed yoke

They lend their shoulder, and begin their toil.

Thomson.

HARNESS comprehends the whole equipage and accoutrements of a cavalier heavily armed; as casque, cuirass, &c. Some derive the word from the Greek aprazic, a lamb's skin, because they anciently covered themselves therewith. Du Cange observes, that the word harnesium is used in the corrupt Latin in the same sense, and that it comes from the High Dutch harness or harnisch. Others derive it from the Italian arnese; others from the Celtic harnes, a cuirass. -Under king Richard II. stat. 7, c. 13, it was expressly forbidden to ride in harness with launcegays. In stat. 2 Henry VI., c. 14, harness seems to include all kinds of furniture for offence as well as defence, both of men and horses; as swords, buckles for belts, girdles, &c.

HARO, HAROL, or HAROU, or Clamour de Haro, in the Norman customs, was a cry or formula of invoking the assistance of justice against the violence of some offender, who, upon hearing the word haro, was obliged to desist, on pain of being severely punished for his outrage, and to go with the party before the judge. The word is commonly derived from ha and roul, as being supposed an invocation of the sovereign power, to assist the weak against the strong; from Raoul first duke of Normandy, who, about A. D. 912, rendered himself venerable by his strict justice: so that they called on him even after his death when they suffered any oppression. Some derive it from Harold king of Denmark, who in 826 was made grand conservator of justice at Mentz. Others from the Danish aa, rau, q. d. help me; a cry raised by the Normans in flying from a king of Denmark, named Roux, who made himself duke of Normandy. The letters of the French chancery had formerly this clause, Nonobstant clameur de haro, &c. The haro had anciently such vast power, that a poor man of Caen, named Asselin, in virtue of it, arrested the corpse of William the Conqueror, in the middle of the funeral procession, till his son Henry paid the value of the land whereon the chapel was built in which he was interred.

HAROLD I. and III. See ENGLAND.

HAROMSZEK, a province of Transylvania, at the south-east corner of the country of the Szeklers, adjoining to European Turkey. The Carpathian Mountains are its barrier on this side. It is divided into the upper and lower circles.

VOL. XI.

containing seven districts, and is intersected by various steep mountains, but has valleys along the banks of the Alt and the Teketengy, beautifully fertile. Its extent is about 800 square miles; and there are 4080 families who pay taxes. The inhabitants cultivate flax, and manufacture linen.

HARP, n. s. & v. n. HARP'ER, n. s. Sax. beapp; Fr. harpe. It is used through both

HARF'SICHORD, n. s. the Teutonic and Roman dialects, Romanusq; lyrá plaudat tibi, Barbarus harpâ. Ven. Fort. An instrument commonly struck with the finger; a constellation; one who plays on the harp: to touch any passion; to dwell on a subject.

Things without life giving sound, whether pipe or *harp*, except they give a distinction in the sounds, how shall it be known what is piped or *harped*?

1 Cor.

I heard the voice of harpers harping with their harps. Revelations.

There herde I playing on an harpe That younded hothe well and sharpe, Hym Orpheus, full craftely And on this side fast by, Ysatte the harper Orion, And Gaeides Chirion, And other harpers many one, And the British Gaskirion ; And small harpers with hir glees Satte under hem in divers sees.

Chaucer. House of Fame.

Such as was Orpheus, that, when strife was growen Amongst those famous ympes of Greece did take

His silver harpe in hand, and shortly friends them make. Spenser's Faerie Queene.

Arion, when through tempest's cruel wreck,

He forth was thrown into the greedy seas,

Through the sweet musick which his harp did make,

Allured a dolphin him from death to ease. Id. Gracious duke,

Harp not on that, nor do not banish reason

For inequality; but let your reason serve

To make the truth appear.

Shakspeare. Measure for Measure.

For thy good caution, thanks :

Thou'st harped my fear aright. Id. Macbeth. He seems

Proud and disdainful, harping on what I am, Not what he knew I was.

Id. Antony and Cleopatra.

Never will I trust to speeches penned, Nor to the motion of a schoolboy's tongue :

Nor woo in rhime, like a blind harper's song.

Shakspearc.

Next shines the *harp*, and through the liquid skies The shell, as lightest, first begins to rise; This when sweet Orpheus struck, to list'ning rocks

He senses gave, and ears to withered oaks. Creech. The helmed cherubim,

And sworded seraphim.

Are seen in glittering ranks with wings displayed,

Harping in loud and solemn quire,

- With unexpressive notes to heaven's new-born heir. Milton.
 - They touched their golden harps, and hymning praised

God and his works. Id. Nor wanted tuneful harp, nor vocal quire; The muses sung, Apollo touched the lyre.

A Dryden.

 \mathbf{E}_{-}

You harp a little too much upon one string. Collier.

I'm the god of the harp: stop my fairest :---in vain;

Nor the harv, nor the harper, could fetch her again. Tickell.

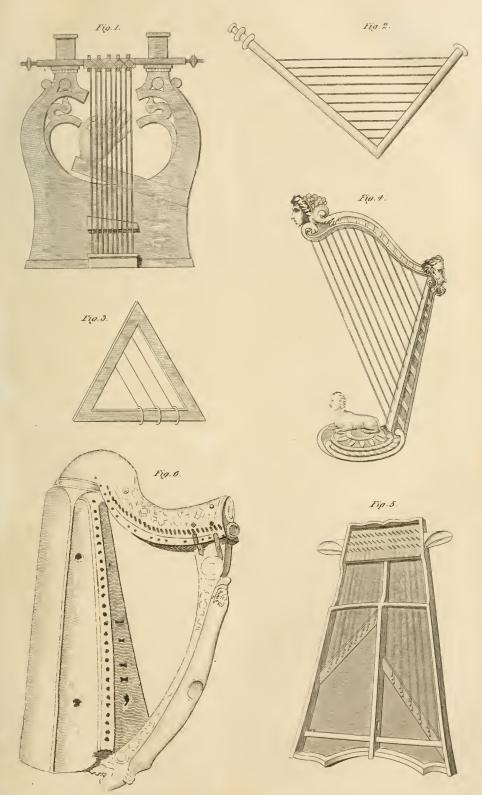

The HARP is of a triangular figure, and held upright between the legs of the performer. The harp was the favorite musical instrument of the Britons and other northern nations in the middle ages; as is evident from their laws, and various passages in their history. By the laws of Wales, a harp was one of the three things that were necessary to constitute a gentleman, or a freeman: and none could pretend to that character who had not one of these favorite instruments, or could not play upon it. To prevent slaves from pretending to be gentlemen, it was expressly forbidden to teach, or to permit, them to play upon the harp ; and none but the king, the king's musicians, and gentlemen, were allowed to have harps in their possession. A gentleman's harp was not liable to be seized for debt, because the want of it would have degraded him from his rank, and reduced him to that of a slave. The harp was in no less estimation and universal use among the Saxous and Danes. Those who played upon this instrument were declared gentlemen by law; their persons were esteemed inviolable, and secured from injuries by very severe penalties ; they were readily admitted into the highest company, and treated with distinguished marks of respect wherever they appeared. King David is usually painted with a harp, but we have no testimony in all antiquity that the Hebrew harp, which they called chinnor, was any thing like ours. On a Hebrew medal of Simon Maccabæus we see two sorts of musical instruments; but they are both very different from our harp, and consist of only three or four strings. All authors agree, that our harp is very different from the lyra, cithara, or barbiton, used among the Romans. Fortunatus, lib. vii. carm. 8. Romanusque lyrâ plaudat tibi, Barbarus harpâ, mentions it as an instrument of the barbarians.

HARPS, ANCIENT :- Fig. 1. Plate HARPS, is a well authenticated representation of a Greek harp or lyre. Fig. 2. represents a trigonum or triangular harp, taken from an ancient painting in the museum of the king of Naples, in which it is placed on the shoulder of a little dancing Cupid, who supports the instrument with his left hand, and plays upon it with his right. The trigonum is mentioned by Athenxus, lib. iv. and by Julius Pollux, lib. iv. cap. 9. According to Athenaus, Sophocles calls it a Phrygian instrument; and one of his dipnosophists tells us, that a certain musician, named Alexander Alexandrinns, was such an admirable performer upon it, and had given such proofs of his abilities at Rome, that he made the inhabitants µησομανιεν, ' musically mad.' Fig. 3 is a variety of the same instrument. Fig. 4 is the Theban harp, according to a drawing made from an ancient painting in one of the sepulchral grottos of the first kings of Thebes, and communicated by Mr. Bruce to Dr. Burney. The performer is clad in a habit made like a shirt, such as the women still wear in

Abyssinia, and the men in Nubia. It reacnes down to his ancles; his feet are without sandals, and bare; his neck and arms are also bare; his loose white sleeves are gathered above his elbows; and his head is closely shaved. His left hand seems employed in the upper part of the instrument, among the notes in alto, as if in an arpeggio; while, stooping forwards, he seems with his right hand to be beginning with the lowest string and promising to ascend with the most rapid execution: this action, so obviously represented by an indifferent artist, shows that it was a common one in his time; or, in other words, that great hands were then frequent, and consequently that music was well understood and diligently followed.

HARP, THE BELL, a musical instrument of the string kind, thus called from the players on it swinging it about, as a bell on its basis. It is about three feet long; its strings, which are of no determinate number, are of brass or steel wire, fixed at one end, and stretched across the sound-board by screws fixed at the other. It takes in four octaves, according to the number of the strings, which are struck only with the thumbs, the right hand playing the treble, and the left hand the bass : and, in order to draw the sound the clearer, the thumbs are armed with a little wire pin. See Plate HARPS, fig. 5.

HARP, THE IRISH, represents the harp of Brian Boiromh, king of Ireland, slain in battle with the Danes, A. D. 1014, at Clontarf. His son Donagh having murdered his brother Teig, A. D. 1023, and being deposed by his nephew, retired to Rome, and carried with him the crown, harp, and other regalia of his father, which he presented to the pope in order to obtain absolution. Adrian IV, alleged this as one of his principal titles to this kingdom, in his bull transferring it to Henry H. These regalia were kept in the Vatican till the pope sent the harp to Henry VIII. with the title of Defender of the Faith; but kept the crown, which was of massive gold. Henry gave the harp to the first earl of Clanricard; in whose family it remained till the beginning of the eighteenth century, when it came by a lady of the De Burgh family into that of M'Mahon of Clenagh in the county of Clare, after whose death it passed into the possession of commissioner M'Namara of Limerick. In 1782 it was presented to the right honorable William Conyngham, who deposited it in Trinity College library. It is thirty-two inches high, and of extraordinary good workmanship; the sounding board is of oak, the arms of red sallow; the extremity of the uppermost arm in part is capped with silver, extremely well wrought and chiseled. It contains a large crystal set in silver, and under it was another stone now lost. The buttons or ornamental knobs at the sides of this arm are of silver. On the front arm are the arms, chased in silver, of the O'Brien family, the bloody hand supported by lions. On the sides of the front arm, within two circles, are two Irish wolf dogs cut in the wood. The holes of the sounding board, where the strings entered, are neatly ornamented with escutcheons of brass carved and gilt; the larger sounding holes have been orna-

.

mented, probably with silver, as they have been the object of theft. This harp has twenty-eight keys, and as many string holes, consequently there were as many strings. The foot-piece or rest is broken off, and the parts round which it was joined are very rotten. The whole bears evidence of an expert artist.

HARP, THE WELSH, or the TRIPLE HARP, has ninety-seven strings or chords in three rows, extending from C in the tenor cliff to double G in alt, which make five octaves : the middle row is for the semitones, and the two outside rows are perfect unisons. On the bass side, which is played with the right hand, there are thirty-six strings; on the treble side, twenty-six; and in the middle row, thirty-five strings. There are two rows of pins or screws on the right side, serving to keep the strings tight in their holes, which are fastened at the other end to three rows of pins on the upper side. The harp, within the last sixty years, has been in some degree im-proved by the addition of eight strings to the unison, viz. from E to double F in alt. This instrument is struck with the finger and thumb of both hands. Its music is much like that of the spinet, all its strings going from semitone to semitone; whence some call it an inverted spinet. It is capable of a much greater degree of perfection than the lute.

HARPAGINES, $A\rho\pi a\gamma\epsilon\varsigma$, in antiquity, were hooks of iron, hanging on the top of a pole, which, being secured with chains to the masts of ships, and then let down with great velocity into the enemy's vessels, caught them up into the air. By way of defence against these machines, they covered their ships with hides, which broke and blunted the force of the iron. The harpagines were invented by Anacharsis the Scythian philosopher.

HARPAGIUS, the preserver of Cyrus, according to Herodotus, and afterwards one of his generals, who subdued Asia Minor. See PERSIA.

HARPALUS, a Greek astronomer, who flourished about A. A. C. 480, corrected the cycle of eight years invented by Cleostratus; and proposed a new one of nine years, in which he imagined the sun and moon returned to the same point. But Harpalus's cycle was afterwards altered by Meton, who added ten full years to it. See CHRONOLOGY.

HARPALYCE, in fabulous history, the daughter of Lycurgus king of Thrace, and queen of the Amazons, who by her valor set her father at liberty, after he had been taken prisoner by the Getes.

HARPASA, a town of Caria, on the Harpasus, famous for an immense rocking stone, which was moveable by the finger, but could not be displaced by any force.

HARPATH, a river of the United States, in Tennessee, which runs into the Cumberland, fourteen miles south-east of Clarksville.

HARPE (Jean François de la) was born at Paris on the 20th of November, 1739. He lost his father, who was captain of artillery, when he was very young, and was left in a state of extreme poverty. By some accident he was introduced to M. Asselin, principal of the college of Har-

court, who, hearing him recite some French verses with an elegance and taste superior to his years, received him amongst his pupils, and shortly after obtained a pension for him. The patronage of his benevolent friend was happily bestowed, and no care was omitted in the completion of his studies. La Harpe commenced his public career in letters by poems called Heroides, which were then much in vogue. The Epistle of Barnevelt to Traman his friend, by Dorat; and that of a monk of La Trappe to the Abbé de Rance, by La Harpe, were very popular. These trifles were but the prelude to nobler success. To a young man who had destined himself to a literary life, two paths were open,-the honors of the academy and those of the theatre. A prize obtained at the French academy, or a successful drama, would remove the first difficulties, admit him into the higher circles, and procure him elevated protectors. La Harpe almost in the same moment attempted both, and In the his first efforts in each were successful. Eulogy on Fenelon the writer seems to be clothed with the mantle of that illustrious prelate, to speak worthily of his talents and virtues. To the intrinsic merit of this eulogy, one of the finest composed by La Harpe, was joined the extraneous and accidental interest of being proscribed by the minister, and the work was from that but the more eagerly sought for. The true chef d'œuvre of M. de la Harpe, however, in these compositions, is the Eulogy on Racine, a subject entirely his own choice. There is nothing to censure in it but an excess of severity in speaking of the great Corneille. The year 1775 was celebrated in our author's life, he having obtained in it both the prize of eloquence and that of poetry. The subject of the oration was an Eulogy on Catinat. It was difficult that an orator, absolutely a stranger to the military art, should succeed in depicting the exploits of one of the greatest generals. M. de la Harpe had also, as a competitor, a man of merit, protected at court, not unsuccessful in letters, and who had made tactics a particular study. The orator was not moved by any of these obstacles. The academy sometimes proposed particular questions, and in 1767 the prize for the following was gained by La Harpe-' Of the Miseries of War, and the Advantages of Peace.' This discourse was marked by the purity and elegance of its diction. So many triumphs opened at length the doors of the academy to our author, and he succeeded to Colardeau.

Not to interrupt the history of our author's academic success, we have forborne till now to speak of his tragedies. Long before he had obtained so many honors, he had made himself known by a tragedy entitled Warwick, which was represented before he was twenty-four years of age, and gave proofs of distinguished talents. Ilis other pieces, though written with much art, and finely conceived, are far from having that original and bold color belonging to the former. Coriolanus is a character consonant to our author's feelings; and Philoctetes offered to him another of the same kind. The other tragedies of M. de la Harpe are inferior to those we have noticed; yet they are read with plcasure, being written in an elegant style, and possessing that sweetness which results from a due observance of the rules of composition.

We now quit the poetical productions of M. de la Harpe, to consider another great feature of his literary character. ' Let us suppose him stripped,' says M. Gaillard, ' of his other works, his tragedies, his poetry of various kinds, his academical discourses; let him no longer be deemed a poet or orator; let us now view alone the critic :-- How great will the space be, how splendid the fame he will yet enjoy in literature ! How has he graced and ennobled that function of journalist, which so many before and after him have degraded !' The correspondence of M. de la Harpe with the grand duke of Russia gives a just and animated picture of the authors who fiourished at the period of the correspondence. It abounds with curious details respecting their works, talents, and manners; and contains a variety of anecdotes of literature, and of the arts and sciences. We are now come to the work which places the seal on the literary reputation of M. de la Harpe, his Cours de Litterature, Ancienne et Moderne, which justly entitles him, in the beginning of the nineteenth century, to the honorable apellation of the French Quintilian.

After the first crash of the revolutionary earthquake had overturned the ancient monarchy of France, and thrown up in its stead but the tyranny of Robespierre, M. de la Harpe attempted to expose to his deluded countrymen the miserable state to which they were reduced. His efforts were, however, unsuccessful: but they procured for himself a dungeon. He had, however, the happiness to be forgotten in his confinement, from which he was liberated shortly after the 9th Thermidor. He re-appeared at the Lyceum, where it was observed that misfortune had added new energy to his eloquence; and it was in the midst of a numerous audience that he boldly and ingenuously renounced his errors! A new storm arose, and M. de la Harpe was driven to seek an asylum in a spot impenetrable to all but a faithful friendship. He was deprived of exercise; and the effect on his health was perceptible when he again appeared in public. His health henceforth sensibly declined, and he expired Novemoer, An 11. On the evening preceding his death M. Fontanes called to see him: he was listening to the prayers for the sick; and, as soon as they were concluded, he stretched forth his hand to M. Fontanes, and said, ' I am grateful to divine mercy for having left me sufficient recollection to feel how consoling these prayers are to the dying."

HARPE, in mythology, a crooked sword wherewith Mercury cut off Argus's head, and Perseus that of Medusa.

that of Medusa. HARP'ING-IRON, n. s. HARPOON' n. s. HARPOON' ER, n. s. Which whales are struck and caught : one who throws the harpoon.

HARPINGS, *n. s.* the fore parts of the wales which encompass the bow of a ship, and are fastened to the stem, being thicker than the after part of the wales, in order to strengthen the ship

HARPOCRATES, in mythology, the son of Isis and Osiris; an Egyptian deity, represented with his fingers applied to his mouth, denoting that he is the god of silence. His statue was fixed in the entrance of most of the Egyptian temples, and he was commonly exhibited under the figure of a young man naked, crowned with an Egyptian mitre, holding in one hand a cornucopia, and in the other the flower of lotus, and sometimes bearing a quiver.

HARPOCRATION (Valerius), a celebrated ancient rhetorician of Alexandria, who wrote an excellent Lexicon of the ten orators of Greece. Aldus first published this lexicon in Greek at Venice in 1603. Many learned men have labored upon it; but the best edition was given by James Gronovius at Leyden in 1696.

HARPONULLY, or HARPONHELLY, a district of South Hindostan, bounded on the north by the Toombuddra River, and situated in about the fifteenth degree of north latitude. It is not so hilly as adjacent districts, but there are some strong positions, the principal of which is Oochinadroog. The villages are numerous and well populated.

In 1774 this territory was conquered by Hyder, and added to his dominions. In 1786 Tippoo completely subdued it, and sent the rajah prisoner to Seringapatam; on the fall of which the heir took possession of Harponully, which is now tributary to the East India Company. The rights of the Nizam to this district were ceded to the Company in 1800. It has since much improved, and now forms part of the Bellary collectorship under the Madras presidency.

HARPONULLY, the capital of the above district, is 170 miles north by west from Seringapatam.

The HARPOON, or HARPING IRON, is a spear or javelin used to strike the whales in the Greenland fishery. It is furnished with a long staff, having at one end a broad and flat triangular head, sharpened at both edges, so as to penetrate the whale with facility : to the head of this weapon is fastened a long cord, called the whale line, which lies carefully coiled in the boat, in such a manner as to run out without being interrupted or entangled. See WHALE-FISHERY. The gun harpoon is a kind of firearm for discharging harpoons at whales, and thereby killing them more easily and expe-ditiously than formerly, when the harpoons were thrown by the hand. In the Transactions of the Society for Encouraging Arts for 1786, we have an account of the first fish struck in this manner in 1784. The gun was of the blunderbuss construction, loaded with four common tobacco pipes full of glazed powder; the fish was shot at the distance of ten fathoms, the harpoon going into her back up to the ring; and she was killed in about an hour. In 1785 three whales were killed in this manner; four in 1786, and three in 1787. In the Philosophical Transactions for 1789 we have accounts of a number of whales killed in this manner. The instrument appears to be

52

extremely useful in calm weather, as the whale, though a timorous creature, will frequently allow a boat to approach³ it within twenty, fifteen, or even ten fathoms, all of which distances are within reach of the gun harpoon, though not within reach of that thrown by the hand. It is now however seldom used; the continual damp of the northern regions often preventing the powder from firing, and the Greenlanders hating all innovations on their ancient customs.

HARPY, n. s. Lat. harpyia. The harpies were a kind of birds which had the faces of women, and foul long claws; very filthy creatures : figuratively, a ravenous wretch; an extortioner.

When fell Oppression in his harpy fangs,

From Want's weak grasp the last sad morsel bears, Can ye allay the heart-wrung parent's pangs,

Whose famished child craves help with fruitless tears? Beattie.

HARPYIÆ, the Harpies (APIIYIAI), in mythology, were a rapacious impure sort of monsters, with wings and ears like bears, bodies like vultures, faces like women, and feet and hands hocked like the talons of birds of prey. The ancients believed the harpies to be genii or demons. Some make them the daughters of Oceanus and Terra; whence Servius says, that they inhabited an island, half on land, and half in water. Valerius Flaccus makes them the daughters of Typhon. There were three harpics, Aëllo, Ocypete, and Celœno, which last Homer calls Podarge. Hesiod in his Theogony, ver. 267, only reckons two, Aëllo and Ocypete, and makes them the daughters of Thaumas and Electra, affirming that they had wings, and went with the rapidity of the wind. Pherecydes relates, that the Boreades expelled them from the Ægean and Sicilian Seas, and pursued them as far as the islands which he calls Plotæ, and Homer Calynæ; since called Strophades. Vos-sius (De Idolo, lib. iii. cap. 99, p. 63), thinks that the ancients, by the harpies, could mean nothing else but the winds; and that it was on this account they were made daughters of Electra, the daughter of Oceanus. Such is the opinion of the scholiasts of Apollonius, Hesiod, and Eustathius. Mr. Bryant supposes that they were priests in Bithynia, who, on account of their repeated acts of violence and cruelty, were driven out of the country; their temple was called Arpi, and the environs Arpiai, and he observes that Harpya, $A\rho\pi via$, was of old the name of a place."

HAR'QUEBUSS, n. s. } Ital. archibuso. A HARQUEBUSSIER', n. s. } hand-gun: one armed with a harquebuss.

Twenty thousand nimble harquebussiers were ranged in length, and but five in a rank. Knolles.

A HARQUEDUSS is of the length of a musket, usually cocked with a wheel. It carries a ball weighing $1\frac{1}{4}$ oz. There was also a larger sort, called the great harquebuss, used for the defence of strong places, which carried a ball of about $3\frac{1}{2}$ ozs. They are now little used except in some old castles and garrisons.

HARRADI. See HARADI.

HARRIDAN, n. s. Corrupted from haridelle, a worn-out worthless horse. A decayed strumpet.

53

She just endured the winter she began, And in four months a battered harridan.

Swift.

HARRINGTON (James), an eminent English writer in the seventeenth century. He was born at Upton and educated at Oxford; and, after travelling for some years on the continent, he was admitted one of the privy chamber ex-traordinary to Charles I. Though democratic in his principles, he served the king with great fidelity, and found means to attend him on the scaffold, when he received a token of his majesty's affection. After the death of king Charles, he wrote his Oceana; a kind of political romance, in imitation of Plato's Commonwealth. which he dedicated to Oliver Cromwell. It is said, that when Oliver perused it, he declared that ' the gentleman had written very well, but must not think to cheat him out of his power and authority; for that what he had won by the sword, he would not suffer himself to be scribbled out of.' This work was attacked by several writers, against whom he defended it. Besides writing to promote republican principles, he instituted a nightly club in the New Palace-Yard, Westminster; which was called the Rota, and continued till the secluded members of parliament were restored by general Monk. In 1661 he was committed to the Tower for treasonable practices, but the charge was never verified. He was conveyed to St. Nicholas's Island, and thence to Plymouth, where he fell into frenzy, owing, it is said, to having drunk great quantities of guaiacum. Having obtained his liberty by means of the earl of Bath, he was carried to London and died in 1677. He published several other works, which were first collected by Toland, in 1 vol. folio, in 1700; but a more complete edition was published in 1737, by the Rev. Dr. Birch.

HARRINGTON (Sir John), an ingenious English poet, the son of John Harrington, esq., who was committed to the Tower by queen Mary, for holding a correspondence with her sister Elizabeth; who, when she came to the crown, stood sponsor to this son, and afterwards knighted him. Before he was thirty, he published a translation of Ariosto's Orlando Furioso. A collection of his works has been printed, entitled Nugæ Antiquæ. He was created a knight of the Bath by James I., and in 1603 a baron, by the title of lord Harrington. He attended the princess Elizabeth, after her marriage with the elector palatine, to Heidelburg, in April, 1613, and died at Worms, August the 24th, 1613, aged fifty-one.

HARRIOT (Thomas), an eminent algebraist, born at Oxford in 1560, where he took the degree of B. A. in 1579. Being distinguished for his mathematical learning, he was recommended to Sir Walter Raleigh, who, in 1585, sent him with the colony, under Sir Richard Grenville, to Virginia. After having remained there about a year, he published a topographical description of it. About 1588 he was introduced by his patron, Sir Walter Raleigh, to Henry earl of Northumberland, who allowed him a pension of £120 per annum. He spent many years in Sion College; where he died in July 1621, of a can-

cer in his lip, and was buried in the church of St. Christopher, where a handsome monument was erected to his memory. He was one of the first mathematicians of the age in which he lived, and will always be remembered as the inventor of the present improved method of algebraical calculation; which was adopted by Des Cartes, and for a considerable time imposed upon the French nation as his own invention; but the theft was at last detected by Dr. Wallis, in his History of Algebra, where our author's invention is accurately specified. His works are, 1. A blief and true Report of the New found Land of Virginia; of the commodities there found, and to be raised, &c. 2. Artis analyticæ praxis ad æquationes algebraicas nova expedita, et generali methodo resolvendas, e posthumis Thomæ Harrioti, &c. 3. Ephemeris Chyrometrica; MS. in the library of Sion College. He left several other MSS., which were inspected by Dr. Zach, astronomer to the duke of Saxe Gotha, in 1784, at Petworth, in Sussex, the seat of the earl of Evremont, a descendant of Henry earl of Northumberland. Dr. Zach published an account of them in the Astronomical Ephemeris for 1788 : from which it appears that Harriot had made great discoveries in astronomy; particularly that he had observed the spots in the sun so early as December the 8th, 1610; which was eighteen months earlier than Galileo's first published observations respecting them; and that he had also discovered the satellites of Jupiter, and made drawings of their positions, and calculations of their revolutions, in January 1610, the same month when Galileo discovered them. Dr. Zach adds, that Harriot's observations of the comet of 1607 are still of use. The following was the inscription upon his monument :-

Siste, Viator, leviter preme. Jacet hic juxta quod mortale fuit C. V. THOMÆ HARRIOTI. Hic fuit doctissimus ille Harriotus De Syon ad flumen Thamesin, Patrià et Educatione Oxoniensis. Qui omues scientias calluit, et in omnibus excelluit;

Mathematicis, Philosophicis, Theologicis. Veritatis Indagator Studiosissimus. Dei Triniunius cultor piissimus. Sexagenarius aut eò circiter Morialitati valedixit, non Vitæ, An. Christi MDCXXI. 2. Julij.

11ARRIS (William), a protestant dissenting minister of eminent abilities, who resided at Honiton, in Devonshire. On September the 20th, 1765, the degree of D. D. was unanimously conferred on him by the university of Glasgow. He published an Historical and Critical Account of the Lives of James I., Charles I., and Oliver Cromwell, in 5 vols. 8vo. after the manner of Bayle. He was preparing a similar account of James II. He also wrote the life of Hugh Peters; besides many fugitive pieces occasionally, for the public prints, in support of liberty and virtue. Dr. Harris died at Honiton, February the 4th, 1770.

HARRIS (John), as the first compiler of a dic-

tionary of arts and sciences, in this country, certainly deserves notice in an encyclopædia. He was born about the year 1670, and received his education at St. John's College, in the university of Cambridge, where he took the degree of B. A. in 1687, and that of M. A. in 1691. Having taken orders in the church, he obtained considerable preferments. He was first instituted into the rectory of Barming, which he resigned for St. Mildred, Bread Street, London; he held also the perpetual curacy of Stroud, near Rochester, in Kent, and he was prebendary of Rochester cathedral. He was a fellow, secretary, and vice-president to the Royal Society. In 1698 he preached the course of Boyle's Lectures, which was published; and in the next year he took the degree of D. D. Dr. Harris also published several single sermons; and a Collection of Voyages and Travels, with a number of Engravings; a Treatise on the Theory of the Earth, in 1697; a Treatise on Algebra, in 1702; a translation of Pardie's Geometry into English, a seventh edition of which in 12mo. was printed in 1734; Astronomical Dialogues, the third edition of which appeared in 1795; but the work for which he was most eminently distinguished was his Lexicon Technicum, or A Universal Dictionary of Arts and Sciences, in 2 vols. folio, published in 1708; from which originated all the other dictionaries of science and cyclopædias that have since appeared. He died September the 7th, 1719, leaving unfinished the History of Kent, which was published in folio very soon after his death.

HARRIS (James), a writer on philology, was born at Salisbury in 1709, and was nephew to Shaftesbury the author of the Characteristics. Having entered as a gentleman commoner of Wadham College, Oxford, at the age of sixteen, he afterwards became a probationer at Lincoln's On the death of his father, at the age of Inn. twenty-three, he came into possession of an independent fortune, and retired to his native place to dedicate his time to literature. In 1744 he published a volume containing Essays on Art, on Music and Painting, and on Happiness; a prelude to his Hermes, or a Philosophical Enquiry concerning Universal Grammar, displaying much ingenuity, and an extensive acquaintance with the Greek writers, both poets and philosophers; but his ignorance of the northern dialects is very conspicuous. See our article GRAMMAR. In 1761 he was chosen M. P. for the borough of Christ Church; and next year was appointed one of the lords of the admiralty, which office he exchanged in 1763 for that of a lord of the treasury. He returned to the ministry in 1765; but was made secretary and comptroller to the queen in 1774. His philological Enquiries was a posthumous work. He died in 1780.

HARRIS (Gael Na Heradh, or Hardubb, i. e. the heights), a peninsula and parish of Scotland, in Invernesshire, forty-eight miles long, and from six to twenty-four broad; consisting of seven large inhabited islands, viz. Berneray, Pabby, Calligray and Ensay, on the south; and Taransay, Scalpay and Scarp on the north; besides the peninsula, and above thirty smaller isles uninhabited. Of these islands some produce good crops of oats, barley, and potatoes, and all of them pasture; but the soil in general is poor, and the greater part not arable. The population in 1793, stated by the Rev. John M'Leod, in his report to Sir J. Sinclair, was 2536. The number of sheep (which range unheeded through the mountains and commons), was about 11,000; that of goats 250; of horses 1000; of black cattle 2460; and of deer 800. All these animals are small in size; but the beef and mutton are delicious, and the wool is extremely fine. About 350 persons are employed in making from 400 to 500 tons of kelp annually. The population has rapidly increased of late.

HARRIS, the peninsula of the Hebrides in the above parish, forming with Lewis one of the Western Islands of Scotland. See LEWIS. Harris is twenty miles long and ten broad. Upon the east side it is mostly rock; but on the west there are some tolerable farms, and the number of people amounts to 2000. It has Lewis on the north, and North Uist on the south, from which it is separated by the sound. Harris abounds on the east side in excellent bays, and fishery.

HARRIS, SOUND OF, a navigable channel, between a peninsula of the Hebrides bearing the same name and North Uist, nine miles broad, and nine long. It is the only passage, between the Butt of Lewis and Barra, for vessels of burden passing to and from the west side of Long Island. It requires a skilful pilot, being greatly encumbered with rocks and islands. The fish on this coast are more numerous, and of larger dimensions, than those of the opposite continent; on which account two royal fishing stations were begun in the reign of Charles I., one in Loch Maddie, and the other in the Sound of Harris. A phenomenon is remarked by the Rev. Mr. M'Leod, in the tides of this Sound :- ' From the autumnal to the vernal equinox, the current in neap tides passes all day from east to west, and all night in the contrary direction. Immediately after the vernal equinox it changes this course, going all day from west to east, and the contrary at night. In spring tides the current corresponds nearly to the common course.

HARRISBURGH, the present metropolis of Pennsylvania, United States, in Dauphin county, is on the north-east bank of the Susquehanna ; sixteen miles east of Carlisle, thirty-six W.N.W. of Lancaster, ninety-eight west of Philadelphia. It contains a court-house, a jail, two market houses, a bank, and three houses of public worship; one for Lutherans, one for Presbyterians, and one for German Presbyterians. It is very pleasantly situated, regularly laid out, a great part of the houses are handsomely built of brick, and the town makes a very fine appearance. Two wings of a state house have been erected on a delightful elevation at a little distance from the river. Here is a very elegant covered bridge across the Susquehanna.

HARRISON (John), one of the regicide judges who sat upon the trial of king Charles I.,

and one of the ten who were executed for that act, after the Restoration. See ENGLAND. He was the son of a butcher, and had been raised to the rank of colonel, and afterwards of general, in the army of the parliament. Dr. Goldsmith gives the following account of his behaviour at his trial and execution :--- 'General Harrison, who was first brought to his trial, pleaded his cause with that undaunted firmness which he had shown What he had done, he said, was through life. from the impulse of the Spirit of God. He would not, for any benefit to himself, hurt a hair of the poorest man or woman upon earth; and during the usurpation of Cromwell, when all acknowledged his right, or bowed down to his power, he had boldly upbraided the usurper to his face; and all the terrors of imprisonment, and allurements of ambition, had not been able to bend him to a compliance to that deceitful ty-Harrison's death was marked with the rant. same admirable constancy which he showed at his trial.-Some circumstances of scandalous barbarity attended the execution. Harrison's entrails were torn out and thrown into the fire. before he expired. His head was fixed on the sledge that drew Coke and Peters to the place of execution, with the face turned towards them.'

HARRISON (John), the inventor of the celebrated time-keeper for ascertaining the longitude at sea; and also of the compound, or, as it is commonly called, the gridiron pendulum; was born at Foulby, near Pontefract, in Yorkshire, in 1693. The vigor of his natural abilities, if not strengthened by want of education, which confined his attention to few objects, at least amply compensated for it; as appeared from the astonishing progress he made in that branch of mechanics to which he devoted himself. His father was a carpenter, and occasionally sarveyed land, and repaired clocks and watches. In 1700 he removed to Barrow, in Lincolnshire; where the son eagerly improved every incident from which he might collect information; frequently employing great part of his nights in writing or drawing: and he always acknowledged his obligations to a clergyman who lent him a MS. copy of professor Saunderson's Lectures; which he carefully transcribed, with all the diagrams. In 1726 he had constructed two clocks, mostly of wood, in which he applied the escapement and compound pendulum of his own invention : these surpassed every thing then made, scarcely erring a second in a month. In 1728 he came up to London with the drawings of a machine for determining the longitude at sea, in expectation of being enabled to execute one by the Board of Longitude. Upon application to Dr. Halley he referred him to Mr. George Graham; who advised him to make his machine before he applied to the board. He returned home to perform this task; and in 1735 came to London with his first machine, with which he was sent to Lisbon the next year, for trial. In this short voyage he corrected the dead reckoning about a degree and a half; which success procured him both public and private encouragement. About 1739 he completed his second machine, of a construction much more simple than the former, and which

answered much better : this, though not sent to sea, recommended him still more to patronage. His third machine, in 1749, was still less complicated than the second, and superior in accuracy, erring only three or four seconds in a week. This he conceived to be the ne plus ultra of his attempts; but, in an endeavour to improve pocket watches, the principles he applied surpassed his expectations so much as to encourage him to make his fourth time-keeper, which is in the form of a pocket watch, about six inches in diameter. With this time-keeper his son made two voyages; the one to Jamaica, and the other to Barbadoes: in both which experiments it corrected the longitude within the nearest limits required by the act of the 12th of queen Anne ; and the inventor therefore, at different times, though not without great trouble, received the proposed reward of £20,000. These four machines were given up to the board of longitude. The three former were now of no use, as all their advantages were comprehended in the last; they were worthy, however, of being carefully preserved as mechanical curiosities, in which might be traced the gradations of ingenuity executed with the most delicate workmanship. They are kept in the royal observatory at Greenwich. The fourth machine, emphatically called the timekeeper, was copied by the ingenious Mr. Kendal; and that duplicate, during a three years' circumnavigation of the globe in the southern hemisphere by captain Cook, answered as well as the original. The latter part of Mr. Harrison's life was employed in making a fifth improved timekeeper on the same principles with the preceding one; which at the end of a ten weeks' trial, in 1772, at the king's private observatory at Richmond, erred only four seconds and a half. Within a few years of his death he had frequent fits of the gout, a disorder that never attacked him before his seventy-seventh year: he died at his house in Red Lion Square in 1776, aged eightythree. His recluse manner of life, in the unremitted pursuit of his favorite object, was not calculated to qualify him as a man of the world; and the many discouragements he encountered, in soliciting the legal reward of his labors, still less disposed him to accommodate himself to the humors of mankind. In conversing on his profession he was clear, distinct, and modest; but found a difficulty in explaining his meaning by writing; in which he adhered to a peculiar and uncouth phraseology. This was evident in his Description concerning such Mechanism as will afford a nice or true Mensuration of Time, &c., 8vo., 1775; in which he obstinately refused to accept of any assistance whatever. This work contains also an account of his new musical scale, or mechanical division of the octave, according to the proportion which the radius and diameter of a circle have respectively to the circumference. He had in his youth been the leader of a distinguished band of church singers; had a very delicate ear for music; and his experiments on sound, with a most curious monochord of his own improvement, are reported to have been no less accurate than those in which he was engaged for the mensuration of time.

HARRISON (William), a writer much patronised by the literati of his time. He was fellow of New College, Oxford; and was some time tutor to the duke of Queensberry's son. Dr. Swift, by his interest with Mr. St. John, obtained for him the employment of secretary to lord Raby, ambassador at the Hague, and afterwards earl of Strafford. A letter of his, dated Utrecht, December 16th 1712, is printed in the dean's works. Mr. Harrison did not long enjoy his rising fortune. He was sent to London with the Barrier treaty, and died February 14th, 1712-13. Dr. Swift laments his loss in his Journal to Stella. Mr. Tickel mentions him with respect in his Prospect of Peace; and Dr. Young, in the close of an epistle to lord Lansdowne, bewails his loss. Dr. Birch, who has given a curious note on Harrison's Letter to Swift, has confounded him with Thomas Harrison, M. A., of Queen's College. In Nichols's select Collection are some pleasing specimens of his poetry; which, with Woodstock Park, in Dodsley's Collection, and an Ode to the Duke of Marlborough 1707, in Duncombe's Horace, are all the poeti-cal writings that are known of this young man; who figured both as a humorist and a politician in the fifth volume of the Tatler, of which (under the patronage of Bolingbroke, Henley, and Swift) he was professedly the editor.

HARRISON, a county of the state of Ohio, United States, bounded on the south by Belmont, east by Jefferson, north by Columbia and Stark, and west by Tuscarawa. Its surface is hilly, and abounds with coal mines, freestone, limestone, and a fine white soft tenacious clay. It is watered by the Stillwater, and other branches of the Tuscarawa, and by the creeks running into the Ohio.

HARRISON, a county of the United States, in Kentucky. Cyntheana is the chief town.

HARRISON, a county of the state of Indiana, in the United States, bounded east by Clark county, south by the Ohio, west by the new county of Perry, and north by Washington. HARRISON, a county of the United States, in

HARRISON, a county of the United States, in the western part of Virginia, bounded north by Ohio county, north-east by Monongalia, south by Greenbriar, and south-west by Kenhaway. It is about 120 miles in length, and eighty in breadth. The chief town is Clarksburg.

HARROGATE, or HARROWGATE, a village in the West Riding of Yorkshire, in the parish of Knaresborough, remarkable for three medicinal springs, all different in their qualities, notwithstanding their vicinity: viz. 1. The Tewet Water, or Sweet Spa, a vitriolic spring of a sort of milky taste, discovered by Mr. Slingsby in 1638. 2. The Sulphur Spring, useful in dropsical, scorbutic, and gouty cases. It rises in the town, and is received in four basins under four different buildings: at one it is drunk; at the others used for bot or cold baths. It is perfectly clear, and very salt; but the taste and smell resemble those of a mixture of rotten eggs, sulphur, and sea-water. Bathing is the most general mode of using it. It is the strongest sulphurwater in Great Britain; and does not lose the sulphureous smell even when exposed to almost a boiling heat. In distilling it, when three pints 57

had been taken off from a gallon of it, the last was as strong as the first. It is discutient and attenuating, and a warm bath of it is of great benefit in pains, strains and lameness; dissolving hard swellings, curing old ulcers and scrofulous complaints, and cleansing the stomach and bowels. 3. St. Mungo's Well, is so called from St. Mungo or St. Kentigern, a Scotch saint. See KENTIGERN. Harrogate lies three miles west of Knaresborough, and 208 north of London.

HAR'ROW, n. s., v. a. & HAR'ROWER, n. s. [inlcrj.] Fr. charrue, hercer; German, harcke, a HAR'RY, v. a. timbers crossing each other, and set with teeth, drawn over sowed ground to break the clods, and throw the earth over the seed. The verb is often used in a figurative sense to pillage; strip; lay waste ; to invade ; to disturb, or put in commotion, as with a dreadful tale. Harrow, the interjection, is an exclamation of distress and now out of use. Harry, in Scotland, signifies to rob; plunder; or oppress; as, one harried a nest; that is, he took the young away: as also, he harried me out of house and home; that is, he robbed me of my goods, and turned me out of doors.

Canst thou bind the unicorn with his band in the furrow? or will he harrow the valleys after thee? Job.

And, when the mele is sacked and ybound, This John goth out, and fint his horse away, And gan to crie: Harrow and wala wa ! Our hors is lost. Chaucer. The Reves Tale. They crieden, Out harrow and wala wa.

Id. The Nonnes Preestes Tale.

Friend, harrow in time, by some manner of means, Not only thy person, but also thy beans. Tusser.

Most glorious Lord of life, that on this day

Did'st make thy triumph over death and sin ; And having harrowed hell, didst bring away

Captivity thence captive, us to win. Spenser.

And, he that harrowed hell with heavy stowre, The faulty souls from thence brought to his heavenly

howre. Id. Faerie Queene.

Harrow now out and weal away, he cried ; What dismal day hath sent this cursed light, To see my lord so deadly damnifyed? Spenser.

I could a tale unfold, whose lightest word Would harrow up thy soul, freeze thy young blood, Make thy two eyes, like stars, start from their spheres. Shakspeare.

Thou must not take my former sharpness ill. -I repent me much Id.

That I so harry'd him.

Let the Volscians

Plow Rome, and harrow Italy. Id. Most like : it harrows me with fear and wonder. Id.

As the king did excel in good commonwealth laws, so he had in secret a design to make use of them, as well for collecting of treasure as for correcting of manners; and so meaning thereby to harrow his people, did accumulate them the rather. Bacon.

Amazed I stood, harrowed with grief and care.

Milton. The land with daily care

Is exercised, and with an iron war

Dryden. Of rakes and harrows.

Two small harrows, that clap on each side of the Mortimer. ridge, harrow it right up and down.

Imagine you behold me bound and scourged, My aged muscles harrowed up with whips ; Or hear me groaning on the rending rack. Rowe.

HARROW ON THE HILL, a town of Middlesex, with a church and lofty spire, seated on the top of the highest hill in the county, ten miles W.N.W. of London. It is noted for a free school, founded in the reign of queen Elizabeth.

HARSH, adj. HARSH'ALY, adv. HARSH'NESS, n. s. Germ. hervische.—Skin-ner. Rough or rugged; grating to the ear; dis-

cordant: figuratively, severe; crabbed; morose: violence, as opposed to gentleness,

My wife is in a wayward mood to-day,

I tell you, 'twould sound harshly in her ears. Shakspeare.

Get from him why he puts on this confusion, Grating so harshly all his days of quiet

With turbulent and dangerous lunacy.

A name unmusical to Volscian ears,

And harsh in sound to thine.

Take an apple and roll it upon a table hard : the rolling doth soften and sweeten the fruit, which is nothing but the smooth distribution of the spirits into the parts ; for the unequal distribution of the spirits Bacon. maketh the harshness.

He was a wise man and an eloquent; but in his nature harsh and haughty. Id.

Harshness and ruggedness of bodies is unpleasant Id. to the touch.

Bear patiently the harsh words of thy enemies, as knowing that the anger of an enemy admonishes us Taylor. of our duty.

Our nature here is not unlike our winc ;

Some sorts, when old, continue brisk and fine :

So age's gravity may seem severe,

But nothing harsh or bitter ought t' appear.

Denham.

'Till like ripe fruit thou drop

Into thy mother's lap; or be with ease Gathered, not harshly plucked. Milton.

Black feels as if you were feeling needles points, or some harsh sand ; and red feels very smooth.

Boule.

Id.

Id.

Neither can the natural harshness of the French, or the perpetual ill accent, be ever refined into perfect harmony like the Italian. Dryden.

Cannot I admire the height of Milton's invention, and the strength of his expressions, without defending his antiquated words, and the perpetual harshness of their sound?

Age might, what nature never gives the young, Have taught the smoothness of thy native tongue ; But satire needs not that, and wit will shine Through the harsh cadence of a rugged line. Id.

The unnecessary consonants made their spelling tedious, and their pronunciation harsh. Id.

Thy lord commands thee now

With a harsh voice, and supercilious brow, Id. To servile duties.

With eloquence innate his tongue was armed; Though harsh the precept, yet the preacher charmed. Id.

The rings of iron that on the doors were hung, Id. Sent out a jarring sound, and harshly rung.

Thy tender hefted nature shall not give Thee o'er to harshness : her eyes are fierce, but thine Id. Do comfort and not burn.

Sweet, bitter, sour, harsh, and salt, are all the epithets we have to denominate that numberless variety Locke. of relishes.

I would rather he was a man of a rough temper, that would treat me harshly, than of an effeminate nature. Addison.

No harsh reflection let remembrance raise ;

Forbear to mention what thou can'st not praise. Prior.

Tho' Fortune yield the captive ne'er despair,

But seek the constable's considerate ear ;

He will reverse the watchman's harsh decree,

Gay. Moved by the rhetoric of a silver fee. A certain quickness of apprehension inclined him

to kindle into the first motions of anger; but, for a long time before he died, no one heard an intemperate or harsh word proceed from him. Atterbury.

'Tis not enough no harshness gives offeuce :

The sound must seem an echo to the sense. Pope. The same defect of heat which gives a fierceness to our natures, may contribute to that roughness of our language, which bears some analogy to the harsh fruit of colder couptries. Swift.

Whose delegated cruelty surpasses

The worst acts of one energetic master,

However harsh and hard in his own bearing. Byron.

HART, n.s. HARTS'HORN, n. s. HART'ROYAL, n. S. HARTS'TONGUE, n. s. HART'WORT, n.s.

Sax. peopr. A hedeer; the male of the roe. Hartshorn, the name of a drug; an herb. The others are

plants.

And to the launde he rideth him full right, Ther wos the hart ywont to have his flight ;-And over a brook and soforth on his way And this duk wol have a couxs at him or twey With houndes, swiche as him lust to commaunde. Chaucer. The Knightes Tale.

That instant was I turned into a hart, And my desires, like fell and cruel hounds, E'er since pursue me, Shakspeare. The deer

And fearful harts do wander every where

Amidst the dogs. May's Virgil. Hartstongue is propagated by parting the roots, and also by seed. Mortimer.

Ramose concretions of the volatile salts are observable upon the glass of the receiver, whilst the spirits of wipers and hartshorn are drawn. Woodward.

Hartshorn is a drug that comes into use many ways, and under many forms. What is used here are the whole horus of the common male decr, which fall off every year. This species is the fallow-deer; but some tell us, that the medicinal hartshorn should be that of the true hart or stag. The salt of hartshorn is a great sudorifick, and the spirit has all the virtues of volatile alkalies : it is used to bring people out of faintings by its pungency, holding it under the nose, and pouring down some drops of it in water. Hill.

HART, a stag, or male deer, in the sixth year. See CERVUS.

HARTS, HORNS OF, the horns of the male deer. The scrapings or raspings of these are medicinal, and used in decoctions, ptisans, &c. The horns of harts yield by distillation a very penetrating volatile spirit called volatile alkali; which is also procured in equal perfection from the horns, bones, &c., of other animals. See ALKALI, CHE-MISTRY, and HARTSHORN.

HARTE (Walter), an English poet and divine, the son of a non-juring clergyman. He was born about 1697, and received his education at Marlborough, whence he was removed to St. Mary's Hall, Oxford, where he took his degree

of M.A. in 1720. In 1727 he published a volume of poems, dedicated to the earl of Peterborough. In the same year he also published his Essay on Satire; and in 1735 an Essay on Rea son, in which he was assisted by Pope. He subsequently became vice-principal of St. Mary's Hall; and was recommended by lord Lyttleton to the earl of Chesterfield, as a travelling and private preceptor to his natural son, with whom he made the tour of Europe, from 1746 to 1750. On his return the last nobleman procured him a canonry of Windsor. In 1759 he published his History of Gustavus Adolphus. His last work was a collection of poems entitled The Amaranth, which appeared in 1763. He died in 1774, at St. Austle in Cornwall, of which place he was vicar. Besides the above works, Mr. Harte was author of Essays on Husbandry.

HARTFORD, a county in the north part of Connecticut, United States. Population 44,733

HARTFORD, a city, the metropolis of Connecticut, in a county of the same name, United States, on the west bank of Connecticut River, fifty miles above its mouth; fourteen miles north of Middletown, thirty-four N.N.E. of Newhaven, forty-two north-west of New London, sixty-eight west of Providence, ninety-four southeast of Albany, 100 W.S.W. of Boston, and 338 of Washington. Population 3955; and including the township 6003. It is pleasantly situated, at the head of a sloop navigation, and contains a state-house, two market-houses, two banks, two insurance offices, a state arsenal, an academy, a library of 2500 volumes, and four houses of public worship; two for Congregationalists, one for Episcopalians, and one for Baptists. The state-house is a handsome edifice, built of brick and stone. One of the congregational meetinghouses is very large and elegant. A small stream, called Little River, divides the town into two parts, which are connected by a bridge. The city is a generally well built, and makes a handsome appearance. It is regularly laid out, the streets intersecting each other at right angles. It is situated in a pleasant and fertile tract of country, and is considerable both for its trade and manufactures.

Hartford contains three distilleries, a cotton manufactory, a woollen manufactory, and ten printing offices, from four of which are issued weekly newspapers. It has also extensive manufactures of coaches, saddlery, and brass work. The public offices of the state are kept here. The elections and spring sessions of the legislature are held at Hartford, and the autumn ses-sions at New-Haven. - Within the township there is a parish, called West Hartford, with another congregational meeting-house, three miles from the city.

On the 15th of April, 1817, an institution, styled the 'Connecticut Asylum, for the education of the Deaf and Dumb, was opened in this city with twenty-one pupils. The number of pupils in May, 1818, was forty-one; under the instruction of a principal and four assistants. The success of this benevolent institution has hitherto been highly gratifying to the friends of humanity, and the improvement of the pupils has equalled the most sanguine expectations of their friends. Each person applying for admission must not be under nine, or over thirty years of age; and no pupil is received for a less term than two years. The whole annual charge to each pupil, for board, washing, fuel, instruction, stationary, &c., is 200 dollars.

The asylum is under the management of ten directors, chosen annually, together with the directors for life. A president, and eight vicepresidents, who are also, ex officiis, directors, are chosen annually. The payment of 100 dollars constitutes a person a director for life, and of 200 dollars, a vice-president for life. The annual meeting of the society is held at Hartford on the first Saturday after the second Thursday in May. A house situated about half a mile west of the city has been recently purchased for the accommodation of the institution.

HARTFORD, EAST, a post-town of Hartford county, on the east side of the Connecticut, opposite Hartford, with which it is connected by an elegant bridge. Population 3240. A small river which flows through this town, into Connecticut, affords many fine mill seats. Here are five paper mills, several saw mills and fulling mills, two large establishments for the manufacture of powder, one manufactory of snuff, one cotton manufactory, two glass houses, and three houses of public worship; two for Congregationalists, and one for Methodists.

HARTFORD, a post-town of Washington county, New York, fifty-four miles N.N. E. of Albany. Population 2389. It is a wealthy town, and contains three houses of public worship; two for Baptists, and one for Congregationalists.

HARTLEPOOL, a sea-port town in Durham, seated on a promontory, and almost encompassed by the sea. It is an ancient corporation, governed by a mayor and aldermen, with other subordinate officers. In the reign of Edward III. it furnished five ships to the navy. It depends chiefly on the fishing trade; and its harbour is much frequented by colliers passing to and from Newcastle. It is twelve miles north of Stockton, and 258 west of London.

HARTLEY (David), an English physician, and metaphysical writer, was the son of a clergyman of Armley, near Leeds in Yorkshire, where he was born in 1705. At fifteen he was sent to Jesus College, Cambridge, of which he became a fellow; and was intended for the clerical profession, but, having doubts of the truth of the thirty-nine articles, he engaged in the study of medicine, and commenced practice as a physician at Newark in Nottinghamshire. Hence he removed to Bury in Suffolk, and subsequently to London. When Mrs. Stephens professed to have found out a specific for the stone, Dr. Hartley contributed greatly towards her obtaining the grant of £5000 from parliament for her discovery; and published Observations made on ten Persons, who have taken the Medicament of Mrs. Stephens, 8vo. He himself, after having taken as much of it as contained 200 lbs, weight of soap is said to have fallen a sacrifice to the disease for which it was recommended. Dr. Hartley spent the latter part of his life at Bath, and died there August 28th, 1757. His reputation as a philosopher depends on his work entitled Observations

on Man, his Frame, his Duty, and his Expectations, in two parts, 1749, 2 vols. 8vo. His doctrine of association has been published by Dr. Priestley in a detached form, under the title of the Theory of the Human Mind, 8vo.; and the second part of the Observations, relating to morals and religion, has been commented on by Pistorius, a German divine, whose remarks are included in the edition of Dr. Hartley's book published in 4to. 1791, and in 3 vols. 8vo.

HARTLEY (David), M. P., was a son of the foregoing. His opposition to the war with the American colonies led to his being appointed one of the plenipotentiaries to treat with Dr. Franklin for peace; and some of his letters on that occasion are published in the correspondence of that statesman. In the house of commons Hartley was one of the first promoters of the abolition of the slave trade. His scientific knowledge was also exhibited in many useful inventions, and particularly in a method of guarding buildings from fire. He died at Bath, December 19th, 1813, aged eighty-four. HARTMANN (John Adolphus), a tearned

HARTMANN (John Adolphus), a tearned divine and historian, born at Munster in 1680. After being a Jesuit for several years, he became a Calvinist at Cassel, in 1715; and soon after was made professor of philosophy and poetry, and in 1722 professor of history and eloquence, at Marpurg, where he died in 1744. The most esteemed of his works are—1. The State of the Sciences at Hesse; in German. 2. Historia Hassiaca, 3 vols. 3. Præcepta Eloquentiæ Rationalis, &c.

HARTSHORN, CALCINED, or coal of hartshorn, a very white earth, procured by calcining the horns of harts in a long continued and strong fire. This earth is employed in medicine as an absorbent; and, when levigated, is the basis of Sydenham's white decoction, which is commonly prescribed in dysenteries.

HARTSHORN JELLY is nutritive and strengthening, and is sometimes given in diarrhœas; but a decoction of burnt hartshorn in water is more frequently used for this purpose, and is called hartshorn drink.

HARTSHORN PLANTAIN. See PLANTAGO.

HARTSHORN, SALT and SPIRIT OF. See AL-KALI, and CHEMISTRY.

HÁRTSOEKER (Nicholas), a Dutch philosopher, horn at Gouda, in 1656. He received a liberal education from his father, who was a minister among the Remonstrants, and became so eminent in natural philosophy and mathematics, that Peter the Great invited him to Moscow; but he declined the honor. He became professor of philosophy at Heidelburg, and mathematician to the elector palatine. He wrote a course of Natural Philosophy, in 4to., with some other works; and died in 1725.

HARTY, ISLE OF, a small island on the southeastern extremity of the Isle of Sheppy, from which it is divided by a narrow channel, almost filled up. It is separated from Kent by the Swale, and is entirely pasture land, maintaining about 4000 sheep.

HARTZ, or HARZ, a mountain tract in the interior of Germany and south of Hanover, extending from the territory of Goslar to Harz-

gerode, in Anhalt. It is about seventy miles in length, and twenty in breadth, and is a part of the region called Sylva Hercynia by the ancients. Forests, consisting of one-third of hard and twothirds of soft timber, cover its surface : but of late years, great ravages have been committed among the resinous trees, by a coleopterous insect, which multiplies with amazing rapidity. The mines of the Hartz are still more valuable. See HANOVER. Its green, blue, and white vitriol are found in veins generally imbedded in grey-wade or clay-slate, of which the greater number of the rocks are composed. The population of this district is about 50,000; differently characterised in their manners by a primitive simplicity, and early marriages. Their children are beautifully fair, and soon able to assist their parents. Particular spots are under corn culture; but pasture and very good hay are the chief agricultural produce. The inhabitants are chiefly employed as miners. Their favorite enjoyment is in music; and their itinerant bards and minstrels are numerous. The Hartz is exempt both from taxes and from military service; but a tenth of the produce of the mines belongs to government. Those of iron are the most productive, and yield a revenue of about £115,000 sterling, made good by 'Undertakers of the mines.' The workmen are divided into companies, and commonly wear a sort of uniform of black and red; part of their wages are paid in kind. Gold and silver are coined here.

The district abounds in natural curiosities, of which the most interesting are the Scharzfeld and Baumann caverns; the former remarkable for its fossile bones, the latter for its stalactites, its harmonic column emitting a pleasant sound when struck by the drops of water that fall from the roof, and its extent consisting of fourteen successive vaults. Here the Man of the Mountains is seen either morning or evening, when the spectator at the top of the mountain happens to be placed in a right line between the sun and a cloud hovering in the atmosphere at a small distance, and is merely the magnified image of the spectator reflected from the cloud as from a mirror.

HA'RVEST, n. s. HAR'VEST-HOME, n. s. HAR'VEST-LORD, n. s. HAR'VESTER, n. s. HAR'VESTER, n. s. HAR'VESTAN, n. s. HAR'VESTAN, n. s. HAR'VESTAN, n. s.

HAR'VESTMAN, n. s.) et oogst, Augusti mensis. Mr. Thomson thinks from Sax. zeap, a year, and vest, vegetable food. The season of reaping and gathering corn; the song which the reapers sing at the feast made at the gathering in of the harvest. Harvest-lord, the head reaper. Harvester and harvestman, one who works at the harvest. Harvest is used figuratively for the opportunity of gathering treasure; the product of labor.

Grant harvest-lord more by a penny or two,

To call on his fellows the better to do. Tusser. As it ebbs, the seedsman

Upon the slime and ooze scatters his grain,

And shortly comes to harvest. Shakspeare. His wife I will use as the key of the cuckoldy rogue's coffer ; and there's my harvest-home.

Id. Merry Wives of Windsor.

From Ireland came I with my strength, And reap the harvest which that rascal sowed.

Shakspeare. Like to a harvest-man that's tasked to mow Or all, or lose his hire. Id.

Anon, his fruitfull showres, and pleasing dewes, Commixt with cheerfull rayes, he sendeth downe ;

And then the barren-earth her crop rcnewes, Which with harvests, hills, and vallies crowne.

G. Withers. When the father is too fondly kind,

Such seed he sows, such harvest shall he find. Dryden

At harvest-home, and on the shearing-day, When he should thanks to Pan and Pales pay.

Id.

Your hay it is mowed, and your corn is reaped; Your barns will be full, and your hovels heaped;

Come, my boys, come,

Come, my boys, come,

And merrily roar out harvest-home.

With harvest work he is worse than in spring. L'Estrange.

- Attempered suns arise

Sweet-beamed, and shedding oft through lucid clouds A pleasing calm, while broad and brown below, Extensive *harvests* hang the heavy head.

Thomson's Autumn.

HARVEST FLY, in zoology, a large four-winged fly of the cicada kind, very common in Italy, and erroneously supposed to be the grasshopper. See CICADA.

HARVESTING, in agriculture, the act of cutting down and securing different sorts of crops. There are various modes of effecting this kind of business: indeed peculiarities are found attached to almost every different county in the manner of executing it. But, in whatever mode the work of harvesting is managed, it is clear that, as bad weather must greatly affect the profits of the cultivator, especially where wheat-crops are concerned, it is proper that the farmer should be constantly on his guard to have a sufficient number of hands at work, in order that the most may be made of the fine season; for, without this, much loss must be systained, and the title of atternoon farmer will be applied to him.

With regard to the cutting of crops, it is necessary to observe, that most sorts of grain, except that of barley, should be cut or reaped before they become over-ripe. But, where barley is cut in an unripe condition, it is apt to shrivel. It is, however, a practice with some farmers to leave the corn standing such a length of time, that it is ripe enough to cut and carry, as they term it, or until the sheaves are capable of being carted home, on being bound up. This method can, however, only be pursued where the crops are quite clean and free from weeds.

In the Report of East Lothian, in Scotland, it is stated, that the harvesting with winter-sown wheat is sometimes earlier than for other kinds of grain, only excepting Dutch oats. Springwheat is later, and, unless in favourable seasons, is cut with other grains. It is, however, suggested, that there seems to be some diversity of opinion among the farmers of this district, concerning the marks of ripeness in wheat, or the exact degrees of it that are requisite to constitute a perfect sample: some assert that cutting quick or early is the surest mode of having the grain.

Id.

perfect; but others, on the contrary, are of opinion that it should be dead ripe; or, in other words, that the circulation in the straw, as well as the corn, should be over before it is cut down. It is probable that the truth is to be 'ound in the middle between these extremes.

It is advised that such wheat as is much infested with weeds should be cut three or even four days earlier than is usual, in order that the weeds may have time to wither before the corn becomes too ripe; for, if it should not be cut before the grains are fully ripe, it will be liable to sustain considerable injury by shedding, loss of color, and damage from rain, while it continues exposed for the purpose of the weeds being rendered dry. A single shower, or even a day's gentle rain, while it lies in swath, is, indeed, thought by some to be rather beneficial to the grain, by causing it to feel dry and slippery in the hand, and thresh out the better; but every possible care should at the same time be taken to guard against its being wetted too much in the field. When however, through any unavoidable accident, it is laid up in too moist a condition, though it may not take any great harm in the mow, it will sweat and adhere together after being laid in a heap, when threshed out, and have a perfectly white appearance from mouldiness, as if dredged over with flour. As corn, in this state, is not capable of being kept, it should constantly be sent to the market, and disposed of as soon as possible.

It is the practice in most parts of the kingdom to cut the rye and wheat crops with the sickle or reaping-hook, a tool which would appear to have been employed for the purpose from the most early periods of the art of husbandry. But, in some cases, this tool is employed in a toothed state, while in others it has simply a cutting edge. The work is commonly done equally well which ever is made use of for the purpose. The business of reaping is performed differently, in respect to height and other circumstances, according as the custom of the district may prevail. It is usual in some of the midland counties, and in many of those on the south-east coast, to cut the wheat crops at the height of twelve or fifteen, and sometimes eighteen inches from the ground; the handfuls, as they are reaped, being laid on bands formed from some of the reeds of the crop twisted or knotted together near to the ear part. These different parcels, being bound up into what are termed sheaves, are either suffered to lie upon the stubble for a few days previously to their being carried, or they are set up on their bottoms in double rows, the head of the one sheaf inclining against that of the other opposite to it, so as to form a sort of irregular triangle if the base be included. But in some other cases the sheaves are set up into a kind of stool without being hooded. In most of these cases, as soon as the crop is carted off the land, the stubble is mown by means of a scythe, and, after being raked into large heaps, is conveyed away to the farm-yard, where it is used, either for thatching buildings, and corn and hay ricks, or as litter for the stock.

In almost the whole of the southern parts of the country, the crops of both oats and barley, as well as of peas and beans, are mown by means of a stiff sort of scythe, and either repeatedly turned over in the swaths, or formed into small cocks, in which states they continue until they are ready for being conveyed to the barns or stackyards. As soon as they are in this condition, the carts or waggons are set to work, and the whole of the hands that can be spared employed in raking the ground after them. In short, the business is managed pretty nearly in the same manner as that in which hay-making is performed The mowing and harvesting grain in swath or in cocks, if practices that can in any climate or situation be admitted as beneficial, can only, it is imagined, be considered so where the harvests are early, and where the climate is extremely mild, favorable, and steady. This being the case, it is not probable that such methods can ever become generally established in this country. For it is believed, that the henefits derived from harvesting the above different sorts of crops in the sheaf are extremely numerous, in comparison to those of the practices that have been just noticed.

It has been suggested, by an old writer, that it is material in hilly districts not to bind the grips of wheat into sheaves, at too early a period in th course of the day, as in such situations they have taken such a damp by having lain upon the surface of the ground, that though the straw and chaffy ears may appear dry as soon as the dew is first discipated, and the sun has shone a few hours upon them, there will still remain an inward dampness in the straw and grain, which will be injurious in the stack or mow. The afternoon should of course be chosen for the purpose of gripping and binding the grain into sheaves in such places, the work being finished before the approach of night. It is best, however, to lay the bands in the morning, as they will then twist better and be less brittle than after the sun has shone some time on the corn. They should always be made strong and well twisted together, in order that they may contain the corn without giving way. But though the modes advised above may be practised with propriety in some instances, and for some kinds of corn, they should not be much employed for wheat crops, as it is found that the less they are exposed to wet and heat the better. On this principle, the practice of covering the shocks of wheat, with cloths and mats, is in use in some places in the county of Kent, as between Sandwich and Dover. The mats are found the best, and are the most commonly employed. By this means it is supposed that the sample of the grain is so much improved, that the bakers at Dover give a decided preference to such as is treated in this manner. The expense of mats for this use is about sevenpence each, which, if properly taken care of, will last many years.

In places where the harvests are late and rainy, the preservation of grain crops is mostly arduous and difficult. Consequently, other methods besides those commonly employed, and which have been already detailed, are had recourse to occasionally, such as what are termed gaiting and hutting. These modes are, however, only practised in such cases as where, from the precarious state of the weather, the crops would be in great danger of being spoiled, without some unusual exertion. These methods are made use of in several of the more northern counties of England. as well as in some parts more towards the north in Scotland, and do not appear bad methods of harvesting grain crops in late unfavorable seasons. The work is executed in this manner: the sheaf, instead of being bound tight towards the butt-end, as is commonly the case, is tied slackly, and the band moved up until it reach some of the ears. The binder then sets the sheaf in a rather forcible manner on its bottom, so as to give it a sort of base to stand upon. And, where the corn is gaited by those who are experienced in the business, the bands are constantly pushed down the middle of the sheaves, after they have been set on end, and the bottoms spread out, the middles being left hollow, and care taken to form small openings towards the south, by which contrivance the air as well as the sun have the greatest possible influence in preserving the crops, and rendering them fit for being carried and stacked up. In cases where grain crops are cut in a wet state, as not unfrequently happens towards the end of a late harvest, this is in all probability the best plan that can possibly be devised for preventing the threatening mischief. The mode of hutting in the field, in order to save grain in bad harvest seasons, is also a practice often had recourse to with success, in the north-western parts of Scotland, especially when put up in a tolerable state of dryness. The huts are made upon the field immediately after the crops are reaped, and bound up into sheaves. They are, in general, only formed of such a size, that a man is capable of building them in standing upon the ground; and consist in common of from twelve to twenty stooks, in proportion as the straw is more or less bulky. If these huts be properly formed, and a sheaf or two carefully spread over their tops, somewhat in the umbrella method, scarcely any weather, however bad, or of whatever continuance, will affect the grain in any material degree. Upon taking one of these huts down, after it had stood five or six weeks, or probably longer, under the most severe rains that had happened during any harvest for a great length of time, it was found that, except a few of the top-sheaves, the whole was in a surprising state of preservation. And this was the more remarkable, as the crops in some of the adjacent fields where this precaution had been neglected, though carefully stooked and hooded, were grown and matted together in such a way that every stook formed a united mass, not only of vegetable, hut vegetating matters. In places where the harvests occur at a late period, where the weather is unfavorable, and where the approach of winter is apprehended, the practice of hutting grain in the field may be safely ad-vised as a beneficial plan: and where the weather continues long rainy, and there is reason to apprehend the springing of the grain in the ear, or that heavy falls of snow may take place, as occasionally happen, the most proper method is to reap and gait as expeditiously as possible.

With regard to the business of carrying the crops from the fields, notwithstanding there is much diversity in the size, shape, and construction of the carts and waggons that are employed for the purpose, as well as in the strength of the teams by which they are drawn, there is but little variation in the general mode of conducting the work. The grain crops, in whatever mode they may be harvested, are put upon the carriages by persons stationed in the fields expressly for the purpose, and on being drawn to the rick-yard are forked by the carters to the stacks.

It has been lately suggested, that, where the number of teams is sufficient, in carting the wheat crops, three waggons should be employed somewhat in this manner, one of them loading in the field, one unloading, and one upon the road going in different directions. For this, five or six horses are quite sufficient, with two men to pitch, the same number to load, one to drive, and two to manage the business of unloading ; in the whole seven, which make great despatch. But the use of single horse carts is far superior, whatever the number of horses employed in the work may be. Let each of these be in a well formed cart, and a great deal more ground will be cleared than can be effected by the waggons.

In instances where the grain crops are harvested from the swaths, a number of persons are employed in the business of stacking, an operation which is conducted in the same way as for hay; but, where the grain is bound up into sheaves, one person only is necessary in forming the stack, unless where it is of more than ordinary dimensions; in which case the assistance of a boy is commonly required, who receives the sheaves from the carter, and hands them to the man who is employed in building the stack.

HARVEY (William), M. D., an eminent English physician of the seventeenth century, took his degree of M. D. at Cambridge ; was afterwards admitted into the college of physicians in London, and was appointed lecturer of anatomy and chirurgery in that college. In these lectures he opened his discovery relating to the circulation of the blood; which, after a variety of experiments, he communicated to the world in his Exercitatio Anatomica de motu Cordis et Sanguinis. He was physician to king James I. and to king Charles I., and adhered to the royal cause. In 1651 he published his Exercitationes de generatione Animalium, a very curious work. His papers were destroyed during the civil wars. In 1654 he was chosen president of the college of physicians in his absence ; but, as he could not discharge the duties of that office, he desired them to choose Dr. Pringle. As he had no children, he settled his paternal estate upon the college. In 1653 he built a library and a museum; and in 1656 he brought the deeds of his estate and presented them to the college. He was then present at the first feast, instituted by himself, together with a commemoration speech in Latin, to be spoken on the 18th of October, annually, in honor of the benefactors to the college : and he appointed a handsome stipend for the orator, and also for the keeper of the library and museum, which are still called by his name. He died in 1657. This great physician had the happiness, in his life-time, to find the clamors of ignorance, envy, and prejudice against his docHARVEY (Gideon), M. D., an English physician, born in Surrey. He studied at Leyden, and was admitted fellow of Exeter College, in 1655. He was physician to Charles II. during his exile, and to the English army in Flanders. After the Restoration he was made physician of the Tower. He wrote several works on medicine; but of no importance. He died about 1700.

HARVEY'S ISLE, a low island of the Pacific, or rather three or four small islands, united together by rocks and often covered by the sea; the whole being about twenty miles in circumference, and discovered by captain Cook in 1773. Long. 158° 54' W., lat. 19° 18' S.

HARVIE (Alexander), a native of Scotland, who merits to be commemorated in a Dictionary of Arts, for having, at the imminent risk of his life, first introduced the inkle manufacture into Great Britain. He went over to Holland about 1732, and in spite of the care which the Dutch took to conceal their methods of manufacturing, brought over from Harlem two of their inkle looms, and one of their workmen; by whose assistance he established the first inkle manufactory at Glasgow, which was afterwards copied at Manchester, &c.

HARUSA ISLAND, the third in size of five large islands between Bergen and Drontheim, on the coast of Norway, to the northward of Broad Sound. It has a high hill in the middle.

HARUSPICES, or ARUSPICES. See ARUSPICES.

HARUSPICY, the art of foretelling future events by attending to various appearances of the victims offered for the purpose. 1. It was an ill omen if the victim needed to be dragged to the altar, if it broke its rope, fled away, avoided the stroke, struggled much after it, made a great bellowing, was long a-dying, or bled but little. 2. Presages were drawn from inspecting the noble parts, as the heart, lungs, spleen, and especially the liver. If all these were sound, if the top of the liver was large and well made, and if its fibres were strong, it presaged well. 3. They were also drawn from the manner in which the fire consumed the victim. If the flame brightened immediately, was pure and clear, rose out till the victim was consumed, these were happy signs. 4. The smoke also was considered, whether it whirled about in curls, or spread itself to the right or the left, or gave a smell different from the common one of broiled meat. 5. It was a lucky omen if the incense they burned melted all at once, and gave a most agreeable smell. See DIVINATION.

HARUTSH, an eastern range of mountains in Fezzan, North Africa, bordering on the Libyan Desert. Horneman was told that it extended seven days' journey from north to south, and five from east to west. It appears to be composed of basalt and limestone. The former predominates in the Black Harutsh, the most easterly part of the chain, and appears to have been the Mons Ater of the ancients. Horneman passed range after range, through narrow valleys, or rather ravines, often steep, and obstructed by loose stones; but ³ was is where of great altitude.

On the western side occurs the White Harutsh, consisting of that species of limestone which is distinguished by the multitude of its shells and marine petrifactions. The district consists of a vast plain, interspersed with mounds, or isolated hills. The stones covering the surface, and even the rocks which rise above it, have the appearance of being glazed. Mr. Horneman was informed of black mountains on the road leading southwards to Bornou, whence the people of Fezzan got their iron.

HARWICH, Sax. harewic, a haven, an ancient sea-port, borough, and market town, of Essex, eleven miles and a half east from Manningtree, and seventy-two E. N. E. from London; where the rivers Stour and Orwell (both navigable twelve miles above the town) unite and form a large bay, falling afterwards into the German Ocean, by a strait nearly three miles wide, at high water. The east side of the bay is defended by Landguard-fort in Essex, standing on a point of land which, at high water, has the appearance of an island. The fortifications were here first erected by James I. Harwich was also forti-fied on the land side; but the works were destroyed in the reign of Charles I. and a battery erected, instead of them, by the water. The harbour, which is independent of the bay, is safe, convenient, and of great extent, being capable of receiving the largest ships of war.

The church, which is a neat building, was formerly a chapel of ease to that of Dover-court, two miles distant. The town, in general, is well built, and consists of three good principal streets, where are a town-hall, a gaol, a free-school, and a custom-house. The town is walled in, and the streets paved with a kind of clay from the neighbourhood, which soon becomes hard as stone. Here is a good dock-yard, furnished with storehouses and other conveniences, in which third rate, and other large ships are built, and two hot and two cold salt-water baths, of elegant structure, with commodious dressing rooms. The buildings stand in a large reservoir, containing many hundred tons of water, renewed every tide: from this the baths are continually supplied with pure running sea-water, in a manner exactly resembling a natural spring. Here are also vapor baths, and a machine to throw the sea-water, either hot or cold, on any part of the body. The town was made a free borough in the reign of Edward II. The corporation consists of a mayor, eight aldermen, twenty-four burgesses, a recorder, &c. It sends two members to parliament, the mayor being the returning officer, who has also the power to hold admiralty courts. It has a neat, clean, commodious, and enclosed market place, well supplied with all kinds of provisions, and particularly with fish. Several fish machines run from Harwich, in a very expeditious manner, to supply the London market. High water, at the full and change of the moon, at half past eleven o'clock. Fairs, 1st of May and 18th of October, for three days each. The post-office packets sail hence, and return twice a week to and from Holland and Germany. Upwards of 3000 tons of shipping are employed in the North-Sea fishery, besides other vessels engaged in the London and coasting trade. Two light-houses

have been erected on the Harwich side of the harbour, to facilitate the entrance by night.

HARWOOD, (Edward), D. D., a learned dissenting clergyman, born in Lancashire, in 1729. He was pastor of a congregation at Bristol, whence he was obliged, partly on account of gross immorality, and partly because of his zeal in the Arian controversy, to remove to London; where he taught the classics. He published a Translation of the New Testament; a view of the various editions of the Greek and Roman classics; and many other books and pamphlets. He died at London of a paralytic complaint, which had confined him to the house for fourteen years, and deprived him of the use of his left side, January 14th, 1794, aged sixty-five.

HARWOOD, a small but neat town in the North Riding of Yorkshire, with a costly stone bridge of eleven arches over the Wherfe, which runs in a bed of stone, and is as clear as rock water. Near it are the ruins of an ancient castle, built soon after the conquest; and which was a neat strong building in Camden's time. It had a variety of masters; one of whom, in the reign of king John, obtained a grant for a market and fair here. In the reign of Edward III. it was valued at 400 marks a year. This castle was ruined in the civil wars; before which it covered nearly an acre of ground. In the church are some ancient monuments, particularly that of lord chief justice Gascoigne.

HASE (James and Theodore), two learned German writers of the eighteenth century, brethren, and authors of Dissertations, and other classical works. Theodore was professor of Hebrew at Bremen, and died in 1731, aged forty-nine. James died in 1723.

HASH, v. a. Fr. hacher. To mince; to chop small and mingle.

He raised his arm

Above his head, and rained a storm

Of blows so terrible and thick,

As if he meant to hash her quick. Hudibras.

What have they to complain of but too great variety, though some of the dishes be not served in the exactest order, and politeness; but *hashed* up in haste? *Garth*.

HASK, n. s. Teut. hals (collum).—Minsheu. Probably from its shape; a case made of rushes or flags. Obsolete.

Phœbus, weary of his yearly task,

Established hath his steeds in lowly lay,

And taken up his inn in fishes hask. Spenser.

HASLEMERE, a borough and market town of Surrey, on the edge of the county, next Hampshire, forty-two miles from London. It is an ancient place, and was once destroyed by the Danes. It is a borough by prescription, and has sent two members to parliament, since the reign of Edward IV. chosen by a bailiff, and burgageteeners, about sixty in number, under the influence of the marquis of Lonsdale It is said to have had seven parish churches formerly, though now but one.

HASLINGDEN, a market town in the county of Lancaster, on the river Swinnel, and on the road from Bury to Blackburn. It has a canal navigation to Manchester on the one hand, and to Leeds and Liverpool on the other. Here are flourishing woollen and cotton manufactures. The houses are built of stone; and, besides a neat church, there are two chapels for dissenters. Population upwards of 5000. Market on Wednesday. Seventeen miles north of Manchester, and 203 north-west of London.

IIASP, n. s. & v. n. Sax. papr; Isl. hassa is to hold. In some provinces it is yet called hapse. A clasp folded over a staple, and fastened on with a padlock; to shut with a hasp.

-----And to the chambre dore he gan him dresse, His knave wos a strong carl for the nones, And by the haspe he haf it of, at ones;

Into the floor the dore fell anon.

Chaucer. The Milleres Tale. Have doors to open and shut at pleasure with hasps to them. Mortimer.

HASSAN PACHA, an African of modern times, who became grand vizier of Turkey. He served when young in the Algerine navy, and, being taken by the Spaniards, was sent prisoner to Naples. Having obtained his liberty he entered into the service of the grand seignor, and was at the battle of Tschemé fought against the Russians. He was soon after appointed capitan pacha, or high admiral; in which post he maintained himself some years. He vanquished the Egyptian insurgents; re-established order and tranquillity at Smyrna, in 1775; took Gaza, Jaffa, and Acre; and beheaded the famous Daher, sheik of the latter city, who had for years rebelled against the Ottoman empire. Hassan returned to Constantinople loaded with treasures and with high renown : but, the beys having again revolted, he returned to Egypt in 1786, and gained a signal victory over the rebels. In 1788 war was renewed between the Turks and Russians, and the chief command of the forces by sea and land was entrusted to the capitan pacha. But the season was unfavorable for operations, and bloody battles were fought without any decisive advantage. Okzakow was at length taken by the Russians, and this misfortune occasioned the dismissal of our commander : he was sent to Ismail with the rank of a pacha of three tails. Defeat still attending the Ottoman arms he was recalled and made grand vizier in 1789: but he was worn out, and died in March, 1790, at the age of eightyseven.

HASSELQUIST (Frederick), M. D. an eminent Swedish naturalist, born at Tournalla, in East Gothland, in 1722, and educated at Upsal, under the great Linné. By the advice of that eminent botanist, with the assistance of the University of Upsal, who granted him a salary for the purpose, he set out upon a voyage to Palestine, in summer 1749, with the view of investigating the natural history of that country, and thereby illustrating eastern philology, and elucidating many passages in the Old Testament. In this enterprise he also received much pecuniary aid, by private subscriptions. By the interest of counsellor Lagerstroem he obtained a free passage, in a Swedish East Indiaman, to Smyrna; where he arrived in December 1749, and was most hospitably received by M. A. Rydel, the Swedish consul. In January, 1750, he set out for Egypt, and spent nine months at Cairo whence he transmitted to Linnæus some specimens of his discoveries, which were published

65

with great approbation. A collection of 10,000 dollars was then made to enable him to continue his travels and researches. In spring, 1751, he passed through Jaffa to Jerusalem, Jericho, &c., returning through Rhodes and Scio, to Smyrna. Thus he completed the object of his mission, but unfortunately fell a sacrifice to the heat of the climate, which, in his travels through Arabia, had affected his lungs so severely, that he died at Smyrna, February 9th, 1752, aged thirty. The Turks, with their usual rapacity, having seized his collections, were prevented from selling them by the Swedish consul, who wrote home an account of his death and circumstances; whereupon queen Louisa Ulrica generously sent 14,000 dollars to redeem them; and the whole collection, consisting of numerous antiques, shells, birds, insects, serpents, Arabian MSS. &c., arrived in good preservation at Stockholm, and was lodged in the cabinets at Ulrichsdale, and Drottningholm; duplicates of many of them being also sent to Linné at Upsal, who published an account of his deceased friend's voyage and observations.

HASSELQUISTIA, in botany, a genus of the digynia order, and pentandria class of plants: natural order forty-fifth, umbellatæ. The fruits are quite smooth; the seeds of the radius oval, plane, marginated, and convex in the middle; those in the disk hemispherical and urceolated, or bladder-shaped.

HASSER, ASEER, or ASOOTAHMA, a hilly district in the province of Khandeish, Mahratta territories, between 21° and 22° N. lat. The country contains many strong positions, on which the chiefs have erected fortifications. The land is fertile, and tolerably well watered by the Tuptee and Poornah; the chief towns are Boorhanpore, Hasser or Aseer, and Chandah.

HASSER, properly ASEERGHUR, a town and fortress of Hindostan, once the capital of Khandeish. In the year 1803 it surrendered, after a slight resistance, to a division of the Madras army under colonel Stephenson. The town, which stands at the foot of a mountain, is extensive; but, on the removal of the seat of government to Boorhanpore, it fell into decay. It was restored to the Mahrattas, at the conclusion of peace. Long. 76° 21' E., lat. 21° 32' N.

HA'SSOCK, n. s. German haseck.-Skinner. A thick mat on which men kneel at church. In Scotland it is applied to any thing made of rushes or privet, on which a person may sit.

He found his parishioners very irregular; and in order to make them kneel, and join in the responses, he gave every one of them a hassock and common Addison. prayer-book.

HAST, the second person singular of have.

HASTATI, in the Roman armies were veteran spearmen who wore a complete suit of armour, and carried a convex buckler of four feet six inches in length, and two feet and a half in breadth. The hastati likewise wore a sword, which they carried at their right thigh, and which was called the Spanish sword. This weapon was calculated both to cut and thrust, the blade being very broad, thick, and pointed. They had each, moreover, two pikes, a brass helmet, and

half boots. One of the pikes was thick, and the other of a middling size. See BATTLE.

HASTE, n. s., v. n. & v. a.	French, haste,
HASTEN, v. n. & v. a.	haster; Dutch,
HAS'TENER, n. s.	haerte, hasten;
HAS'TILY, adv.	Goth. haust, hast.
HAS'TINESS, n. s.	The primary idea
HAS'TINGS, n. s.	is rapidity;
HAS'TY, adj.	speed; precipi-
HASTY BUDDING TO	tation . passion .

HASTY-PUDDING, n. s. J tation; passion; vehemence: to move eagerly; to urge, or drive on apace. Hastings, peas that come early. Hasty-pudding, a pudding made of milk and flour boiled together, and stirred quickly to prevent burning to the sides of the vessel.

I said in my haste all men are liars. Psalms.

They were troubled and hasted away. Id. Seest thou a man that is hasty in his words? there is more hope of a fool than of him. Proverbs.

He that is slow to wrath is of great understanding; but he that is hasty of spirit exalteth folly. Id.

Be not rash with thy mouth, and let not thine heart be hasty to utter any thing before God. Eccles. v. 2.

Beauty shall be a fading flower, and as the hasty fruit before the Summer. Isaiah.

I have not hastened from being a pastor to follow Jeremiah. thee.

All those things are passed away like a shadow, and as a post that hasted by. Wisdom.

In alle haste come to me; he saide. Chaucer. The Nonnes Preestes Tale.

The second condition of veray confession is that it be hastily don, for, certes, if a man hadde a dedly wound, ever the lenger that he taried to warishe himself, the more wold it corrupt and hasten him to his deth, and also the wound wold be the werse for to hele. Id. The Persones Tale. hele.

Thus as she her recomforted, she spyde Where far away one, all in armour bright, With hasty gallop towards her did ryde.

Spenser. Faerie Queene.

A voice that called loud and clear, Come hither, hither, O come hastily ! Id.

Is this the counsel that we two have shared, The sisters vows, the hours that we have spent, When we have chid the hasty footed time Shakspeare. For parting us ?

Let it be so hasted, that supper be ready at the Id. farthest by five of the clock.

'Tis Cinna, I do know him by his gait ; He is a friend. Cinna, where haste you so ?

Id. There is most just cause to fear, lest our hastiness to embrace a thing of so perilous consequence, should cause posterity to feel those evils. Hooker.

Spare him, death !

But O, thou will not, can'st not spare ! Haste hath never time to hear. Crashaw. Husting to pay his tribute to the sea,

Denham. Like mortal life to meet eternity. The sun

Declined was hasting now with prone career To th' ocean isles, and in th' ascending scale Of heaven the stars that usher evening rose. Milton.

A fellow being out of breath, or seeming to be for haste, with humble hastiness told Basilius. Sidney.

If your grace incline that we should live, Waller. You must not, sir, too hastily forgive.

Our lines reformed, and not composed in haste, Polished like marble, would like marble last;

VOL. XI.

But as the present, so the last age writ,

In both we find like negligence and wit. Id. The turns of his verse, his breakings, his propriety, his numbers, and his gravity, I have as far imitated as the poverty of our language, and the *hastiness* of

Dryden.

my performance, would allow. The wretched father running to their aid With pious haste, but vain, they next invade.

Id.

66

The next to danger, hot pursued by fate, Id. Half clothed, half naked, hastily retire.

These rites performed, the prince, without delay, Hastes to the nether world, his destined way. Id.

Sure hasty-pudding is thy chiefest dish, With hullock's liver, or some stinking fish.

Dorset.

The large white and green hastings are not to be set till the cold is over. Mortimer.

Soon as the sun awakes, the sprightly court Leave their repose, and hasten to the sport.

Prior.

To distant Sparta, and the spacious waste Of sandy Pyle, the royal youth shall haste.

Pope.

Without considering consequences, we hastily engaged in a war which hath cost us sixty millions. Swift.

On-on he hastened-and he drew My gaze of wonder as he flew.

Byron. The Giaour.

HASTED (Edward), a modern historian of Kent, was the only son of Edward Hasted, esq., of Hawley, descended from the noble family of Clifford. He was born in 1732, and possessed at one time a competent landed property. But he fell into difficulties and litigation in regard to it, and lived obscurely for some time in the neighbourhood of London. A few years before his death he removed to the hospital at Corsham, Wilts, to the mastership of which he had been presented by the earl of Radnor; and soon after recovered his estates by a decree in Chancery. His Ilistory of Kent, 4 vols. folio, employed his attention for upwards of forty years. He died 14th of January 1812.

HASTING PEAR, a name given by the gardeners to a species of pear, called also by some the green chisel pear. This is a moderately large pear, and is longish towards the pedicle; its skin is thin, and of a whitish green; the pulp is melting, and of a sugary flavor. It ripens in July. See Pyrus.

HASTINGS, a town of Sussex, and one of the cinque ports. It was formerly obliged to find twenty-one ships, within forty days after the king's summons, well furnished and armed for service, and to maintain the crews a fortnight at its own charge. It is said to have been named from llastings, a famous Danish pirate. In king Athelstan's reign it had a mint. It had charters from Edward the Confessor, Willlam I. and II., Henry II., Richard I., Henry III., Edward I., and Charles II., exempting it from toll, and empowering it to hold courts of judicature on life and death. It has about 600 handsome houses, and 3000 inhabitants; but frequent storms have rendered the harbour indifferent, though a vast sum of money has been laid out upon it. Hastings has sent members to parliament ever since Edward 111. About 1377 this town was burnt by the French; and, after it was rebuilt, it was

divided into two parishes. It had formerly a priory, and was a barony in the Huntingdon Hastings is remarkable for a battle family. fought in its neighbourhood, between Harold II. king of England, and William duke of Normandy, on the 15th of October 1066, in which the former was defeated and killed; and by his death William became king of England. The town has of late received a new impulse as a watering place; and from the beauty of the situation, the mildness of the air, and the excellence of the beach, it rivals many of the others on the southern coast. On approaching the town, by the London road, a beautiful and extensive prospect opens of the town and ocean, and the distant coast and hills. The environs also abound with picturesque scenery. A walk, called the Marine Parade, has been formed on the west, and close by it stand the bathing machines on a fine sandy beach, sloping gently to the sea. Convenient warm baths have been established, a library furnished with newspapers, &c., a billiard-room; and an assembly held twice a-week. The town itself is well paved, and consists of two parallel streets running north and south, and divided by a rivulet called the Bourne. The public buildings are, two very ancient churches; the townhall, built in 1700, with the market place under it; the custom-house, which employs twelve riding officers; two excellent free schools; and a barrack for foot soldiers. The remains of an ancient castle are to be seen on a rocky cliff to the west of the town, and still farther on those of a priory of black canons. Two miles from the town is the stone on which William is said to have dined when he landed here, and still called the Conqueror's stone. Hastings sends two members to parliament. Markets on Wednesday and Saturday. It is thirty-six miles south-east of Tunbridge, and sixty-four south-east of London.

HASTINGS (Warren), esq., was born in 1732 at the village of Churchill, in Oxfordshire, where his father was a clergyman. He was educated at Westminster, and went in 1750 to Bengal, as a writer in the East India Company's service. He returned to England in 1765 with a moderate fortune. In 1768 he received the appointment of second in council at Madras; and was removed in 1771 to Bengal, to the presidency of which he was raised in 1772. The following year he was appointed governor-general of India. In 1778, the commission by which he held his office expiring, it was renewed first for a single year, and in 1781 for ten years longer : lord North, who had endeavoured to remove him in 1776, thinking it afterwards desirable to retain him in that post. During the celebrated coalition between Mr. Fox and lord North, the censures of the ministerial party were cast on Mr. Hastings, for his conduct in his government, and especially for his treatment of the native princes of India. Mr. Hastings returned from his government in 1786 to meet an impeachment. After proceedings protracted through a period of nine years he was acquitted, and retired, with the wreck of his fortune and an annuity from the Company, to Daylesford in Worcestershire. He was made a member of the privy council; but devoted the evening of his life to literary pursuits, and died 22nd of August 1818. He published various Speeches and Papers on Indian Affairs, and a volume of poetry.

They had hats of blue velvet, with fine plumes of divers colours, set round like hatbands. Bacon. His hat was like a helmet, or Spanish montero.

Its hat was like a heimet, or spanish montero.

Hermes o'er his head in air appeared, And with soft words his drooping spirits cheered ; His *hat* adorned with wings disclosed the god,

And in his hand he bore the sleep-compelling rod. Dryden.

Room for the noble gladiator : see

His coat and hatband shew his quality. Id. I might mention a hatcase, which I would not exchange for all the beavers in Great Britain.

Addison.

A hatter sells a dozen of hats for five shillings a-piece. Swift.

HATS. This important article of modern commerce and personal convenience is of recent adoption in Europe. Hats are said to have been first used by men at the beginning of the fifteenth century. But the hatters have a tradi-tion among them, that while St. Clement, the fourth bishop of Rome, was fleeing from his persecutors, his feet became blistered, and, to afford him relief, he was induced to put wool between his sandals and the soles of his feet. On continuing his journey, the wool, by the perspiration, motion, and pressure of the feet, assumed a uniformly compact substance, which has since been denominated felt. When he afterwards settled at Rome, it is said he improved the discovery; and from this circumstance has been dated the origin of felting. Hatters in Ireland, and several Catholic countries, still hold their festival on St. Clement's day. Hats, however, are first spoken of in history at the period when Charles VII. made his triumphant entry into Rouen, in the year 1449. In F. Daniel's account of that entry, that prince, he says, astonished the whole city by appearing in a hat lined with red silk, and surmounted by a plume of feathers: from this entry their ge-neral use is dated. In process of time the clergy also assumed this part of the habit of the laity, but it was looked on as a great abuse, and several regulations were published, forbidding any priest, or religious person, to appear abroad in a hat without coronets, and enjoining them to keep to the use of chaperoons, made of black cloth, with decent coronets; if they were poor,

they were at least to have coronets fastened to their hats; and this upon penalty of suspension and excommunication. The use of hats, indeed, is said to have been of longer standing among the ecclesiastics of Brittany, by 200 years, and especially among the canons; but these were, in fact, a kind of caps; whence arose the square caps worn in colleges, &c. By the statute of 13 Eliz. every person above the age of seven years, and under a certain degree, was obliged on Sundays and holidays to wear a woollen cap, made in England, and finished by some of the fraternity of cappers, under the penalty of 3s. 4d. for every day's neglect. This statute was repealed 39 Eliz. From Stow's Chronicle we learn, that about the beginning of Henry VIII. began the making of Spanish felts in England, by Spaniards and Dutchmen. In the second year of James I. the felt-makers of London obtained a corporation, and hired a hall near Christ Church, the king granting them various privileges and liberties for their support.

Hats are at present made in different countries on the continent, and in America; but, except in France and our own country, they have not been much attended to as an article of commerce. From France they were exported in large quantities, to Engiand, Spain, Italy, and Germany; the quantity now made there is inconsiderable; England has, in its turn, become the grand mart for the manufacture; and hence the article is exported to different parts of the continent, America, and various other parts of the globe.

Felt hal-making cousists in a method of working up wool or hair into a species of cloth, independently of either spinning or weaving; and giving it a convenient form, with a degree of stiffening sufficient to preserve its figure, and to answer the purposes of wearing. The mechanism of felting is curious and interesting; it depends on the conformation of all animal hairs and wool, which disposes them to unite with each other in such a manner as to produce a firm and compact substance.

On examining hairs, or filaments of wool, with the naked eye, or even by a low magnifying power of the microscope, they appear perfectly smooth and even. Their surface, notwithstanding, is by no means smooth; but composed of lamellæ, covering each other from the root to the point, in a manner resembling that by which the scales of a fish cover the animal from the head downwards. This disposition of the lamellæ on the surface of hairs is discoverable by holding a hair with one hand, and drawing it between two fingers of the other, in the different directions from the root to the point, and from the point to the root. In the former case no sensible friction takes place, nor is any roughness discoverable; in the latter we discover a very sensible resistance, which is most readily dis-cerned by moistening the fingers. The following experiment is still more decisive. By holding a hair between the fore-finger and thumb, and rubbing it in the longitudinal direction, a progressive motion takes place, and this motion is invariably towards the root, or with the root of the hair foremost. For example : if the hair be held in a perpendicular direction with the

 F_2

root upwards, by rubbing the finger and thumb together, it will be found to assume a motion by which the extremity of the hair, pointing upwards, will rise still higher; but if the hair is turned, so that the extremity farthest from the root be placed upwards, its rising motion is discontinued, and it immediately recedes downwards.

This conformation of the surface of hairs and wool, which appear to be composed of hard lamellæ or asperities, placed over each other like tiles from the root to the point, lays the foundation of felting. In a layer of the material, by the operation it undergoes, the hairs are brought into close contact by their progressive and uniform motion towards the root; and, meeting in various directions, they become twisted together, the lamellæ of the different hairs fixing themselves to others directed in a contrary way, at the same time preserving the whole in a close and compact substance.

The materials in general use are, lambs' wool. rabbits' and hares' fur, beaver, seal wool, monkey stuff, or neuter wool, camels' hair, goats' hair, or estridge, silk, and cotton. Moles' fur, and otter wool, are likewise sometimes made use of. The foreign lambs' wool generally used is the Italian, Spanish, and Peruvian, or Vicuna wool, commonly known among hatters by the name of red wool. Our native wools are of various qualities : those in most esteem are the Herefordshire, or Ross wool, Southdown, Wyc-side, Wiltshire, Somerset, and Hampshire. There is likewise wool sheared from Spanish lambs bred in England, known by the name of merino. Cod-wool is the wool plucked from lambs who die in the birth; long cod-wool is that plucked from lambs who die in early life. The best fur is from the backs of the different animals, and it decreases in value as it approaches the belly. Rabbits' fur, including the backs, and the best part of the sides mixed together, is known in the market by the name of best stuff; the fur from the bellies and worst part of the sides, seconds; that from odd bits of skins, &c., clippings; and the fur taken from rabbit-skins, when they are out of season, is denominated quarter-wool. The fur from unseasoned hare-skins is called stage hare-wool: with this is mixed also the inferior fur from seasoned skins. The best fur from the beaver is ruffing; the next in value cheek-napping; and the inferior sorts are black-wooms, brown-wooms, white-wooms, brown-stage, and white-stage. Old-coat is taken from the beaverskins that have been worn by the savages; but little of this article is now imported.

The wools are washed and carded, and, when very long, cut to a moderate length with a chopping knife, or hatchet, on a wooden block. White Russia, best-stuff, and hares' wool, and the most inferior stuffs, as clippings, tail-wool, &c., are improved by the operation of carroting. For this purpose a layer of the stuff is placed in a box, or any suitable vessel not of metal, and sprinkled over with a mixture of about one part nitrous, or nitrous and sulphuric acid, and six parts water by means of a brush. A second layer is then placed in the vessel, which is again sprinkled with the acid mixture; this is repeated

till it is full. To prevent the liquor running down into the bottom of the vessel, without equally wetting all the stuff, its position is frequently changed in the course of the day; it is then kept in the digesting heat of a stove all night. By this treatment the stuffs acquire a ruddy or reddish-yellow color, like the inner part of a carrot, from which it derives its name.

In felting any of these materials together, the first object of the workman is to obtain the most complete separation of the fibres, and to dispose a layer of them in every possible direc-tion with regard to each other; this is effected by means of bowing. For this purpose a plat-form of wood, about four feet wide, is erected against the wall of a convenient shop, and divided by side partitions about the same width from each other, into distinct portions, for the convenience of different workmen, called hurdles, each of which is enlightened by a small window. To each hurdle is suspended a bow by means of a small cord fixed to the ceiling, or any other convenient place, consisting of a pole about seven feet long, generally made of dealwood, to which are fixed two bridges of hard wood, the upper one nearest the window called the cock, and the lower one the breech. To the upper part of the pole, above the cock, is fastened a cat-gut line, or bow-string, of considerable length, and twisted round the pole, leaving only sufficient to bring over the cock and breech, and to fasten to the lower part of the pole; thus, when the string breaks, it is partly untwisted from the upper end of the bow, and the necessity of a new one is prevented. To preserve the wood from wearing, by the action of the bow-string, a strip of horse-skin, or vellum, is fastened to the edge of each bridge; and near the cord, by which the bow is suspended, is fastened a small strap to place the hand in, which enables the workman to hold it with firmness. The bow-pin is a small stick with a knob at each end for plucking the bowstring.

As the process of making is a little different in different kinds of hats, we shall first describe that of wool hats or cordies. A quantity of carded wool, of one or more sorts, sufficient for one hat, generally about seven or eight ounces, is laid on the hurdle towards the left. The workman then holding the bow horizontally in his left hand, under the strap, and the bow-pin in his right, placing the bow-string near the right hand edge of the material, gives it a pluck with the pin. The string immediately flies back nearer to the pole than its situation was when at rest, strikes into the wool, and, instantaneously returning to its original position, scatters a part before it to a distance proportioned to the force with which it was pulled. By repeated strokes the whole is thus worked, observing, after each stroke, to raise the string, by giving the bow a turn with the left hand. This breaking over, as it is termed, is repeated several times, more or less, in proportion to the difficulty with which the hairs are disunited; when all the fibres are completely separated, the material is again placed towards the left hand side of the hurdle, and the workman proceeds, with more order than before, to scatter the wool to the right hand, so as to form a thin regular layer; which he effects by duly proportioning the force of his strokes, and the position of the bow. When about one-third part is thus bowed, it is formed by the hands into an oval figure, ending in acute angles at the extremities. This portion of the material, thus formed, is called a batt.

The batt is hardened by a slight pressure with the hands for a short time, so as to connect it together sufficiently to bear eareful handling. Another batt is then formed of the same dimensions; and, with the remaining third part, two smaller batts are formed, which are separately united to the primary ones by a little pressure. This gives each of them a more uniform consistence than would be obtained by forming single batts only. It was formerly common to form six batts for each hat, but few are now willing to devote sufficient labor for the purpose. It is necessary to remark, that the batts are bowed thicker in that part which is designed to form the band of the intended hat; and, to give them a finish, the edges are torn round even by the right hand, while the pressure of the left prevents their being torn in too far.

It now remains to connect the parts together in some convenient form, and to proceed in the operation of felting For this purpose, a wet cloth is folded so as to form a triangle, and laid on one of the batts. The extremities of the batts, with a small portion of the upper part, is then folded over the cloth, and the edges meeting over each other form a conical cap. This cap is laid on the second batt with the joining downwards, which being also folded up in the same manner, their places of junction will be diametrically opposite each other. This is laid on a second wet cloth, which is closely folded over the whole, so as to preserve the triangular figure; it is then ready for basoning. The bason is a circular piece of iron, exactly the same as those commonly used in Wales for baking over the fire, called backstones. This is laid over a hole in a plank, underneath which is a small grating fitted to the plank for this purpose. The prepared cap is then laid on the warm iron, and the process of felting carried on by folding, pressing, and sprinkling it continually with water. The corners being folded over a little, the base is first turned up towards the tip; and in this state it is worked a short time by pressing with the hands, moving them backwards and forwards, and shifting them about in various directions. Each side is then folded over towards the other alternately, the tip part towards the base; and, in general, it may be folded in any or every direction, repeating the pressure and working of the wool, and sprinkling it successively after every fold. By this pressure, and working the wool in various directions, the points of contact are multiplied; and the agitation given to each hair eausing a progressive motion towards the root, and a coalition with each other, it soon acquires some degree of firmness and contracts in its dimensions.

On taking off the cloth, and opening the hood or eap, it will be found that the edges, or original folds, will not have that even and uniform appearance with the rest of the surface, but small ridges will be formed by a small part of the sides felting together at the outward edges, which will be considerable if care has not been taken in the first place to fold the batt closely over the inlayer. It is found necessary, therefore, to alter the position of the original edges, by turning round the cap, to extend them a little with the finger so as to produce a uniform surface, and with the hood in this position to continue the basoning as before. It is afterwards turned inside outwards, and the same operation continued. The workman afterwards opens the hood, holds it up to the light and looks through it from the inside to discover any parts that may be unusually thin; and on any of these parts, which are deficient, a little wool is added from that which was torn off the edges of the batt; and by working that particular part on the bason it is made to unite. When this is done, the process of basoning is completed, When this is which generally takes from about twenty minutes to half an hour.

The hood now consists of a soft spongy kind of stuff, and its texture is loose and imperfect. To produce a more intimate cohesion of the hairs with each other, and obtain the requisite degree of consistence, it must undergo a kind of fulling, and a more effectual mechanical ope-For this purpose, the hats are first ration. boiled in an iron boiler, in a mixture of about one part urine to six parts soft water, from six to eight hours. To prevent their touching the boiler, they are enclosed in a cloth; a basket, or, more generally, a lining of straw is placed round the sides, and at the bottom of the boiler. The felting is completed by working or planking at a water bath.

For the convenience of any particular number of workmen, an apparatus, called a battery, is generally made use of for this part of the process, consisting of a proportionate number of wooden planks, joined together in the form of the frustum of a pyramid, supported by stone or brick-work, and meeting at the bottom in a kettle, under which is a fire-place. The number of planks is most commonly from five to seven; and, according to the number made use of, it is called a five, six, or seven-room hattery, &c. Each plank is from two to three feet broad at the upper edge, and about two feet deep. The kettle is generally of cast-iron or lead, and kept full of soft water, as nearly boiling as the nature of the operation will admit. To facilitate the felting, it is found necessary to add some softening material to the bath : for this purpose, some spermaceti, a marrow-bone, or shreds of washleather, have been thrown in; but oatmeal is at present almost universally used; about a tablespoonful is thrown into the kettle, and oeeasionally repeated as fresh water is added, or as it may be found necessary. The more greasy substances will answer for the purpose of planking, but it prevents the hats from taking a good dye; leather-shreds answer very well, but are not always so easy of access as oatmeal.

The operation commences by dipping the article in the bath, and gently rolling it in various directions, observing a degree of regularity, as

in basoning, or its receiving more work in some parts than others will soon give it an irregular and shapeless appearance. It is necessary to be careful at first to turn the hood inside outwards, and to shift the position of its sides frequently to prevent their felting together, of which, in the subsequent stages of the process, there will be no danger. By working a short time in this way, the article will be found to have acquired a considerably firmer texture, and to have contracted very rapidly in its dimensions. The workman then applies leathern gloves, or flat pieces of stout leather, to the palms of his hands, to secure them in some degree from the heat of the water, and continues to dip it much oftener, and to roll it much harder than before, as it requires more labor, in this degree of felting, to obtain the firmness and consistence. In the first gentle rolling, an impulse, nearly equal, was given to the hairs in every direction, and hence it so readily contracted in its dimensions at the same time that it acquired a degree of firmness in substance. In rolling it harder the pressure is more particularly on the flat surface of the felt, and this acquires a more compact texture, without an equal contraction in the size. It is however necessary to prevent any contraction in size when it is sufficiently shrunk, and yet worked to any degree of consistency. For this purpose a small roller of wood, called a walking-pin, is made use of: over this the edges of the felt are turned, and the whole is rolled in various directions with the walking-pin enclosed by the surrounding felt; at the same time continuing to dip it often in the bath. This completes the working at plank; and on the labor thus given its service in wearing will principally depend.

The intended hat, after the preceding operation, still possesses the conical figure first given it, consisting of a soft flexible felt, capable, with a moderate degree of force, of being extended in every direction. The next thing to be done is to give it the required form. For this purpose the edge of the hood is turned up about one and a half or two inches: the point is then indented with the fingers, and the hood turned over, so as to produce a second inner fold about the same depth. From three to five folds are thus formed, and the whole has the appearance of a flat piece, consisting of a number of concentric circles, or wave-like undulations. This is laid upon the plank, and the workman, keeping it wet with clean warm water, extends the central point with the fingers of his right hand at the same time pressing it down with his left, and turning it round on the plank, till a flat portion is formed equal to the intended crown of the hat. The flat part is then placed in a block, and the remainder pulled down with the hands round its sides and a string tied tight round ; it is forced down to the bottom of the block with a wooden or copper stamper, which forms the band. The brim will now have a curling inclination towards the crown, but is soon flattened by wetting and extending the edges. The water is afterwards pressed out of the hat with the blunt edge of the stamper, and the nap is raised by carding it in any direction with a small wired instrument called a raising eard. The hat is then taken off the block and placed in a stove to dry, when it is ready for the subsequent operations of dyeing, stiffening, and finishing. These instructions for blocking refer particularly to the common round hat now generally worn; but from the nature of the felt it will be seen that any form may easily be given it by the skill of the workman, with a corresponding block.

The above account comprises the general principles of hat-making, and is the foundation of every variety in the art. Common wool hats, or plain cordies, are of one uniform contexture throughout; but ingenuity has contrived a method of making the most of the materials employed, by placing the best side outwards. This is done by laying on the body of the hat, when partly felted, a finer and more valuable material, in the same direction it has when on the back of the animal. For the purpose of covering wool hats, the articles made use of are cod-wool and camel's hair: the former of which, after washing and carding, is boiled about an hour and a half in one part urine to about twelve or fourteen parts of water. The hats covered in this manner are bowed, basoned, and boiled in the usual manner, the common materials being used only in less quantity, proportioned to the addition intended to be made. A thin layer of the prepared codwool, with or without the addition of hair, is then bowed for each side of the triangular hood, so as just to meet at the edges; and another piece to go all round on the inside to the depth of the intended brim. The pieces are laid on the principal stuff or body of the hat, and worked on by basoning in the manner already described : the hairs assuming a motion towards the root, uniformly fix themselves in that direction, leaving the extremities outward which constitute the required nap. After this addition of the nap, the planking takes place as before.

For obtaining a variety of cordies, of different value, they are partially as well as wholly covered with different proportions of napping, and on bodies of wool more or less valuable. Next to the plain hats succeed the tips: these have only a nap sufficient to cover the crown and reach a short way down the sides. To save the trouble of basoning the nap on this kind of hats, it is only laid on with the hands, the hood turned so that the nap may be inside, and a layer of some proper flexible substance, commonly long horsehair, placed between the sides to prevent its uniting: in this manner it is taken immediately to the plank. The second class is tips and naps; these, as well as a cod-wool tip, have a nap of the same on the underside of the brim. And, lastly, succeed the covers. A good cover takes about two ounces of cod-wool, and a hair cover about half an ounce of hair in addition to the cod-wool; these are commonly bowed together; and the former is scarcely ever used for a nap without the addition of the latter.

Stuff hats appear to have been originally made throughout of beaver; the instructions given in the old accounts of hat-making is, to mix three parts of old coat with two parts of castor; but hats made in this way would be much higher in price than any now in general use. The beaver at present is scarcely ever used except in the

outward nap, and the body of the hat is composed of various inferior stuffs in any proportion; commonly with the addition of a little Spanish or vicuna wool, and sometimes a small quantity of silk is added. A patent was granted Mr. James Burn, of Alnwick, Northumberland, for making superfine hats, which, contrary to general modern practice, appear to have been of one uniform consistence. The composition consists of three ounces and a half of moles' fur, two ounces and a half of beaver, and a quarter of an ounce of Aleppo wool; 'and, in order to subdue the obstinate nature of the mole fur,' says Mr. Burn, 'so that it may incorporate with other furs usually made into hats, I use a little aqua regia; but, as that process destroys the elastic quality of the fur, I correct it by a little sweet or Florence oil, which sheathes the pungent points of the aqua regia."

Stuffs possess, in general, a greater tendency to felting than wool, and in consequence some small difference is observed in the manufacture. As the fibres are more easily separable, a slighter bow, with a finer bow-string, is used than that made use of in wool. When the stuffs are bowed in the usual way, the batts are formed and gently pressed down with a piece of osier work, called a gathering basket, consisting of open straight bars only interwoven sufficiently to connect it together, and preserve it in form; it is from eighteen to twenty inches square. This is constantly kept on the hurdle, for the purpose of shifting the stuff as well as for forming the batts. Sometimes one or two of these baskets are placed under the stuff to separate any im-purities that may pass through. To obtain this end more effectually, in the metropolis and several places in the north of England, a fine movable wire frame is placed on the hurdle on which the stuff is broken over, which is again removed, and the impurities swept off the hurdle for forming the batts.

These have their first degree of compactness given them by laying on a hardening skin of smooth leather, or sailcloth; and gently pressing with the hands, which are at the same time slightly moved backwards and forwards, to cause the entangling of the fibres. The cap is formed in the same manner as wool hats, only the inlayer for stuff is a piece of wetted paper instead of cloth. When folded up in a wet cloth, it is worked on the hurdle in the same manner that other hats are on the bason, but without any heat except what is imparted by the hands or any subsequent sprinkling. After being thus basoned, without any boiling, they are immediately taken to the battery to undergo the operation of planking. In consequence of the superior smoothness of furs over wool, any softening material in the kettle is unnecessary : but it is indispensable that some substitute be made use of which will have an effect equivalent to boiling in the former case. For this purpose, wine lees were formerly in general use, but this has given place to sulphuric acid, which, from the smallness of the quantity made use of, is cheaper, and more easily obtained. About a wine-glassful of the acid is added to the kettle of patting it frequently with the brush. By this

sary to prevent its sprinkling over the operator: it is afterwards added in small quantities as it is found necessary. Into this bath the hat is first dipped, and then suffered to lie on the plank till cold again. This is called soaking, which is unnecessary in hats that are previously boiled.

It appears that the acid in caroting, boiling, and working at the plank must act as a chemical agent on the substance of the hairs, but in what way it does so is not understood : practical hatters seldom give themselves the trouble to think on the subject. M. Chaussier conjectures that it may produce, either by softening or swelling the hairs, a certain alteration which is necessary to bring about the cohesion of the different fibres. It is said that acid of any kind, by taking out the greasy substances on each pile of hair, allows the roughness on the surface of each to operate with their full effect, and thus facilitates the mechanical action of felting. The action of felting being promoted, however, by greasy substances, renders this last solution a little doubtful. Perhaps some kind of mucilaginous substance may be on the surface of the hairs, as conjectured by Mr. Nicholson, which is disengaged by the action of the acid.

Plated hats are an article of modern date : they are said to have been invented in the north of England within the last fifty years; and Lancashire and Cheshire are at present the principal seat of their manufacture. These are a middle class between cordies and stuffs, designed as a substitute for the latter at a more reasonable expense. To effect this purpose the different kinds of stuff are plated on wool bodies. But, in consequence of the looser texture and thicker substance of this kind of felt, a nap of much finer materials could not be laid on in the usual manner so as to appear to advantage ; it is found requisite therefore to have recourse to another expedient. The wool body, after it is boiled in about one part urine to three parts water, and has been worked sufficiently to complete the felting, is laid over a hair-cloth on the plank: the nap is then laid on the surface, sprinkled with a brush, and patted down. A layer of old stuff, or stuff which has its properties of felting destroyed, and carded cotton, or either of these separately, is bowed and laid on in the same manner, commonly mixed with a small portion of napping; and sometimes another layer is added. It is then slightly rolled a short time in the haircloth; but as the nap, by the process of rolling, would soon be lost by penetrating too deeply into the felt, it is discontinued, and the nap is fixed on by the operation of shaking and patting with the stopping-brush. The workman dips the article in the bath, and holding it by one of its edges between the forefinger and the thumb of each hand, strikes it down on the hair-cloth, at the same time depressing his hands in such a manner that the most distant edge may have an inclination given it to turn upwards, and thus after striking upon the cloth it is immediately raised off. This shaking is continued by repeated strokes in quick succession, frequently changing its position, and continuing the dipping, and water; in pouring in which great care is neces- process the hairs are just fixed in by the roots,

without sinking too deeply, and a long flowing nap is obtained. The cotton and old stuff during the operation, sticking on the body of the hat by means of the hot liquor, preserve the nap from flying off; at the same time, by enabling it to hold a greater body of the fluid, the work is facilitated, and the nap is also preserved from the continued action of the brush. When the nap is completely fastened, which will be in about half an hour, the cotton and old stuff are loosened by striking with a flat stick, and continuing the shaking. In a short time they will appear in a loose flake over the surface, which is taken off with the fingers whilst the nap remains fixed by the roots in the substance of the felt: the cotton and old stuff are dried and preserved for future use. In plating, as the bodies are first boiled, and as the nap laid on is of a soft, smooth, nature, nothing is made use of in the kettle but clean water. Best stuff, hares' wool, neuter wool, seal wool, or a mixture of any of the stuffs, are made use of according to the intended quality. Neuter wool has a short, neat appearance as a nap; seal-wool naps are much esteemed, and wear remarkably well: for the best plates, some beaver is added to the other stuffs made use of.

It has lately become a practice to unite the common method of napping with that of plating in stuff hats, which have the name of shakeoffs given them. After a slight nap is first rolled on, a second, and principal nap, is shaken on in the same manner as in plated hats. A shorter fur may in this manner be applied to advantage, or one of the usual length will produce a more showy nap.

Hats have been worn of various colors, but those most in use at present are black, drab, and white. The white hats, which are only intended for ladies and children, have a nap of rabbits' fur, selected from the white skins. Drab hats are also made of stuffs of the natural color, assorted for that purpose. In dyeing black, the articles now in general use are logwood, of which Campeachy was the best, copperas, and verdigris. French verdigris is far superior to the English. For dyeing common cordie hats, the general proportions for twelve dozen are about twenty-four pounds of logwood, seven of copperas, and a quarter of a pound of verdigris. The logwood is chipped, and left in the boiler to soak the preceding night; part of the copperas and verdigris is then added and boiled with the logwood. The hats are each fastened on a block with a string tied round the band and boiled in the liquor, sometimes turning those nearest the surface, and placing a weight upon them to keep them under the liquor. After boiling about an hour they are taken out and exposed to the air, while a fresh quantity is boiled in the kettle the same time as before. This boiling and airing is repeated several times according to the strength of the dye, the perfection required, or the nature of the materials to be dyed, as experience has shown that the action of the atmospheric air, or the oxygen it contains, very much contributes to improve the dye; the remainder of the copperas and verdigris is added in a decreased proportion to each snit.

Common hats that are easily dyed have now generally two suits only; best hats from three to four. On account of the high price of verdigris, sulphate of copper or blue vitriol is frequently made use of in dyeing common hats in a larger proportion, or a mixture of about equal parts of each. But those dyed with verdigris only have the brightest appearance after finishing. Atter dyeing, the hats are well washed in clean water.

After hats are dried, the next operation they undergo is that of stiffening. For the common purposes of stiffening, glue and vinegar dregs, beer grounds, or dregs from the distilleries are the articles made use of. The hat, for this purpose, is put into the crown of another large one, called the stiffening-hat, which is only felted and blocked, and has its crown slit open to admit the hat to be stiffened, of any depth the more readily. These are placed in the hole of a plank on which the brims are supported. The dregs are then first applied warm, with a brush similar to a large painting-brush, on the inside of the crown only; this is done by hold-ing the brush in the right-hand, while the lefthand, holding the brim of the stiffening-hat, continually turns it round, that the enclosed may be uniformly covered with the dregs. The dregs are made use of as they are the cheapest mucilage, and give a degree of firmness to the hat, at the same time preventing the glue from penetrating through to the surface. After this is dry, the glue is applied to the crown in the same manner, which is made in the proportion of about one pound of glue to three pints of water. After it is laid on with the brush, it is well rubbed round with the hand; for which purpose it is found expedient to employ a second person in the business, who receives the hat of the first person as fast as the glue is laid on with the brush. It was remarked that, in the first formation of the hat, the part designed for the band was laid thicker than any other; as this part has the most wear-as the wet is most likely to penetrate here—and as the general firmness of the hat depends on the strength of the band, it is likewise necessary to attend particularly to this part in the stiffening.

In stiffening a quantity of hats, the crowns only are thus attended to in the first place. In common hats, the grounds are frequently mixed with the glue, and laid on at the same time. The brims are next stiffened with a common soft brush, and glue only, which is applied to the This is well worked into the body underside. of the felt with the hand, and the hats are placed in a stove to dry. When dry, the nap on the underside of the brim will be glued down to the felt; this is removed from the surface by scouring it with a brush and a quantity of warm soap-suds, which are pressed out of the nap by the blunt edge of a wooden or copper stamper. Ladies' light hats, and some of the children's fancies, are stiffened with the application of starch, or common flour paste only.

In France the composition of gum arabic, common gum of that country, and Flanders' glue, are employed for the purpose of stiffening. The brittleness of gum arabic has been found an inconvenience, and a substitute has been sought for in some simple preparation from their indigenous plants. M. Chaussier observes, that mucilage is found in great quantity in many plants; it may easily be extracted by boiling; and a factitious gum, which is both supple and tenacious, may be formed by evaporation. These considerations led him to recommend, for the purpose of stiffening, a solution of glue in a strong and mucilaginous decoction of linseed. This preparation has been long used in the manufactory of the Cote d'or ; and is both more economical, and more conducive to the beauty of the work. Since that time, M. Margeron having communicated to him some observations respecting the mucilage which may be extracted from the leaves of the horse-chestnut tree, and having ascertained how great a quantity of mucilaginous and glutinous matter these leaves furnish, especially when the foliation is in full vigor, a solution of glue, in a strong decoction of them, has been used with great success. Perhaps this mucilage from the leaves of the horse-chestnut might be worthy the attention of the English hatmaker.

As glue is subject to the action of moisture, hats, stiffened with that material alone, are not perfectly water-proof. Several expedients have been devised to obviate this inconvenience : one of the methods, perhaps, most generally known, is that of balling. A ball is formed by melting about three parts resin, four parts bees-wax, and two parts mutton suet. This is frequently rubbed over the inside part of the hat while planking, particularly over that part which is to form the band. After balling, the hats are stiffened with glue in the usual manner.

In 1802 Messrs. Ovey and Jepsin, of London, obtained a patent for a method of water-proof stiffening. This was done by preparing a double hat; the under one was made of coarse materials, stiffened, and covered with a cement made of one pound and three quarters of flour, three quarts of water, one ounce of alum, and two ounces of resin; the latter was finely pulve-rised, and added while the rest was boiling; stirring it together until dissolved. The under part of the finer outside casing was also covered with the same, and then placed over the other, and united together by pressing with a cool Water-proof stiffening, particularly for iron. best hats, has lately been much attended to, and various are the methods employed by different manufacturers; but nothing appears to have so completely answered the purpose, and, at the same time to have been so advantageous in wearing, as that of stiffening with a solution of caoutchouc, or gum elastic. The exact method of the process is, at present, confined to a few hands, and industriously concealed from publicity.

The dry hat, after stiffening, is very rigid, and of an irregular figure; preparatory to finishing, therefore, it is fresh blocked. For this purpose it is necessary to soften the glue, which is done by the operation of steam. A hot iron is placed within a circular wooden frame, on which a wet cloth is thrown; the crown of the hat is then laid over the rising steam, whilst the brim rests

on the frame; and thus it is soon rendered sufficiently soft to receive the impression of a block of the intended size and shape. By the use of a hot iron, generally from twenty to twenty-five pounds in weight, a small card, brushes, &c., with the addition of water, the nap has the requisite direction given it, and receives its smoothness, and polish. Minute directions here are unnecessary; the judgment of the workman must be his principal director. It may not be useless to remark, that in watering the hats, which is done by a soft wetting brush for that purpose, the giving them plenty of water, and quickly passing a pretty hot iron over them, gives the glue a firmness and smartness, in which it will be deficient by more cautious wetting and more dilatory operations. If a little glue is accidentally drawn through the hat, by the heat of the iron, a wetted brush is laid on the iron a little to heat it sufficiently; and by the application of the warm, moist brush, and carding, it is soon extracted. Instead of water, oil was formerly used in finishing all descriptions of hats, and, for the coarsest sort of wool-hats, the practice has prevailed till very lately.

The instrument generally made use of for cutting the brims of round hats is merely a small worn-out card. At the outer edge a number of notches is cut for the purpose of inserting the point of a knife. The inner edge of the card, and the handle, is placed close to the crown of the hat, while on the block; and by placing the point of a knife in the proper notch, and drawing it round with the card, still keeping it close to the crown, the brim is evenly cut to any required dimensions. The hat is put in shape by curling the edges with the iron over a small rope for that purpose, stretching the hat out in an oval form by placing a screw or common stick across, and forming the brim with the hands while it is warm. The coarse hairs are picked out of the fine hats with a pair of steel pickers, and then given to be lined and bound; after which it receives the last finish, and is ready for the wearer.

Some years ago Mr. Hance, of Tooley Street Southwark, obtained a patent for a method of rendering beaver and other hats water-proof, which is thus described :---IIe takes a thin shell made of wool, hair, and fine beaver, to form the crown of the hat, and another shell, or plate, of the same materials for the brim. These parts are to be dyed black, and finished without glue or other stiffening, in order that they may not be injured by the rain, which, in other beaver hats, after being exposed to a heavy shower, draws out the glue and sticks down the nap, and makes it appear old and greasy. The shell may be made in one piece only, in the shape of the hat, blocked deep enough to admit of the brim being cut from the crown; the under side of the shell and the inside of the crown must then be made water-proof, by first laying on a coat of size or thin paste, strong enough to bear a coat of copal varnish, and, when thoroughly dry, another coat of boiled linseed oil. When dry, the crown must be put on a block, and a willow or cotton body or shape, woven on purpose, put into the inside of the crown and cemented in it. When dry, it

must be finished with a hot iron, and the crown is done. The brim must, in like manner, be cemented to a substance or body made with willow, or other fit material, sufficiently thick to make the inside of the brin. The brim and body are now to be pressed together, after which the under side of the brim may be covered with another shell of beaver or silk shag. The crown and brim are now to be sewed together: the edge of the brim must be oiled and varnished with copal-varnish and boiled linseed oil, to prevent any rain getting in. The cement used for sticking the parts together may be made with one pound of gum Senegal, one pound of starch, one pound of glue, and one ounce of bees'-wax, to be boiled in a quart of water. Hats made in this way, require only to be wiped dry after they have been exposed to the heaviest rain.

Hats are likewise made, for women's wear, of chips, straw, or cane, by platting, and sewing the plats together, beginning with the centre of the crown, and working round till the whole is finished. Hats, for the same purpose, are also woven, and made of horse-hair, silk, and other substances. See SILK and SATIN HATS, and STRAW.

STRAW. HATCH, v. a., v. n. & n. s. Saxon, cecan; HATCH'way, n. s. Serm. hecken, as Skinner thinks, from Sax. heghen, eghen, egg, egg. To produce young from eggs by incubation: to form, contrive, or bring to perfection; to disclose (from hacher, to cut); to shade lines in drawing: hatch, a brood excluded from the egg; a discovery, a preparation, from Sax. hæea; Dut. hecke, a bolt. A half door; a door with opening over it: perhaps from hacher, to cut, as a hatch is part of a door cut in two: also, in the plural, the doors or openings by which they descend from one deck or floor of a ship to another: hatches also signify floodgates.

Which thing they very well knew, and I doubt not will easily confess, who live both to their great toil, and grief, where the blasphemies of Arians are renewed by them; who, to hatch their heresy, have closen those churches as fittest nests where Athanasius's creed is not heard. Hooker.

There she's hid;

The mariners all under hatches stowed.

Shakspeare. Such as Agamemnon and the hand of Greece Should hold up high in brass! and such again As venerable Nestor, hatched in silver, Should with a bond of air, strong as the axle-tree On which heaven rides, knit all the Greeian ears To his experienced tongue. Id.

Something about, a little from the right, In at the window, or else o'er the hatch. Id.

Something's in his soul,

O'er which his melancholy sits on brood : And, I do doubt, the *hatch* and the disclose Will be some danger. *Id. Hamlet.* To the king's ship, invisible as thou art, There shalt thou find the mariners asleep

Under the hatches. Id. Tempest. He was a man harmless and faithful, and one who never hatched any hopes prejudicial to the king, but always intended his safety and honour. Hayward.

Who first shall wound, through others arms, his blood appearing fresh,

Shall win this sword, silvered and hatcht. Chapman.

He kindly spreads his spacious wing, And hatches plenty for the ensuing Spring.

Denham.

The tepid caves, and fens and shores, Their brood as numerous *hatch* from th' eggs, that scon

Bursting with kindly rapture, forth disclosed Their callow young. Milton.

He observed circumstances in eggs, whilst they were hatching, which varied. Boyle.

Those tender hairs, and those *hatching* strokes of the pencil, which make a kind of minced meat in painting, are never able to deceive the sight.

Dryden.

So, seas, impelled by winds with added power, Assault the sides, and o'er the hatches tower. Id.

A ship was fastened to the shore;

The plank was ready laid for safe ascent, For shelter there the trembling shadow bent, And skipped, and skulked, and under hatches went.

He assures us how this fatherhood continued its course, 'till the captivity in Egypt, and then the poor fatherhood was under *hatches*. Locke.

When they have laid such a number of eggs as they can conveniently cover and *hatch*, they give over, and begin to sit. Ray.

Others hatch their eggs, and tend the birth, 'till it is able to shift for itself. Addison.

HATCH, or HATCHWAY, a square or oblong opening in the deck of a ship, of which there are several, forming the passages from one deck to another, and into the hold or lower apartments.

HATCHEL, v. a. & v. n.) Germ. hachelen. HATCH'ELLER, n. s. See HACKLE. To beat flax, so as to separate the fibrous from the brittle part: the instrument with which it is done, and the person who performs the operation.

The asbestos, mentioned by Kircher in his description of China, put into water, moulders like clay, and is a fibrous small excressence, like hairs growing upon the stones; and for the *hatchelling*, spinning, and weaving it, he refers to his Mundus Subterraneus.

Woodward.

HAT'CHET, n.s. Fr. hache, hachetée ; HAT'CHET-FACE, n.s. Lat. ascia. A small axe. Hatchet-face, an ugly face, such perhaps as might be hewn out of a block by a hatchet ; it is sometimes also used for a thin, sharp physiognomy.

His harmful hatchet he hent in his hand,

And to the field he speedeth. Spenser. Ye shall have a hempen caudle then, and the help of a hatchet. Shakspeare. Henry VI. Nails, hammers, hatchets sharp, and halters strong.

Crashaw.

Tyrrheus, the foster-father of the beast, Then clenched a *hatchet* in his horny fist.

Dryden.

An ape his own dear image will embrace : An ugly beau adores a hatchet-face. Id.

The hatchet is to hew the irregularities of stuff. Maxon.

Our countryman presented him with a curious hatchet, and, asking him whether it had a good edge, tried it upon the donor. Addison.

HATCH/MENT, n. s. Corrupted from achievement. See ACHIEVEMENT. Armorial escutcheon placed over a door at a funeral. His means of death, his obscure funeral, No trophy, sword, nor *hatchment* o'er his bones, No noble rites nor formal ostentation, Crv to be heard. Shakspeare.

Cry to be heard. HATE, v. a. & n. s. HATE'FUL, adj. HATE'FULY, adv. HATE'FULYSS, n. s. H'TER, n. s. L'TER, n. s. H'TER, n. s.

Sax. bavian; Goth. hata; Swed. hat. To detest; to abhor; to abominate. These words are all expres-

HA'TRED, n. s. \int sive of a feeling contrary to love, and implying abhorrence, detestation, malignity, ill-will. Hateful is applicable either to the object or agent.

Those old inhabitants of thy holy land thou hatest for doing most odious works. Wisdom xii. 4.

You are, I think, assured I love you not.

- Your m2jesty hath no just cause to hate me. Shakspeare.

My name's Macbeth.

--- The devil himself could not pronounce a title More hateful to mine ear. Id.

Whilst he stood up and spoke,

He was my master, and I wore my life To spend upon his haters. Id.

Do all men kill the thing they do not love? --- Hates any man the thing he would not kill?

- Every offence is not a hate at first. Id.

I wish I had a cause to seek him there, To oppose his hatred fully. Id.

I of her understood of that most noble constancy, which whosoever loves not, shows himself to be a *hater* of virtue, and unworthy to live in the society of mankind. Sidney.

All their hearts stood hatefully appald Long since. Chapman.

What owe I to his commands

Who *hates* me, and hath hither thrust me down, To sit in *hateful* office here confined, Inhabitant of heaven, and heavenly born?

Milton.

I hear the tread

Of hateful steps; I must be viewless now. Id. The only righteous in a world perverse

And therefore hated. Id. Paradise Lost. An enemy to God, and a hater of all good.

Palamon, compelled

Browne.

No more to try the fortune of the field ;

And, worse than death, to view with hateful eyes His rival's conquest. Dryden.

Hate to Mczentius, armed five hundred more. Id. But whatsoever our jarring fortunes prove,

Though our lords hate, methinks we two may love.

Hatreds are often begotten from slight and almost innocent occasions, and quarrels propagated in the world. Locke.

Hatred is the thought of the pain which any thing present or absent is apt to produce in us. Id.

Hatred is the passion of defiance, and there is a kind of aversation and hostility included in its very essence; but then, if there could have been hatred in the world when there was scarce any thing odious, it would have acted within the compass of its proper object. South.

They never wanted so much knowledge as to inform and convince them of the unlawfulness of a man's being a murderer, an *hater* of God, and a covenant-breaker. *Id.*

Hatred has in it the guilt of murder, and lust the guilt of adultery. Sherlock.

Retain no malice nor *hatred* against any : be ready to do them all the kindness you are able. *Wake*. But Umbriel, *hateful* gnome ! forbears not so; He breaks the phial whence the sorrows flow. *Pope*.

She is a Presbyterian of the most rank and virulent kind, and consequently has an inveterate hatred to the church. Swift.

Nausicaa teaches, that the afflicted are not always the objects of divine *hate*.

Broome's Notes on the Odyssey.

Why dost thou shun the salt? that sacred pledge, Which, once partaken, blunts the sabre's edge, Makes even contending tribes in peace unite, And hated hosts seem brethren to the sight.

Byron, Corsair.

HATFIELD, or BISHOP'S HATFIELD, a market town of Hertfordshire, nineteen miles and a half north of London. It was called Bishop's Hatfield, because it belonged to the Bishop of Ely. Theodore, archbishop of Canterbury, held a synod in it, A.D. 681, against the Eutychian heresy. It had once a royal palace, wherein prince William, son of Edward III., was born, and whence Edward VI. and queen Elizabeth were conducted to the throne. King James I. exchanged the manor with Sir Robert Cecil, afterwards lord Salisbury, for Theobalds; and the lordship still remains in that noble family, who have a fine seat here. The rectory is reckoned worth £800 Here are two charity schools, and a a-year. market on Thursdays, with fairs in April and Hatfield is seven miles W.S.W. of October. Hertford.

HATFIELD BROAD OAK, HATFIELD REGIS, or KING'S HATFIELD, a town of Essex, seated on a branch of the Lea, twenty-nine miles N. N. E. of London; so called from its tenure by king William the Conqueror and his successors, and from a broad oak growing in the town. The church is an ancient Gothic structure, having a curious monument and cross-legged effigy to the memory of Robert Vere, the first earl of Oxford, lord high chamberlain of England. A priory of black canons was founded here by his ancestors. It formerly had a market on Saturday. It lies eight miles south-west of Dunmow.

HATHAZ, a town of Hungary, in the county of Szabolcs, belonging to the tribe of Haiduks, and containing 4000 inhabitants, chiefly Calvinists. Eleven miles north of Debreczin.

HATHERLEIGH, a town of Devonshire, near the conflux of the Towridge and Ock. It has a considerable woollen manufacture, and markets on Tuesday and Friday. It is twenty-eight miles W. N. W. of Exeter, and 201 west of London.

HATTEMISTS, in ecclesiastical history, a modern Dutch sect, so called from Pontian Van Hattem, a minister in Zealand, towards the close of the seventeenth century, who, being addicted to the sentiments of Spinoza, was degraded from his pastoral office. The Verschorists and Hattemists resemble each other in their religious systems, though they never formed one communion. The founders of these sects deduced from the doctrine of absolute decrees a system of uncontrollable necessity; they denied the difference between moral good and evil, and the corruption of human nature : whence they concluded, that mankind were under no obligation to correct their manners, improve their minds, of

75

obey the divine laws; that the whole of religion consisted not in acting, but in suffering; and that all the precepts of Jesus Christ are reducible to this one, that we bear with cheerfulness and patience the events that happen to us through the divine will, and make it our constant and only study to maintain a permanent tranquillity of mind. Thus far they agreed; but the Hattemists farther affirmed, that Christ made no expiation for the sins of men by his death, but had only suggested to us by his mediation, that there was nothing in us that could offend the Deity; this, they say, was Christ's manner of justifying his servants, and presenting them blameless before the tribunal of God. It was one of their distinguishing tenets, that God does not punish men for their sins, but by their sins. These two sects, says Mosheim, still subsist, though they no longer bear the names of their founders.

HA'TTER, v. a. Perhaps corrupted from batter. To harass; to weary; to wear out with fatigue.

He's hattered out with penance.

Dryden.

76

HATTERAS CAPE, one of the most dangerous and most remarkable capes on the coast of the United States, North America: it is the salient point of the sand-bank that encloses Pamlico Sound, North Carolina, in N. lat. 35° 15'. Off the cape is a cluster of shoals, at the distance of five leagues, with channels within them. In bad weather the combined forces of the gulf stream, and the winds, produce the most tremendous breakers on these shoals; but in fair weather they may be sailed over by vessels of eight or nine feet. Their seaward, or exterior edge, goes off perpendicularly from ten fathoms to no soundings, and by a comparison of the old and modern charts they seem to have greatly decreased. A little north of Cape Hatteras, with the wind off shore, a boat may land and procure fresh water by digging a foot or two deep in the sand of the beach.

HATTIA ISLE, a low island of Bengal, formed by the mud of the great rivers Brahmapootra and Ganges, at their junction with the ocean in Bengal Bay. In length it is about fourteen miles, by ten the average breadth. At spring tides, during the rains, it is nearly submerged. Salt of an excellent quality is manufactured here for the company.

HAVANNAH, a city of the West Indies, the capital of the Island of Cuba, is situated on the north coast, at the mouth of the Lagida. Its port is capable of containing 1000 ships in perfect shelter; the depth generally six fathoms. The entrance is by a passage one mile and a half long, and very narrow, and three large ships have been sunk in it to render it more difficult. It is defended by the Morro Castle on the east, and by the fort of Punta on the west. The Morro is situated on an elevation that renders it impossible to cannonade it from shipping; it consists of two bastions towards the sea, and two towards the land, with a covered way and deep ditch cut in the rock, and can bring many guns to bear on the entrance of the harbour. Punta fort is situated on a low point, and forms a square, with casemates, and a ditch cut in the rock. The other fortifications are numerous and

formidable. The city is on the west side of the port. When old Spain preserved the command of her colonies, the annual fleet sailed from the Havannah in September, and, besides merchandise, it usually conveyed 30,000,000 of piastres in coin. A packet sailed from Corunna to the Havannah and Porto Rico every month. The city contains eleven churches, two hospitals, a dock-yard, lazaretto, and numerous public buildings; an aqueduct supplies the shipping with water, and turns the saw-mills in the dock-yard. The houses, which are elegant, are mostly of stone. There are several convents; and the great square is a fine ornament to the place. The churches are magnificently ornamented with gold and silver lamps, images, &c. The manners of the inhabitants are said to be polished, and they have societies for the encouragement of the arts and sciences. The importance of this city and harbour has caused it to be repeatedly attacked. In 1536 it was taken by a French pirate, but ransomed for 700 dollars; it was again taken by the English, and by the French, and by the Buccaneers; but the most memorable attack was that by the British in 1762. Admiral Sir George Pococke and lord Albemarle conducted a fleet and troops to the Havannah; and after a determined resistance of two months and eight days, on the 14th of August, the Moro Castle and place surrendered, as well as a district of 180 miles to the west of the town. The victors captured nine sail of the line; three more were sunk by the Spaniards; two on the stocks were burnt; and a great many merchant vessels completed the spoil. The merchandise and specie found in the place was supposed to amount in value to £3,000,000 sterling. This city was restored to Spain at the peace of 1763; since which the government has been often employed in increasing its strength The trade is computed to and resources. amount, by importations (the exportations being chiefly in sugar, wax, and coffee), to £20,000,000 of piastres. Population 25,000.

HAU'BERK, n. s. Old Fr. hauberg. A coat of mail; a breast-plate.

and at the last
The statue of Mars began his hauberke ring;
And with that soun he heard a murmuring
Full low and dim, that sayde thus Victorie,
For which he yaf to Mars honour and glorie.
Chaucer. The Knightes Tale.
And over that a fin hauberk
Was all ywrought of jewes work,
Ful strong it was of plate.
Id. The Rime of Sire Thopas.
Him on the hauberk struck the princess sore,
That awing disported all the linked frame

That quite disparted all the linked i And pierced to the skin.

Faerie Queene. Hauberks and helms are hewed with many a wound ; The mighty maces with such haste descend, They break the bones, and make the solid armour

Dryden. bend.

HAVE, v. a. in the present I have, thou hast, he hath; we, ye, they have ; pret. and part. pass. had. Sax. rabban; Fr. avoir; Ital. avcre; Goth. haban; Dut. hebben. In the Mæso-Goth. we have haba and habaith; whose progress a aga, aha, ha, hava, says Mr. Thomson, was easily traced to the Latin habeo.

Not to be without.

I have brought him before you, that after examination had, I might have something to write.

Acts xxv. 26.

To carry; to wear.

Upon the mast they saw a young man, who sat as ou horseback, *having* nothing upon him. Sidney.

To make use of.

I have no Levite to my priest. Judges. To possess.

He that gathered much had nothing over, and he that gathered little had no lack. Exod. xvi. 18.

He that his hand wol put in this mitaine,

He shal have multiplying of his graine.

Chaucer. The Pardoneres Tale.

To obtain; to enjoy; to possess.

Now, O Father, glorify me with thine own self, with the glory which I had with thee before the world was. John xvii. 5.

To take; to receive.

A secret happiness in Petronius is called curiosa felicitas, and which I suppose he had from the feliciter audere of Horace. Dryden.

To be in any state; to be attended with or united to as accident or concomitant.

Have I need of madmen, that ye have brought this fellow? 1 Sam. xxi. 15.

To put; to take.

That done, go and cart it, and have it away. Tusser.

To procure; to find.

I would have any one name to me that tongue, that one can speak as he should do, by the rules of grammar. Locke.

Not to neglect; not to omit.

Have mercie on our woe and our distresse Some drope of pitee thurgh thy gentillesse Upon us wretched wimmen let now falle.

Chaucer. The Knightes Tale.

I cannot speak, if my heart be not ready to burst. ---Well, sweet Jack, have a care of thyself.

Shakspeare.

Your plea is good ; but still I say beware : Laws are explained by men ; so have a care. Pope.

Of the maid servants shall I be had in honour. 2 Sam.

The proud have had me greatly in derision.

Psalms.

Bacon.

To maintain; to hold opinion.

To hold; to regard.

Sometimes they will have them to be natural heat, whereas some of them are crude and cold; and sometimes they will have them to be qualities of the tangible parts, whereas they are things by themselves.

To contain.

You have of these pedlars that have more in them than you think, sister. Shakspeare.

I will never trust a man again for kccping his sword clean; nor helieve he can have every thing in him by wearing his apparel neatly. Id.

To require; to claim.

 What would these madmen have ?
 .

 First they would bribe us without pence,
 Deceive us without common sense,

 And without power enslave.
 Dryden.

To be a husband or wife to another.

If I had been married to him, for all he was in woman's apparel, I would not have had him. Shakspeare. To be engaged, as in a task or employment. If we maintain things that are established, we have to strive with a number of heavy prejudices, deeply rooted in the hearts of men. *Hooker*.

The Spaniard's captain never hath to meddle with his soldiers' pay. Spenser on Ireland. Of the evils which hindered the peace and good

ordering of that land, the iuconvenience of the laws was the first which you had in hand. Spenser.

Kings have to deal with their neighbours, their wives, their children, their prelates or clergy, their nobles, their merchants, and their commons. Bacon.

To wish; to desire; in a lax sense.

To buy.

I had rather be a door-keeper in the house of my God, than to dwell in the tents of wickedness.

Psalms.

I would have no man discouraged with that kind of life or series of actions, in which the choice of others, or his own necessities may have engaged him.

Addison.

If these trifles were rated only by art and artfulness, we should have them much cheaper. Collier.

It is most used in English, as in other European languages, as an auxiliary verb to make the tenses; have, hast, and hath, or has, the preterperfect; and had, and hadst, the preterpluperfect.

If there had been words enow between them to have expressed provocation, they had gone together by the ears. Congreve.

I have heard one of the greatest geniuses this age has produced, who had been trained up in all the polite studies of antiquity, assure me, upon his being obliged to search into records, that he at last took an incredible pleasure in it. Addison.

I have not here considered custom as it makes things easy, but as it renders them delightful; and, though others have made the same reflections, it is possible they may not have drawn those uses from it. Id.

That admirable precept which Pythagoras is said to hav given to his disciples, and which that philosopher must have drawn from the observation I have enlarged upon. Id.

The gods have placed labour before virtue. Id.

This observation we have made on man. Id. Evil spirits have contracted in the body habits of

lust and sensuality, malice, and revenge. Id. Their torments have already taken root in them. Id.

That excellent author *has* shown how every particular custom and habit of virtue will, in its own nature, produce the heaven, or a state of happiness, in him who shall hereafter practise it. *Id.*

Have at, or with, is an expression denoting resolution to make some attempt. They seem to be imperative expressions; have this at you; let this reach you; or take this; have with you; take this with you; but this will not explain have at it, or have at him, which must be considered as more elliptical; as, we will have a trial at it, or at him.

He that will caper with me for a thousand marks, let him lend me the money, and have at him.

Shakspcare.

I never was out at a mad frolick, though this is the maddest I ever undertook; have with you lady mine; I take you at your word. Dryden.

I can hear my part ; 'tis my occupation : have at it with you. Id.

HAVEL, a navigable river of the north of Germany, which rises in the duchy of Mecklenburg, near Klatzeberg, joins the Spree near Spandau, passes by Old and New Brandenburg, and falls into the Elbe below Havelberg. It flows through a number of lakes, and often overflows its banks.

HA'VEN, n. s. Fr. havre; Dut. haven. HA'VENER, n. s A port; harbour; a station for ships; the overseer of a port; and figuratively a shelter or asylum.

Hardy he wos and wise, I undertake : With many a tempest hadde his berd beshake, He knew wel alle the *havens* as they were, Fro Gotland to the Cape de Finistere, And every creke in Bretagne and in Spain : His barge ycleped wos the Magdelaine.

Chancer. Prologue to Canterbury Tales. Order for sea is given :

They have put forth the haven.

Shakspeare.

All places that the eye of heaven visits, Are to a wise man ports and happy havens. Id. After an hour and a half sailing, we entered into

a good haven, being the port of a fair city. Bacon. These earls and dukes appointed their special officers, as receiver, havener, and customer. Carew.

The queen beheld, as soon as day appeared,

The navy under sail, the haven cleared. Denham.

Love was threatened and promised to him, and his cousin, as both the tempest and haven of their best years. Sidney.

We may be shipwrecked by her breath :

Love, favoured once with that sweet gale,

Doubles his haste, and fills his sail,

'Till he arrives, where she must prove

The haven, or the rock of love. Waller.

HAVER, n. s. From have. Possessor; holder.

Valour is the chiefest virtue, and

Most dignifies the haver. Shakspeare. IIA'VER is a common word in the northern countries for oats; as, haver bread for oaten bread; perhaps properly aven, from Latin avena.

When you would anneal, take a blue stone, such as they make *haver* or oat cakes upon, and lay it upon the cross bars of iron. *Peacham*.

HAVERCAMP (Sigibert), a celebrated Dutch scholar and critic, professor of history, eloquence, and Greek, at Leyden. He was the author of some esteemed works on medals; and published elegant editions of several Greek and Latin authors. He died at Leyden, in 1742, aged fifty-eight.

HAVERFORDWEST, a neat, well-built, and populous town of South Wales, in Pembrokeshire, on the side of the hill, which forms a part of the west bank of the Dongledye, 252 miles from London. It is an incorporated town and county of itself, governed by a mayor, sheriff, town-clerk, two bailiffs, and other officers The mayor is admiral, coroner, escheater, and clerk of the markets. The people enjoy a good trade. The town enjoys several privileges, and has its own courts: and the county assizes are held in it. It has four churches, a commodious quay for ships of burden, a custom-house, and a fine stone bridge over the Dongledye, with a good free-school, a charity school, and an alms-house.

HAVEL, a navigable river of the north of It was formerly fortified with a rampart and ermany, which rises in the duchy of Meck- castle, now demolished.

HAVERIHILL, a post town of Massachusetts, in Essex county, on the north side of the Merrimack; over which is an elegant bridge with three arches, connecting it with Bradford, 650 feet long, and thirty-four broad. It contained 2408 inhabitants in 1795; and lies thirty-two miles north by west of Boston, and 380 from Philadelphia. Long. 3° 58' E. of that city, lat. 42° 46' N.

HAVERHILL, a town of New Hampshire, capital of Grafton county, on the east side of the Connecticut, opposite Newbury, thirty-two miles above Dartmouth College, and 496 northeast of Philadelphia. Long. 3° 5' E., of that city, lat. 44° 6' N.

HAVERIFILL, a post town of Grafton county, New Hampshire, on the Connecticut, opposite Newbury, with which it is connected by a bridge; twenty-seven miles north of Dartmouth College, thirty-one N. N. W. of Plymouth, 119 north-west of Portsmouth, and 522 from Washington. In the south-west part of the town there are a court house, gaol, academy, and a congregational meeting-house : it is a place of considerable business. The courts for the county are held alternately here and at Plymouth.

HAVERHILL, a post town of Essex county, Massachusetts, at the head of a navigation on the north side of the Merrimack, eighteen miles from its mouth, opposite Bradford ; fifteen miles W.S.W. of Newburyport, eighteen S.S.W. of Exeter, nineteen N.N.W. of Salem, thirty north of Boston. It is a pleasant, handsome, and flourishing town, and contains a bank, two cotton and woollen manufactories, two printing offices, from one of which a weekly paper is issued, a public library, and four houses of public worship, three for Congregationalists, and one for Baptists. The compact part of the town is built on the declivity of a hill, in two streets, the principal of which runs parallel with the river. A number of the houses are elegant; and it has considerable manufactures of leather, hats, plated ware, and shoes. Considerable ship-building business is done here. The river is navigable for vessels of 100 tons. Here is an elegant bridge across the Merrimack connecting Haverhill with Bradford, with three arches of 180 feet each, supported by three handsome stone piers, forty feet square.

HAVERILL, a town of England, partly in Essex, and partly in Suffolk. It has a considerable manufactory of checks, cottons, and fustians. It is twenty miles south-east of Cambridge, and fifty-nine N. N. E. of London.

HAUGHT, adj.	Fr. haut, hautaine,
HAUGHT'ILY, adv.	from Lat. altus. High;
HAUGHT'INESS, n. s.	lofty; proud; imperi-
	ous; insolent; bold;
generally descriptive of	carriage or behaviour.

There is no lady so hauteine Duchesse, countesse, ne chastelaine, That I n'olde holde her ungodely For to refuse him utterly. Chaucer, Romaunt of the Rose. His courage haught.

Desned of foreign foemen to be known, And far abroad for strange adventures sought. Spenser.

Who now shall give me words and sound

Equal unto this haughty enterprize ?

Or who shall lend me wings, with which from ground

My lowly verse may loftily arise? Faerie Queene. The proud insulting queen,

With Clifford and the haught Northumberland, Have wrought the easy melting king, like wax.

Shakspeare. No lord of thine, thou haught insulting man; Nor no man's lord.

His wife being a woman of a haughty and imperious nature, and of a wit superior to his, quickly resented the disrespect she received from him. Clarendon.

Before the cloudy van

On the rough edge of battle ere it joined, Satan with vast and haughty strides advanced, Came towering armed in adamant and gold. Milton.

I shall sing of hattles, blood and rage, And haughty souls, that, moved with mutual hate, In fighting fields pursued and found their fate. Dryden.

79

Her heavenly form too haughtily she prized ; Id. His person hated, and his gifts despised. By the head we make known our supplications, our threatnings, our mildness, our haughtiness, our love, and our hatred. Id.

Our vanquished wills that pleasing force obey ; Her goodness takes our liberty away. And haughty Britain yields to arbitrary sway.

Prior.

When mannakins with haughty step advance And grasp the shield, and couch the ouivering lance. Beattie.

The crag is won-no more is seen His Christian crest and haughty mien.

The Giaour. Byron. Still one great clime in full and free defiance Yet rears her crest ; unconquered and sublime, Above the far Atlantic !--- She has taught

Her Esau brethren, that the haughty flag,

The floating fence of Albin's feeble crag,

May strike to those whose red right hands have bought Rights cheaply earned with blood. Byron.

HA'VING, n. s. From have. Possession; estate; fortune.

My having is not much ;

I'll make division of my present with you ;

Hold, there's half my coffer. Shakspeare. The act or state of possessing.

Of the one side was alledged the having a picture, which the other wanted ; of the other side, the first striking the shield. Sidney.

Thou art not for the fashion of these times, Where none will sweat but for promotion ; And having that, do choak their service up, Even with the having.

Shakspeare. As You Like It.

Behaviour; regularity. This is still retained in the Scottish dialcct. It may possibly be the meaning here.

The gentleman is of no having : he kept company with the wild prince and Poins : he is of too high a region : he knoweth too much. Shakspeare.

HA'VIOUR, n. s. For behaviour Conduct; manners. Not used.

HAU

Their ill haviour garres men missay Both of their doctrines and their fay.

Spenser.

HAUKSBEE (F.), an English electrician of the last century, who first observed that a glass tube closed at one end and rendered electric by friction attracted from a certain distance metallic leaves, and again forcibly repelled them. He made many other experiments, the details of which are published in the Transactions of the Royal Society, and collected his discoveries in his Physico-mechanical Experiments, on various subjects, touching light and electricity, producible on the attraction of bodies: with an explanation of all the apparatus used in the experiments; London, 1709, 4to. republished in 1719, and translated into Italian and French. He also wrote Proposals for a Course of Chemical Experiments, London, 1731, 4to.; and An Essay for introducing a Portable Laboratory, 1731, 8vo. The time of his death is unknown.

HAUL, v. u. & n. s. Fr. haler. To pull; to draw; to drag by violence. A word which, applied to things, implies violence; and to per-sons, awkwardness or rudeness. This word is liberally exemplified in hale; etymology is regarded in hale, and pronunciation in haul.

Thy Dol, and Helen of thy noble thoughts, Is in base durance and contagious prison, Hauled thither by mechanick dirty hands.

Shakspeare.

The youth with songs and rhimes

Some dance, some haul the rope. Denham. Some the wheels prepare,

And fasten to the horses feet;

With cables haul along the' unwieldy beast.

Dryden.

Thither they bent, and hauled their ships to land ; The crooked keel divides the yellow sand. Pope. In his grandeur he naturally chuses to haul up

others after him whose accomplishments most resemtle his own. Swift. Romp-loving miss

Is hauled about in gallantry robust.

Thomson.

Id.

The leap, the slap, the haul.

To HAUL, among seamen, implies to pull a single rope, without the assistance of blocks or other mechanical powers. When a rope is otherwise pulled, as by the application of tackles, or the connexion with blocks, &c., the term is changed into bowsing.

To HAUL THE WIND is to direct the ship's course nearer to that point of the compass from which the wind arises. Thus, supposing a ship to sail south-west with the wind northerly, and some particular occasion requires to haul the wind more westward; to perform this operation, it is necessary to arrange the sails more obliquely with her keel; to brace the yards more forward, by slackening the starboard and pulling in the larboard braces, and to haul the lower sheets further aft; and, finally, to put the helm a-port, i. e. over to the larboard side of the vessel. As soon as her head is turned directly to the westward, and her sails are trimmed accordingly, she is said to have hauled the wind four points; that is to say, from south-west to west. She may still go two points nearer to the direction of the wind, by disposing her sails according to their greatest obliquity, or, in the sea phrase, by trimming all sharp; and in this situation she is said to be close hauled, as sailing W. N. W.

HAUM, IIAME, or HALM, n. s. Sax. healm; Dut. and Dan. halm. Straw.

In champion countrie a pleasure they take

To mow up their haume for to brew and to bake :

The *haume* is the straw of the wheat or the rie, Which once being reaped, they mow by and by.

Tusser.

Having stripped off the *haum* or binds from the poles, as you pick the hops, stack them up.

Mortimer.

HAUNCH, n. s. Fr. hanche; Dut. hancke; Ital. anca. The thigh; the hind hip; the rear; the hind part.

Hail, groom ! didst thou not see a bleeding hind, Whose right haunch earst my stedfast arrow strake ? Spenser.

Thou art a summer bird.

Which ever in the haunch of Winter sings

The lifting up of day. Shakspeare.

To make a man able to teach his horse to stop and turn quick, and to rest on his *haunches*, is of use to a gentleman both in peace and war. Locke.

The HAUNCHES OF A HORSE are too long, if when standing in the stable he limps, with his hind legs farther back than he ought; and when the top of his tail is not in a perpendicular line to the tip of his hocks, as it always is in horses whose haunches are of a just length. Some horses, though they have too long haunches, yet commonly walk well: such are good to climb hills, but are not at all sure upon a descent; for they cannot ply their hams, and never gallop slowly, but always nearly upon a full speed. The art of riding has not a more necessary lesson than that of putting a horse upon his haunches; which is called coupling him well, or putting him well together, or compact. A horse that cannot bend or lower his haunches, throws himself too much upon his shoulder, and lies heavy upon the bridle.

HAUNT, v. a., v. n. & n.s. Fr. hanter. To HAUNTER, n.s. frequent or be much about any place or person, always used in a bad sense: a practice or habit; a place in which one is frequently found, for bad purposes or deeds; an unwelcome visitor: it is especially used with reference to spectres and apparitions.

A good wif was there of beside Bathe; But she was som del defe, and that was scathe. Of eloth making she had swiche an haunt, She passed hem of Ipres, and of Gaunt.

Chaucer. Prologue to Canterbury Tales. That other marchandise,---that men haunten with fraude, and trecherie, and deccit, with lesinges and false othes,---is right cursed.

Id. The Persones Tale.

There now he lives in everlasting ioy

With many of the gods in company,

Which the the *haunt*, and with the winged boy, Sporting himselfe in safe felicity.

Spenser. Faerie Queene. I've charged thee not to haunt about my doors : In honest plainness thou hast heard me say,

My daughter's not for thec. Shakspeare. Othello. Where they most breed and haunt I have observed The air is delicate. Id. Macbeth. HAV

Foul spirits haunt my resting place,

And ghastly visions break my sleep by night. Fairfax.

The ancient Grecians were an ingenious people, of whom the vulgar sort, such as were haunters of theatres, took pleasure in the conceits of Aristophanes.

Wotton on Education.

Earth now

Secured like to heaven, a seat where gods might dwell,

Or wander with delight, and love to haunt Her sacred shades. Milton.

A man who for his hospitality is so much haunted, that no news stir but come to his ears. Sidney.

Now we being brought known unto her, after once we were acquainted, and acquainted we were sooner than ourselves expected, she continually almost haunted us. Id.

She this dangerous forest haunts

And in sad accents utters her complaints.

Waller.

O goddess, haunter of the woodland green, Queen of the nether skies ! Dryden.

We set toils, nets, gins, snares, and traps, for beasts and birds in their own *haunts* and walks.

L'Estrange.

To me pertains not, she replies,

To know or care where Cupid flies;

What are his haunts, or which his way,

Where he would dwell, or whither stray. Prior.

The *haunt* you have got about the courts will one day or another bring your family to beggary.

Arbuthnot.

A scene where, if a god should cast his sight, A god might gaze and wonder with delight! Joy touched the messenger of heaven; he stayed, Entranced, and all the blissful *haunts* surveyed.

Pope.

Celestial Venus haunts Idalia's groves ; Diana Cynthus, Ceres Hybla loves. Id.

All these the woes of Oedipus have known, You fates, you furies, and your *haunted* town.

Id.

Oh, could I see my country seat! There leaning near a gentle brook, Sleep, or peruse some ancient book;

And there in sweet oblivion drown

Those cares that haunt the court and town.

Swift.

Through glades and glooms the mingled measure stole,

Or o'er some haunted stream with fond delay,

Round an holy calm diffusing,

Love of peace and lonely musing

In hollow murmurs died away. Collins' Odes. Or when the setting Moon in crimson dyed Hung o'er the dark and melancholy deep, To haunted stream remote from man he hied, Where fays of yore their revels wont to keep.

Beattie.

----- Ye, to whom the tops

Of mountains inaccessible are haunts,

And earth's and ocean's caves familiar things-

I call upon ye by the written charm which gives me power upon you-Rise! appear!

Byron. Manfred.

HAV'OCK, n.s., interj. & v. a. Welsh, hafog; from Goth. havega, to destroy. Devastation, waste, and ruin: to lay waste or destroy. Havock, the interjection, is an old word of encouragement to slaughter.

Saul made havock of the church.

Acts viii. 3.

Having been never used to have any thing of their own, they make no spare of any thing, but havock and confusion of all they meet with. Spenser.

Whatsoever they leave, the soldier spoileth and havocketh; so that, between both, nothing is left.

81

Why stand these royal fronts amazed thus ? Cry, Havock, kings ! Shakspeare. Ate by his side,

Cries, Havock ! and lets loose the dogs of war. Id. See, with what heat these dogs of hell advance,

To waste and havock yonder world, which I S) fair and good created ! Milton.

The Rabbins, to express the great havock which has been made of the Jews, tell us, that there were such orrents of holy blood shed, as carried rocks of a hundred yards in circumference above three miles Addison. into the sea.

Ye gods ! what havock does ambition make Id. Cato. Among your works !

If it had either air or fuel, it must make a greater havock than any history mentions. Cheyne.

HAVRE DE GRACE, a commercial sea-port of France, is seated on the right bank of the Seine, one league from Cape La Heve. It is built on an acclivity between two hills; and is surrounded by high walls, with ditches and a citadel. Its harbour dries at low water : it has twelve feet in common tides, and twenty-five in high springs. It has also the singular advantage that the tide does not begin to fall until three hours after high water; the cause of which seems to be, that the current of the Seine, crossing the harbour's mouth with great force at the beginning of the ebb, confines the water in the harbour. It has 20,000 inhabitants, and is a maritime prefecture. The favorable situation of Havre, communicating with Paris by the Seine, renders it extremely commercial. Before the late war it had a considerable West India trade, and a number of vessels in the Greenland and Newfoundland fisheries. The passage from Southampton to Havre being much frequented, the latter is often the first French town that meets the eye of an Englishman; and, though not inferior to most places of its size, is confined and dirty in appearance. The streets are narrow, and formed of high wooden-framed houses: there are no public buildings of importance. As Normandy is a corn country there is a frequent export of that article, particularly to the southern provinces of France. The merchandise taken back by foreigners from Havre consists in colonial produce, woollen and linen, corn, cyder, and fruits. Havre is much frequented by French coasters from the west and south. The manufactures, which are on a small scale, are sail-cloth, cordage, tobacco, lace, and earthenware. That of tobacco is of old standing. Here are also several building docks, and a sugar refinery. Havre was put into a state of defence in the reign of Francis L.; but its fortifications were brought to their present perfection under Buonaparte. To his government it likewise owes several improvements in the harbour and docks, and the erection of two light-houses, on a perpendicular cliff about a league from the town. It was bombarded by the British in 1759, 1794, and 1795. It is forty-five miles west of Rouen, and 112 north-west of Paris.

VOL. XI.

HAURIANT, in heraldry, a term peculiar to fishes; signifying their standing upright, as if refreshing themselves by sucking in the air. See HERALDRY.

HAURUCA ISLE, one of the Amboyna Isles, a small island in the eastern seas, about twenty-five miles in circumference. Long. 128° 40' E. lat. 3° 40' S.

HAUSRUCKVIERTEL, i.e. the Quarter of Hausrude, a circle of Upper Austria, bounded by the Danube, the circle of the Traun, and Bavaria. It was formerly of more than double its present extent of about 733 square miles; for, after the disastrous campaign of 1809, the western part was ceded to Bavaria. This district is named after the Hausruck, a mountain and great forest within its circuit. The most remarkable circumstance here is a subterraneous bed of wood, impregnated with bituminous matter. Wood deposited in the shafts of the mines becomes speedily impregnated with bitumen. In the summer of 1817, part of the mountain having fallen in, its place was occupied by a lake: ten cottages on the verge of the mountain were destroyed, but no lives lost. Population 109,000. The capital is Lintz.

HA'UTBOY, n. s. Fr. oboe, or haut and bois. A wind instrument.

I told John of Gaunt he beat his own name; for you might have trussed him and all his apparel into an eel-skin : the case of a treble hautboy was a mansion for him. Shakspeare.

Now give the hautboys breath ; he comes, he comes. Dryden.

The HAUTBOY is shaped much like the lute; only it spreads and widens towards the bottom, and is sounded through a reed. The treble is two feet long; the tenor goes a fifth lower when blown open: it has only eight holes; but the bass, which is five feet long, has eleven. The name is French, haut bois, q. d. high wood ; and is given to this instrument because the tone of it is higher than that of the violin.

HAUTBOY STRAWBERRY. See FRAGARIA and STRAWBERRY.

HAUTE FEUILLE (John), an ingenious mechanic, born at Orleans in 1647. Though he was an ecclesiastic, and enjoyed several benefices, he applied almost his whole life to mechanics, in which he made a great progress. He had a particular taste for clock-work, and made several discoveries in it that were of singular use. He found out the secret of moderating the vibration of the balance by means of a small steel spring, which has since been made use of. This discovery he laid before the members of the Academy of Sciences, in 1674; and these watches are called pendulum watches, not that they have real pendulums, but because they nearly approach to the justness of pendulums. M. Huygens perfected this happy invention; but having declared himself the inventor, and obtained from Louis XIV. a patent for making watches with spiral springs, the abbé Feuille opposed the registering this privilege, and published a piece on the subject against M. Huygens. He wrote a great number of other pieces, most of which are small pamphlets consisting of a few pages, but very curious; as, 1. The Perpetual Pendulum; 4to.

G

2. New Inventions; 4to. 3. The Art of Breathing under Water, and the Means of preserving a Flame shut up in a small Place. 4. Reflections on Machines for raising Water. 5. On the different Sentiments of Malebranche and Regis, relating to the appearance of the Moon when seen in the Horizon. 6. The Magnetic Balance. 7. A Placet to the King on the Longitude. 8. Letter on the Secret of the Longitude. 9. A New System on the Flux and Reflux of the Sea. 10. The Means of making sensible Expeiments that prove the Motion of the Earth; and many other pieces. Ile died in 1724.

HAUY (Rene Just, abbé), a French natural philosopher, eminent for his discoveries in crystallography, was the eldest son of a weaver in the town of St. Just, in the department of Oise, where he was born February 28th, 1743. He was brought up as a chorister in a church of the fauxbourg St. Antoine at Paris, and made considerable proficiency in music; but, being re-moved to the college of cardinal Lemoine, he contracted an acquaintance with the herbalist L'Hommond, and applied himself to the study of botany, and attended Daubenton's Lectures on mineralogy. The accidental fall of a specimen of calcareous spath, crystallised into prisms, led him to find in some of the fragments the form of the crystal rhomboides of the lceland spath; and from this circumstance the whole of his theory respecting crystals, the means of admeasuring them, &c., is said to have taken its origin. Admitted a member of the Academy of Sciences, in 1783, he continued his researches in mineralogy until the Revolution; when, refusing to take the oath to the new ecclesiastical authorities, he was displaced. But he soon after was made commissary of weights and measures, and succeeded Daubenton as lecturer on his favorite science of mineralogy. A favorite with Napoeon, he now became professor of mineralogy at the Museum of Natural History, and of the faculty of sciences, at the academy of Paris. He died June 3d, 1822. His chief works are Essai sur la Theorie et la Structure des Cristaux, 1784; Traité de Minéralogie, 1801, 4 vols. 8vo.; Traité élémentaire de Physique, 1803, 2 vols. 8vo.; Tableau comparatif des résultats de la Cristallographie, 1809; Traité des Carac-tères Physiques des Pierres Précieuses, 1817; Traité de Cristallographie, 1822, 2 vols. 8vo., with an atlas. He also published papers in the Journal des Mines, periodical works.

HAW, n.s. Sax. μ_{32} ; Goth. hag, haiga. The berry and seed of the hawthorn. An excrescence in the eye. Sax. μ_{323} ; Dan. haw, a garden. A small piece of ground adjoining to a house. In Scotland they call it haugh.

The seed of the bramble with kernel and haw.

Tusser. Store of haws and hips portend cold Winters. Bacon's Natural History.

Upon the haw at Plymouth is cut out in the ground the portraiture of two men, with clubs in their hands, whom they term Gog and Magog. Carew.

His quarrel to the hedge was, that his thorns and his brambles did not bring forth raisins, rather than haws and blackberries. L'Estrange.

HAW, v. n. Perhaps corrupted from hawk or

hack To speak slowly with frequent inter mission and hesitation.

'Tis a great way; but yet, after a little humming and hawing upon't, he agreed to undertake the job. L'Estrange.

HAWEIS (Thomas), an English Calvinistic divine, was born at Truro in Cornwall, in 1734. He was brought up an apothecary, but went to Christ Church College, Cambridge, and took the degree of B.A.: on taking orders he became assistant to Mr. Madan at the Lock Hospital, and obtained, on his recommendation, the living of Aldwinkle in Northamptonshire, on the condition that he should at a certain time resign it. This he however refused to perform, and much controversy ensued, until a compromise was effected by the interference of the countess of Huntingdon. Mr. Haweis was entrusted with the care of the chapels and seminary for students in divinity, founded by that lady; and late in life took the degree of M. D. He died in February 1820. His chief works are a volume of Sermons; A Commentary on the Bible, 2 vols. folio; History of the Church, 3 vols. 8vo.; Life of the Rev. William Romaine, 8vo.; State of Evangelical Religion throughout the World, 8vo.

HAWES (William), M.D., founder of the Royal Humane Society, was born at Islington, November 28th, 1736, and educated at St. Paul's school. Brought up to the profession of an apothecary, he practised in the Strand until 1780, when he took his diploma as a physician; and, in 1773, became popular by his exertions in the establishment of the Humane Society, to the benefit of which he dedicated the whole of his after life. In the first instance he paid the rewards for the recovery of drowning persons out of his own pocket; but was at length, by the assistance of Dr. Cogan, enabled to form the society. This benevolent physician died at Islington 5th of December, 1808. He wrote an Account of Dr. Goldsmith's last Illness (attributing his death to an improper administra tion of James's powders); An Address on Pre mature Death and Premature Interment; An Examination of the Rev: John Wesley's Primitive Physic; An Address to the Legislature on the importance of the Humane Society; An Address to the King and Parliament of Great Britain, with Observations on the general Bills of Mortality; and Transactions of the Royal Humane Society, from 1774 to 1784, dedicated by permission to the King.

HAW1CK, a town in a parish of the same name in Roxburghshire, erected into a burgh of barony at a very early period, though its most ancient charters are lost. Queen Mary renewed its privileges, by a charter dated 1545. It is governed by two bailies, fifteen merchants, and fourteen trades' councillors. Its chief manufactures are carpets, serges, table-covers, rugs, narrow cloths, tapes, twists, hose, &c., and winnowing machines. Hawick is seated at the conflux of the Tiviot and the Slitbridge; and lies fifteen miles south-west of Kelso.

HAWK, n. s. & v. n.	Sa
HAW'KED, adj.	habes
	cipite
	Thisy

Sax. paper; Welsh, habeg, hoch; Lat. accipiter; Germ. hock. This word has a variety of significations, as, a bird of prey, anciently used in sport to catch birds: to fly hawks; to fly at or attack on the wing. Hawked, formed like a hawk's bill. Hawk, as derived from hoch, is to force up phlegm from the throat with a noise, from hock: to sell by proclaiming in the streets; and a hawker is one thus employed. Hawkweed is a plant. Of the birds there are several kinds, as goshawk, sparrowhawk, &c.

Gret was the sorwe for that haukes harme, That Canace and all hire women made.

Chaucer. The Squieres Tale.

There was the tirant with his fethers don And grene, I mene the goshauke, that doth pine To birdes, for his outrayious ravine.

*; the hardie sperhauke, eke

Id. The Assemble of Foules. The quales foe. And in their tops the soring hauke did towre Sitting like king of fowles in maiesty and powre.

Spenser. Faerie Queene.

Come, sit, sit, and a song .- Shall we clap into't roundly, without hawking or spitting, or saying we are hoarse, which are the only prologues to a bad Shakspeare. voice ?

Ride unto St. Alban's,

Whereas the king and queen do mean to hawk. Id.

Do'st thou love hawking ? Thou hast hawks will soar

Above the morning lark.

A faulcon tow'ring in her pride of place,

Was by a mousing cwl hawked at and killed.

A long-winged hawk, when he is first whisteled off the fist, mounts aloft, and for his pleasure fetcheth many a circuit in the ayr, still soaring higher and higher, till he be come to his full pitch, and in the end, when the game is sprung, comes down amain, and stoops upon the sudden.

Burton's Anatomy of Melancholy.

Hawking comes near to hunting, the one in the ayre as the other on the earth, a sport as much affected as the other, by some preferred. Id.

It can be no more disgrace to a great lord to draw a fair picture, than to cut his hawk's meat.

Peacham.

Id.

Id.

Blood, cast out of the throat or windpipe, is spit out with a hawking or small cough ; that out of the gums is spit out without hawking, coughing, or vomiting. Harvey.

Flat noses seem comely unto the Moor, an aquiline or hawked one unto the Persian, a large and prominent nose unto the Roman. Browne.

Whether upward to the moon they go,

Or dream the Winter out in caves below,

Or hawk at flies clsewhere, concerns us not to know. Dryden.

One followed study and knowledge, and another hawking and hunting. Locke.

He that hawks at larks and sparrows has no less sport, though a much less considerable quarry, than he that flies at nobler game.

A falc'ner Henry is, when Emina hawks ;

With her of tarsels and of lures he talks. Prior.

She complained of a stinking tough phlegm which she hawked up in the mornings. Wiseman.

To grace this honoured day the queen proclaims, By herald hawkers high, heroick games :

She summons all her sons ; an endless band Pours forth, and leaves unpeopled half the land.

Pope.

I saw my labours, which had cost me so much thought, bawled about by common hawkers, which I

HAW once intended for the consideration of the greatest person. Swif:.

His works were hawked in every street; But seldom rose above a sheet. Id.

Whence borne on liquid wing

The sounding culver shoots ; or where the hawk, High in the beetling cliffs, his eyry builds.

Thomson.

HAWKE (Edward), lord Hawke, a brave British admiral, was the son of an eminent barrister, and entered into the navy at an early age. In 1734 he obtained the command of a man of war, and distinguished himself by his bravery in the famous engagement in 1744, wherein the British fleet was commanded by Matthews, Lestock, and Rowley. See ENGLAND. In 1747 he was made rear-admiral of the White, when he defeated a large French fleet, and captured five ships of the line; on which he was created a knight of the Bath. In 1759 he defeated admiral Conflans off Belleisle, and was rewarded with a pension of £2000 a-year. In 1765 he was appointed vice-admiral of Great Britain, and first lord of the admiralty. In 1776 he was created a British peer, and died in 1781.

HAWKERS were anciently persons who went from place to place buying and selling brass, pewter, and other merchandise, which ought to be uttered in open market. In this sense the word is mentioned, 25 Hen. VIII., cap. 6., and 33, cap. 4. The appellation seems to have arisen from their uncertain wandering, like those who, with hawks, seek their game where they can find it. The term is now used as synonymous with pedlar; a person who travels about the country selling wares. Every hawker must take out an annual license, for which he must pay £4; and if he travels with a horse, ass, or mule, for every one of them £8. If he travels without a license, or contrary to it, he forfeits for every offence, to the informer, and the poor of the parish where discovered, £10. The acts relating to hawkers do not extend to makers of goods or their agents; or to those who sell goods in fairs or markets; to the sellers of fish, fruit, or other victuals; nor to the venders of newspapers. But hawkers shall not, by virtue of such license, sell or offer to sale any tea or spirituous liquors, though with a permit, under the penalty of having the same seized, and imprisonment and prosecution of the offender.

HAWKESWORTH (John), LL.D. a celebrated English writer, born in 1715, and brought up to the profession of a watchmaker. He was a member of the Rev. Mr. Bradbury's church, from which he was expelled for irregularity. He afterwards devoted himself to literature, and became an author of considerable eminence. In the early part of his life his circumstances were rather confined. He resided some time at Bromley, in Kent, where his wife kept a boarding school. He afterwards became known to a lady who had great property and interest in the East India Company, and through her means was chosen a director of that body. His Adventurer is his principal work, and its merits procured him the degree of LL. D. through archbishop Herring. When the design of com piling a narrative of the discoveries in the South

G 2

Seas was on foot, he was recommended as a proper person to be employed on the occasion: but the performance did not answer the public expectation. Works of taste and elegance, where imagination and the passions were to be affected, were his province; not works of dry, cold, accurate narrative. However, he executed his task, and received for it the enormous sum of £6000. He died in 1773, some say of high living, others, of chagrin from the ill reception of his Narrative. On a handsome marble monument at Bromley, in Kent, is the following inscription, the latter part of which is taken from the last number of The Adventurer:—

> To the memory of JOHN HAWKESWORTH, LL.D. Who died the 16th of November MDCCLXXIII, aged 58 years. That he lived ornamental and useful To society, in an eminent degree, Was among the boasted felicities Of the present age;

That he labored for the benefit of society, Let his own pathetic admonitions Record and realise.

⁴ The hour is hasting, in which whatever praise or censure I have acquired will be remembered with equal indifference. Time, who is impatient to date my last paper, will shortly moulder the hand which is now writing it in the dust, and still the breast that now throbs at the reflection. But let not this be read as something that relates only to another; for a few years only can divide the eye that is now reading from the hand that has written.'

HAWKING. See FALCONRY.

HAWKINS (Sir John), a brave English admiral under queen Elizabeth, born in Devonshire. He was rear-admiral of the fleet which she sent against the Spanish Armada, and had a great share in that glorious victory. He was afterwards made treasurer of the navy. But his memory is disgraced by his having been the first European who carried off slaves from the coast of Africa, and introduced that inhuman traffic into the West Indies. Queen Elizabeth herself, while she honored his bravery by knighthood, threatened him with the divine vengeance for this practice. He died in the West Indies in 1595.

HAWKINS (Sir John), a celebrated author, and a lineal descendant of the admiral, was born in London, March 30th, 1719. He was the youngest son of Mr. Ilawkins, a house-carpenter and builder in London, and was bred to the law. Though deeply engaged in that study, in his younger years, and afterwards in the practice, he found leisure to exercise his genius by writing essays on various subjects, for the Gentleman's Magazine, Universal Spectator, and Westminster Journal; some of which attracted the attention of the public. He formed an early intimacy with Dr. Johnson, which continued through life. About 1741 he became a member of two Musical Societies, and in 1742 published six Cantatas, the poetry of five of which was written by himself, and the music composed by his friend Mr. Stanley These having succeeded beyond ex-

pectation, he published other six soon after, which proved the means of making his fortune, by introducing him to the acquaintance of Peter Storer, esq., of Highgate, whose youngest daughter Sidney he married in 1753, and with her received a handsome fortune, as well as a very large addition to it, on the death of her brother in 1759. Having early entertained a fondness for angling, he now gave up business, and purchased a house at Twickenham, on the Thames, where he could enjoy his favorite amusement. In 1760 he published a new edition of Walton's Complete Angler, in 8vo. with notes; to which he prefixed a Life of Walton. In 1761 he was appointed a justice of the peace for Middlesex. In 1763 he published in 8vo. Observations on the State of the Highways, and on the laws for amending and keeping them in repair : to which he subjoined the draught of a bill, which was afterwards passed into a law. In 1764 he distinguished himself by opposing an enormous claim of the city of London, which, in a bill presented to Parliament, had proposed to subject the county of Middlesex to two-thirds of the expense of rebuilding the jail of Newgate, estimated at £40,000. Mr. Hawkins drew a petition against the bill with such success, that it was withdrawn by the city members. In 1765 he was elected chairman of the quarter session. In 1768 and 1769, during the riots at Brentford and Moorfields, he acted with so much spirit, activity, and propriety, that, in 1772, his majesty conferred on him the honor of knighthood. In 1773, and 1778, he enriched Dr. Johnson's and Mr. Stevens's edition of Shakspeare with those notes which bear his name. In 1776 he published his General History of the Science and Practice of Music; in 5 vols. 4to., dedicated to the king, and which he presented to him personally, at Buckingham House. The collecting of the materials for this work had cost him sixteen years labor. In 1784 he met with one of the severest losses a literary man can sustain, by the destruction of his valuable library, containing many rare books, by fire. In 1787 he published the Life and Works of Dr. Johnson, in 11 vols. 8vo. dedicated to the king. He died at Westminster of an apoplexy, on the 21st of May 1789 : leaving the character of an active magistrate, an affectionate husband and parent, a firm friend, and a sincere Christian.

HAWKINS, a county of East Tennessee, United States. Rogersville is the chief town.

HAWKIN'S ISLAND, an island off the west coast of North America, in Prince William's Sound, about twenty miles long, and from one to four miles wide. Long. 214° 10' to 214° 38' E., lat. 60° 28' to 60° 40' N.

HAWKWEED. See CREPIS and HIERACIUM.

HAWKWOOD (Sir John), a famous English general, was the son of a tanner at Sible Heddingham in Essex, where he was born in the reign of Edward III. He was bound apprentice to a tailor in London; but, being pressed into the army, was sent abroad, where he signalised himself as a soldier in France and Italy, and particularly at Pisa and Florence. He commanded with great ability and success in the army of Galeacio duke of Milan; and was in such high esteem with Barnabas, his brother, that he gave him Domitia his natural daughter in marriage, with an ample fortune. He died at Florence, full of years and military fame, in 1394.

HAWLBOWLING, a small island in Cork harbour, Ireland, nearly opposite to the town of Cove, on which there is a small fort; and which, during the late war, was fixed upon as a naval depôt.

HAWSE, or HAUSE, implies the situation of the cables before the ship's stem, when she is moored with two anchors out from forward, viz. one on the starboard and the other on the larboard bow. Hence it is usual to say, she has a clear hawse, or a foul hawse. It also denotes any small distance a-head of a ship, or between her head and the anchor employed to ride her, as, He has anchored in our hawse, The brig fell athwart our hawse, &c. A ship is said to ride with a clear hawse when the cables are directed to their anchors, without lying athwart the stem; or crossing, or being twisted round each other by the ship's winding about, according to the change of the wind, tide, or current. A foul hawse, on the contrary, implies that the cables lie across the stem, or bear upon each other, so as to be rubbed and chafed by the motion of the vessel. The hawse accordingly is foul, by having either a cross, an elbow, or a round turn. If the larboard cable, lying across the stem, points out on the starboard side, while the starboard cable at the same time grows out on the larboard side, there is a cross on the hawse. If, after this, the ship, without returning to her former position, continues to wind about the same way, so as to perform an entire revolution, each of the cables will be twisted round the other, and then directed out from the opposite bow, forming what is called a round turn. An elbow is produced when the ship stops in the middle of that revolution, after having had a cross: or, in other words, if she rides with her head northward with a clear hawse, and afterwards turns quite round, so as to direct her head northward again, she will have an elbow.

HAWSE-PIECES, the foremost timbers of a ship, whose lower ends rest on the knuckle timber, or the foremost of the cant timbers. They are generally parallel to the stem, having their upper ends sometimes terminated by the lower part of the beak-head, and otherwise by the top of the bow, particularly in small ships and merchantmen.

HAWSER, n.s. a large rope which holds the middle degree between the cable and tow-line, in any ship whereto it belongs, being a size smaller than the former, and as much larger than the latter

HAW'THORN, n. s. Sax. pæg Sonn. A HAW'THORN-FLY, n. s. Species of medlar; the thorn that bears haws; the white-thorn. Hawthorn-fly, an insect.

Some in her hondes baren boughes shene. Some of laurer, and some of okes bene, Some of hawthorne, and some of wodebind, And many mo which I have not in mind.

Chaucer. The Floure and the Leafe.

There is a man haunts the forest, that abuses our young plants with carving Rosalind on their barks ; hangs odes upon hawthorns, and elegies upon bram-Shakspeare. As You Like It. bles.

The hawthorn-fly is all black and not big. Walton.

Some in their hands, beside the lance and shield, The boughs of weodbine or of hawthorn held.

Dryden.

Now hawthorns blossom, now the daisies spring. Pope.

The hawthorn whitens. Thomson. From the moist meadow to the withered hill. Led by the breeze the vivid verdure runs And swells and deepens; to the cherished eye The hawthorn whitens. Young's Night Thoughts.

The use to which it is applied in England is to make hedges : there are two or three varieties of it about London; but that sort which produces the , smallest leaves is preferable, because its branches always grow close together. Miller.

HAY, n. s. Sax, piez, piz; French, HAY-MAKER, n, s. haie, a hedge; Dutch, HAY-COCK, n. s. hey. Grass dried to fodder cattle in winter. Hay-maker, one employed in the process of making hay. Hay, as derived from haie, signifies a net which encloses the haunt of an animal. To dance the hay, is to dance in a ring, probably from dancing round a hay-cock.

This king of kinges was proud and elat ; He wend that God that sit in majestee

Ne might him nat bereve of his estat :

But sodenly he lost his dignitee,

And like a best him seemed for to be,

And ete hay as an oxe.

Chaucer. The Monkes Tale.

Make poor men's cattle break their necks; Set fire on barns and hay stacks in the night, And bid the owners quench them with their tears. Shakspeare.

I will play on the tabor to the worthies

And let them dance the hay. Id. Make hay while the sun shines.

Camden's Remains.

We have heats of dungs, and of hays and herbs laid up moist. Bacon.

This maids think on the hearth they see, When fires well nigh consumed be, There dancing hays by two and three, Just as your fancy casts them. Drayton.

The gum and glistening, -

Looks just as if that day

Snails there had crawled the hay. Suckling. One while a scorching indignation burnes

The flowers and blossomes of our hopes away ; Which into scarsitie our plentie turnes,

And changeth unmowne-grasse to parched hay. G. Withers.

Or if the earlier season lead

To the tanned hay-coch in the mead. Milton. By some hay-cock ; or some shady thorn,

He bids his beads both even song and morn. Dryden.

Coneys are destroyed by hays, curs, spaniels, or tumblers, bred up for that purpose. Mortimer.

The best manure for meadows is the bottom of hay mows and hay stacks. Id.

Some turners turn long and slender sprigs of ivory, as small as an lury stalk. Moxon.

As to the return of his health and vigour, were you here, you might enquire of his haymakers.

Pope to Swift.

Hay and oats, in the management of a groom will make ale. Swift.

HAY. The time of mowing grass for hay must be regulated according to its growth and ripeness; nothing being more prejudicial to the crop than mowing it too soon; because the sap is not then fully come out of the root, and, when made into hay, the grass shrinks away to nothing. It must not, however, he let stand too long till it have shed its seeds. When the tops of the grass look brown, and begin to bend down, and the red honey-suckle flowers begin to wither, it is ripe for mowing.

A HAY for taking rabbits, hares, &c., is made from fifteen to twenty fathoms in length, and in depth a fathom. As rabbits often straggle abroad about mid-day for fresh grass, when they are gone forth to any remote brakes or thickets, pitch two or three of these hays about their burrows, and lie close there; but, if there are not hays enough to enclose all their burrows, some may be stopped up with stones, &c. Then set out with the dog to hunt up and down at a good distance, and draw on by degrees to the man who lies close by the hay, who may take them as they bolt into it.

HAY (William), esq., an English writer, born at Glenburne, in Sussex, about 1700, and educated at Headley. In 1730 he published a poem, called Mount Caburn, dedicated to the duchess of Newcastle. In 1734, when lord Hardwicke was created a peer, he was chosen to succeed him as M. P. for Seaford, which he continued to represent during his life. He defended the measures of Sir Robert Walpole, and was supposed to be the author of a ministerial pamphlet, entitled A Letter to a freeholder on the late Reduction of the Land-tax to one Shilling in the Pound; printed in 1731. In 1735 he published Remarks on the Laws relative to the Poor, with Proposals for their better Relief and Employment; and brought in two bills for that purpose, but without effect. In May 1738 he was appointed a commissioner of the Victualling office. In 1753 appeared his Religio Philosophi; or the Principles of Morality and Christianity, illustrated from a View of the Universe, and of Man's Situation in it. This was followed, in 1754, by his Essay on Deformity; in which he rallies his own imperfections with much liveliness and good humor. 'Bodily deformity,' says he, ' is very rare. Among 558 gentlemen, in the house of commons, I am the only one that is so. Thanks to my worthy constituents, who never objected to my person, and I hope never to give them cause to object to my behaviour.' In 1754 he also translated Ilawkins Browne De Immortalitate Animi. In 1755 he translated and modernised some Epigrams of Martial. A little time before, he had been appointed keeper of the Records in the Tower; and it is said that his attention and assiduity during the few months he held that office were eminently serviceable to his successors. He died January 19th, 1755.

HAY, in geography, a town of South Wales, in Brecknockshire, seated near the confluence of the rivers Wye and Dulas. It was a town of note in the time of the Romans; being fortified with a castle and wall, which were ruined in the rebellion of Owen Glendower. It is at present a considerable town; and has a large market for corn and cattle.

HAY

HAYDN (Joseph), a celebrated musical composer, born in Lower Austria, in 1733. His father was a wheel-wright, and placed in such circumstances that he could neither give his son an education suited to a liberal profession, nor procure for him instruction in that art for which he manifested an early and an ardent predilection. He was accustomed to sing to his father's harp the simple tunes which, without any knowledge of music, his father played; and he acquired a little acquaintance with different instruments under the tuition of a schoolmaster, his relation. From this school he was taken to Vienna, to sing in the choir of the imperial chapel. Reuter, who was maestro de capello of the cathedral, was here sensible of his merits and foresaw his fame. At the age when his voice began to change, Haydn was dismissed from the choir ; after which, during a long course of years, he endured all the rigor of adverse fortune, finding it very difficult to earn even a bare subsistence. He lodged in the sixth story; his garret had neither door nor casement; his breath congealed on his bed-clothes; and the water which he fetched from the fountain for his toilette in the morning, was frequently changed into ice before he could re-ascend to the exalted regions of his abode. Haydn gave lessons, and performed at orchestras and musical parties; but his indigence kept him secluded from society: an old wormeaten harpsichord was his sole source of happiness. Consoling himself with this companion of his misfortunes, he courageously continued to compose; and his ardent genius prevented him from sinking into a state of torpid despair. At last he had the good fortune to have as his pupil a Miss Mortini, a relation of Metastasio ; and at her house he obtained his board gratis during three years. Afterwards he removed to one of the suburbs. About that time he engaged himself as director of the choir of the Charitable Brothers, in the Leopoldstadt, at a salary of sixty florins per annum. He was obliged, on Sundays and holidays, to be at their church by eight o'clock in the morning; at ten he played the organ in the chapel of count Haugwitz, and at eleven he sung in the choir of the cathedral of St. Stephen. Thousands would have sunk under such hardships. He came to England in 1791, and returned to Germany in 1796. During his stay he composed many pieces, and met with those rewards and that admiration which he so highly merited .- Haydn never was in Italy. If he had enjoyed that advantage, there can be no doubt that, with his excellent ideas of singing and harmony, he would have acquired great reputation as a composer of operas. IIe, however, spoke Italian with considerable facility, and acknowledged that he owed much to an Italian musician of the name of Porpora, with whom he became acquainted at the house of a lady in Meinersdorf. Haydn served about three months in the capacity of a valet, solely for the purpose of improving himself by his instructions. Porpora was teach-ing the lady to sing, and Haydn accompanied her on the harpsichord; during the intervals

between the lessons, he submitted his compositions to the correction of his master. Thus was formed the composer, whose sublime notes resound in all the orchestras of Europe; and who continued his labors with increasing applause and glory during half a century, to the time of his death in 1809. His principal works, besides innumerable symphonies, are, The Creation and the Seasons.

southern point of Hudson's Bay, formed by the rivers Nelson and Hayes, which, after running togther for some time, separate into two arms. Near the entrance of them into the sea stands York Fort, called by the French De Bourbon.

HAYLEY (William), a poet and biographical writer, was born November 9, 1745, at Chichester, of which cathedral his grandfather had been dean. He received his education at the school of Kingston-upon-Thames, and at Eton, whence he removed to Trinity College, Cambridge. On leaving the University he retired to his paternal estate of Eartham, in Sussex, where he resided till the loss of a natural son, about 1800, so afflicted him that he removed to Felpham in that county, where he died November 12, 1820. His principal publications are, 1. An Essay on 2. An Essay on History. 3. An Painting. Essay on Epic Poetry. 4. The Triumphs of Temper. An edition of these, with other pieces His and plays, was printed in 6 vols. 8vo. prose works are, An Essay on Old Maids, 3 vols., and the Lives of Milton, Cowper, and Romney the Painter. He was the author of various elegant quartos, and quartos have been devoted to his personal history: but he will be chiefly known to posterity as the biographer of Cowper; whose character, after all, he but very imperfectly understood.

HAYNES (Hopton), a learned unitarian, born in 1672. In 1696 he was employed in the mint, in which he rose to the office of king's assaymaster. In the year 1748, becoming infirm, he was allowed to retire. He was also principal talley-writer at the exchequer for forty years; and died in 1749, at the age of seventy-seven. He wrote The Scripture Account of the Attributes and Worship of God, and of the Character and Offices of Jesus Christ, of which a second edition was printed by the Rev. Theophilus Lindsay in 1790.

HAYNES (Samuel), son of the above, was educated at King's College, Cambridge, where he took his degree of D. D. 1748. He was tutor to the earl of Salisbury, by whom he was presented to the livings of Hatfield and Clothel; he was also a canon of Windsor, and published a collection of state papers, relating to affairs in the reigns of Henry VIII., Edward VI., Mary, and Elizabeth, from 1542 to 1570, transcribed from the Cecil MSS. Dr. Haynes died in 1752.

HAYTER (John), M. A., was educated at Eton and King's College, Cambridge, where he obtained the degree of B.A. in 1778, and that of M.A. in 1788, between which dates he was presented to the living of Hepworth in Suffolk. His present majesty, then prince of Wales, offering to be at the expense of unrolling and decyphering the Greek MSS. in the ruins of Herculaneum, Mr.

Hayter was appointed to superintend the experiment, and in consequence took up his abode at Palermo. He returned in 1810, and the MSS. were presented to the University of Oxford ; but the result disappointed the public. He soon after died of an apoplectic shock in France. He published Observations on the Herculanensia, 4to.

HAYWARD, one who keeps the common HAYE'S ISLAND, a small island near the herd or cattle of a town. He is appointed by the lord's court; his office is to see that the cattle neither break nor crop the hedges of enclosed grounds.

HAYWARD (Sir John), an eminent English historian and biographer of the seventeenth century, educated in the University of Cambridge. where he took the degree of LL.D. In 1610 he was appointed historiographer of a college then at Chelsea; and, in 1619, was knighted. He wrote, 1. The lives of the three Norman kings of England, William I. and II., and Henry I. 2. The first part of the life and reign of king Henry IV. 3. The life and reign of king Edward VI.; and several theological works. He died in 1627.

HAZAEL, Heb. חואל i. e. seeing God., an officer belonging to Benhadad, king of Syria, who, as is generally supposed from the common rendering of 2 Kings viii. 15, caused that prince to be put to death, and reigned in his stead. Some, however, have thought that the thick cloth was spread over the face of Benhadad by himself or by his order to allay the violence of the fever. Hazael defeated Joram, Jehu, and Jehoahaz, kings of Israel; and, after his death, was succeed ed by Benhadad his son, A. A. C. 889.

HAZ'ARD, n. s, v.a. &	French, hazard,
HAZ'ARDABLE, adj. [v n.	hazarder, hazar-
HAZ'ARDER, n. s.	deux; Ital. and
	Sp. azar ; Runic,
	haski. 'Hazard,'
HAZ'ARDOUSLY, adv.	' says Crabb,

' comes from the oriental zar and tzar, signifying any thing bearing an impression, particularly the die used in chance games, which is called by the Italians *zara*, and by the Spaniards *azar*. Hazard is when, in contingent events, the inclination is to the unfavorable side, and thus it is opposed to chance. The figurative meanings are, accident; danger; risk; to try your chance; to venture. Hazardry is temerity; precipita-tion; rash adventure; all derived from, and founded on, the literal meaning applied to dice

Hasa	rd is vera	you defend ay moder of , and curs	of lesing	es,

For to And	o ben hol ever the nore he i	nd contrar d a comm higher he s holden d <i>Chaucer</i> . <i>T</i>	on <i>hasar</i> is of est lesolat.	dour,

-Live, and allegiance owe To him that gives thee life and liberty, And henceforth by this daies ensample trow, That hasty wroth and heedlesse hazardry, Doe breed repentance late and lasting infamy. Spenser's Fucrie Queene. HAZ

We are bound to yield unto our Creator, the Father of all mercy, eternal thanks, for that he hath delivered his law unto the world ; a law wherein so many things are laid open, as a light which otherwise would have been buried in darkness, not without the hazard, or rather not with the hazard, but with the certain loss of thousands of souls, most undoubtedly now saved. Hooker.

They might, by persisting in the extremity of that opinion, huzard greatly their own estates, and so weaken that part which their places now give. Id.

I have set my life upon a cast,

And I will stand the hazard of the die. Shakspeare.

I will upon all hazards well believe

Thou art my friend, that knowest my tongue so well. Id.

> I pray you tarry; pause a day or two Before you hazard; for, in chusing wrong,

Id. I lose your company.

It was not in his power to adventure upon his own fortune, or hearing a public charge to hazard himself against a man of private condition. Hayward,

An hazardable determination it is, unto fluctuating and indifferent effects, to affix a positive type or period. Browne.

She from her fellow-provinces would go, Rather than huzard to have you her foe.

Waller.

Grant that our hazardous attempt prove vain, We feel the worst, secured from greater pain. Dryden.

The hazard I have run to see you here, should inform you that I love not at a common rate. Id.

Where the mind does not perceive connection, there men's opinions are not the product of judgment, but the effects of chance and hazard, of a mind floating at all adventures, without choice and without direction. Locke.

The wise and active conquer difficulties

By daring to attempt them : sloth and folly

Shiver and shrink at sight of toil and hazard,

And make the impossibility they fear. Rowe.

Men are led on from one stage of life to another in a condition of the utmost hazard, and yet without the least apprehension of their danger. Rogers.

By dealing indifferently mercies to all, you may Sherlock. hazard your own share.

The duke, playing at hazard, held in a great many hands together, and drew a huge heap of gold.

Swift.

Reason! the hoary dotard's dull directress, That loses all because she hazards nothing. Dr. Johnson's Irene.

HAZARD, in gaming. See GAMING.

HAZARD, is properly so called, as it speedily enriches a man or ruins him. It is played only with two dice without tables; and as many may play as can stand round the largest round table. Two things are chiefly to be observed, viz. main and chance; the latter belonging to the caster, and the former, or main, to the other gamesters. There can be no main thrown above 9, or under 5; so that 5, 6, 7, 8, and 9, are the only mains. Chances and nicks are from 4, to 10; thus 4 is a chance to 9, 5 to 8, 6 to 7, 7 to 6, 8 to 5; and 9 and 10 a chance to 5, 6, 7, and 8: in short, 4, 5, 6, 7, 8, 9, and 10, are chances to any main, if any of these nick it not. Now nicks are either when the chance is the same with the main, as 5 and 5; or the like; or 6 and 12, 7 and 12, 8 and 12.

Here observe that 12 is out to 9, 7, and 5; 11 is out to 9, 8, 6, and 5; and ames-ace and deuce ace, are out to all mains whatever.

HAZE, n. s., v.n. & v. a. Sax. parpe; Goth. Ha'zy, adj. hasa, hoar-frost. Fog or mist; dark; dull: to haze is to confuse; hence to frighten or alarm.

Our clearest day here is misty and hazy; we see not far, and what we do see is in a bad light.

Burnet's Theory.

Oft engendered by the hazy North,

Myriads on myriads, insect armies waft. Thomson.

HAZEBROUK, a large town of French Flanders, twenty-seven miles west by north of Lille. Its streets are straight, and its houses in general well built : its population about 6600. It is the capital of an arrondissement; and has a brisk trade in thread, linen, and fruits the produce of the surrounding country.

HA'ZEL, adj. Sax. pærel; Lat. corylus. HA'ZELLY, adj. Nut tree. Light brown, of the color of hazel; hence used figuratively to describe color.

Kate, like the hazel twig, Is straight and slender; and as brown in hue As hazel nuts, and swecter than the kernels.

Shakspeare.

Id. Her chariot is an empty hazel nut. Why sit we not beneath the grateful shade,

Which hazels, intermixed with elms, have made? Dryden.

Uplands consist either of sand, gravel, chalk, rock, or stone, hazelly loam, clay, or black mould.

Mortimer.

Chuse a warm dry soil, that has a good depth of light hazel mould. Id.

There are some from the size of a hazel nut to that of a man's fist. Woodward.

Where flows the murmuring brook, inviting dreams; Where bordering hazel overhangs the streams,

Whose rolling current winding round and round, With frequent falls makes all the woods resound.

Gay.

The nuts grow in clusters, and are closely joined together at the bottom, each being covered with an outward husk or cup, which opens at the top, and when the fruit is ripe it falls out. The species are hazel-nut, cobnut, and filbert. The red and white filberts are mostly esteemed for their fruit. Miller.

The flowering thorn, self-taught to wind The hazel's stubborn stem entwined, And bramble twigs were wreathed around,

And rough furze crept along the ground.

Beattie.

HAZEL, or HAZLE, in botany. See CORYLUS. The kernels of the fruit have a mild, farinaceous, oily taste, agreeable to most palates. Squirrels and mice are fond of them, as well as some birds. A kind of chocolate has been prepared from them; and there are instances of their having been formed into bread. The oil expressed from them is little inferior to the oil of almonds; and is used by painters and by chemists for receiving and retaining odors. The charcoal made of the wood is used by painters in drawing. Evelyn tells us that no plant is more proper for thickening of copses than the hazel, for which he directs the following expeditious method. Take a pole of hazel twenty or thirty feet in length, the head a little lopped into the ground, giving it a chop near the ground to make it succumb; this

89

fastened to the earth with a hook or two, and covered with some fresh mould at a competent depth, will produce a great number of suckers, The and thicken and furnish a copse speedily. fruit, leaves, and catkins of this tree are very commonly found in peat mosses, and in the alluvial accumulations in the bottoms of valleys, having but little fall, and on the flat shores of lakes. In the alluvial flats in the valleys of Derbyshire, &c., hazel-nuts, &c., are very common in layers, between the silt and gravel. Woodward, in his Catalogue of Fossils, mentions nuts being found in Milnclose mine, which doubtless fell or were washed into opens from the surface; and on the whole it seems clear, that all these belong to the class of peat fossils, and are preserved in the most modern of the earthy deposits or accumulations.

HAZEL EARTH, OF HAZLEY EARTH, a kind of red loam, which is said to be an excellent mixture with other sorts of earth; uniting what is too loose, cooling what is too hot, and gently retaining the moisture.

HAZEL, WITCH. See HAMAMELIS, and UL-MUS.

HAZEL DIVINING RODS. We have glanced at this subject more than once. See BAGVETTE DIVINATOIRE, and DIVINING RODS. The fact is, that, in compiling both the foregoing articles, we obscurely recollected having seen a narrative on the subject, which we are at last able to present to our readers. It is from a note in the Quarterly Review. 'The narrative has been lately communicated to us,' says the writer, ' by a friend residing in Norfolk, and puts the subject in the clearest point of view. We shall simply state that the parties, whose names are well known to many of our readers, are utterly inca-pable either of deceiving others, or of being deceived themselves.

'January 21st, 1818 .- It is just fifty years since lady N's attention was first called to this subject; she was then sixteen years old, and was on a visit with her family at a château in Provence, the owner of which wanted to find a spring to supply his house, and for that purpose had sent for a peasant, who could do so with a twig. The English party ridiculed the idea, but still agreed to accompany the man, who, after walking some way, pronounced that he had arrived at the object of his search, and they accordingly dug and found him correct. -He was quite an uneducated man, and could give no account of the faculty in him, or of the means which he employed, but many others, he said, could do the same.

' The English party now tried for themselves, but all in vain, till it came to the turn of lady N., when, to her amazement and alarm, she found that the same faculty was in her as in the peasant, and, on her return to England, she often exerted it, though in studious concealment. She was afraid lest she should be ridiculed, or should, perhaps, get the name of a witch, and in either case she thought that she should certainly never get a husband !

'Of late years her scruples began to wear away; and when Dr. Hutton published Ozanam's Researches, in 1803, where the effect of the 'without reference to any foregoing word.

divining rod is treated as absurd (vol. iv. p. 260-7), she wrote a long letter to him, signed X.Y.Z., stating the facts which she knew. The P answered it, begging further information; lady N. wrote again, and he, in his second letter, re-quested the name of his correspondent: that lady N. also gave.

'A few years afterwards she went, at Dr. Hutton's particular request, to see him at Woolwich, and she then showed him the experiment, and discovered a spring in a field which he had lately bought near the New College, then building. This same field he has since sold to the college, and for a larger price in consequence of the spring.

'Lady N. this morning shewed the experiment to lord G., Mr. S., and me, in the park at W. She took a thin forked hazel twig, about sixteen inches long, and held it by the end, the joint pointing downwards. When she came to a place where water was under the ground, the twig immediately bent, and the motion was more or less rapid as she approached or withdrew from the spring. When just over it, the twig turned so quick as to snap, breaking near her fingers, which by pressing it were indented, and heated, and almost blistered; a degree of agitation was also visible in her face. When she first made the experiment, she says, this agitation was great : and to this hour she cannot wholly divest herself of it, though it gradually decreases. She repeated the trial several times in different parts of the park, and her statements were always accurate. Among those persons in England who have the same faculty, she says, she never knew it so strong in any as in Sir C. H. and Miss F. It is extraordinary that no effect is produced at a well or ditch, or where earth does not interpose between the twig and the water. The exercise of the faculty is independent of any volition.

'So far our narrator, in whom, we repeat, the most implicit confidence may be placed. The faculty so inherent in certain persons is evidently the same with that of the Spanish Zahories, though the latter do not employ the hazel twig."

HE. Pronoun. Gen. him; plur. they; gen. them. Dut. hy; Sax. be. It seems to have borrowed the plural from dir, plural dar, dative The man that was named before. birum.

All the conspirators, save only he, Did that they did in envy of great Cæsar.

Shakspeare.

If much you note him,

You shall offend him, and increase his passion; Feed and regard him not. Id. I am weary of this moon ; would he would change.

Id.

Adam spoke ;

So cheered he his fair spouse, and she was cheered. Milton.

When Adam waked, he on his side Id.

Leaning half raised hung over her.

Thus talking, hand in hand, along they passed Id. On to their blissful bowers.

Extol

Id. Him first, him last, him midst.

The man; the person. It sometimes stands

He is never poor

That little hath, but he that much desires. Daniel.

Man or male being.

Such mortal drugs I have ; but Mantua's law

Is death to any he that utters them. Shakspeare. I stand to answer thee, or any he the proudest of Id.

thy sort. Tros and his race the sculptor shall employ.

And he the god who built the walls of Troy

Ďryden.

Male : as, a he-bear, a he-goat. It is used where the male and female have not different denominations.

The he's in birds have the fairest feathers.

Bacon.

90

In the two last senses he is rather a noun than pronoun.

HEAD, n. s. Sax. bearoo, bearo; Belgic houed; old English heved, whence, by contraction, head. The part of the animal that contains the brain, or the organ of sensation and seat of thought.

But now a litel while I wol bewaile,

This Pompeius, this noble governour

Of Rome, which that fled at this bataille. I say on of his men, a false traitour,

His hed of smote, to winnen him favour Of Julius, and him the hed be brought :

Alas Pompeie! of the orient conquerour, That Fortune unto swiche a fin thee brought.

Chaucer. The Monkes Tale. Vein-healing verven, and head-purging dill.

Spenser.

Over head up-grew

Insuperable height of loftiest shade. Milton The dewy paths of meadows we will tread,

For crowns and chaplets to adorn thy head.

Dryden.

I could still have offers, that some, who held their heads higher, would be glad to accept. Swift.

And far beneath the earth and ocean spread Round him are icy rocks, and loudly blow

Contending tempests on his naked head, And thus reward the toils which to those summits led. Buron.

Person as exposed to any danger or penalty. What he gets more of her than sharp words, let it Shakspeare. lie on my head.

Who of all ages to succeed, but feeling

The evil on him brought by me, will curse

My head? ill fare our ancestor impure. Milton. O breast of pity void ! t' oppress the weak, To point your vengcance at the friendless head. And with one mutual cry insult the fallen !

Emblem too just of man's degenerate race.

Somerville's Chase,

Granville.

head.

Head and ears. The whole person. In gingling rhimes well fortified and strong, He fights intrenched o'er head and ears in song.

Denomination of any animals.

When Innocent desired the marquis of Carpio to furnish thirty thousand head of swine, he could not spare them; but thirty thousand lawyers he had at Addison. his service.

The tax upon pasturage was raised according to a Arbuthnot. certain rate per head upon cattle.

Chief; principal person; one to whom the rest are subordinate ; leader ; commander.

For their commons there is little danger from them, except it be where they have great and potent heads. Bacon.

Your head I him appoint ;

And by myself have sworn, to him shall bow All knees in heaven, and shall confess him lord.

Milton.

The heads of the chief sects of philosophy, as Thales, Anaxagoras, and Pythagoras, did consent to this tradition. Tillotson.

Place of honor; the first place.

Notwithstanding all the justices had taken their places upon the bench, they made room for the old knight at the head of them. Addison.

Place of command.

An army of fourscore thousand troops, with the duke of Marlborough at the head of them, could do Addison on the War. nothing.

Countenance; presence. Richard not far from hence hath hid his heud.

Shakspeare. Richard II. With Cain go wander through the shades of night,

And never shew thy head by day or light.

Shakspeare.

Ere to-morrow's sun shall shew his head. Dryden. Understanding; faculties of the mind: commonly in a ludicrons sense.

The wenches laid their heads together

L'Estrange.

Oh, says Reynard, never trouble your head, but leave that to me. Id.

Work with all the ease and speed you can, without breaking your head, and being so very industrious in starting scruples. Drydcn.

The lazy and inconsiderate took up their notions by chance, without much beating their heads about them. Locke.

If a man shews that he has no religion, why should we think that he beats his head, and troubles himself to examine the grounds of this or that doctrine ? Id.

When in ordinary discourse we say a man has a fine head, we express ourselves metaphorically, and speak in relation to his understanding; and when we say of a woman she has a fine head, we speak only in relation to her commode. Addison.

We laid our heads together to consider what grievances the nation had suffered under king George. Id.

Face; front; fore part.

The gathering crowd pursues ; The ravishers turn head, the fight renews. Dryden.

Resistance ; hostile opposition.

Then made he head against his enemies,

And Hymner slew. Faerie Queene. Sometimes hath Henry Bolingbroke made head

against my power. Shakspeare. Two valiant gentlemen making head against them,

seconded by half a dozen more, made forty run away. Ralcigh.

Sin having depraved his judgment, and got possession of his will, there is no other principle left him naturally, by which he can make head against it. South.

Spontaneous resolution.

The bordering wars in this kingdom were made altogether by voluntaries, upon their own head, without any pay or commission from the state. Davies,

State of a deer's horns, by which his age 15 known.

It was a buck of the first head. Shakspeare.

The buck is called the fifth year a buck of the first Id.

Individual. It is used in numbers or computation.

If there be six millions of people, then there are about four acres for every head. Graunt.

The top of any thing bigger than the rest. His spear's head weighed six hundred shekels of iron. 1 Samuel.

As high

As his proud head is raised towards the sky, So low towards hell his roots descend.

Denham. Trees which have large and spreading heads, would lie with their branches up in the water. Woodward.

If the buds are made our food, they are called heads or tops; so heads of asparagus or artichokes. Watts.

Head is an equivocal term ; for it signifies the head of a nail, or of a pin, as well as of an animal. Id.

When by the winds of autumn driven

The scattered clouds fly cross the heaven,

Oft have we from some mountain's head,

Beheld the alternate light and shade

Sweep along the vale.

The fore part of any thing, as of a ship. By gallies with brazen heads, she might transport over Indus at once three hundred thousand soldiers.

Raleigh.

His gallies moor ; Their heads are turned to sea, their sterns to shore.

Dryden.

That which rises on the top.

Let it stand in a tub four or five days before it be put into the cask, stirring it twice a-day, and beating down the head or yeast into it. Mortimer.

The blade of an axe.

A man fetcheth a stroke with the axe to cut down the tree, and the head slippeth from the helve.

Deut. xix. 5.

Beattie.

Upper part of a bed. Israel bowed upon the bed's head. Gen. xlvii, 31. The brain.

As eastern priests in giddy circles run,

And turn their heads to imitate the sun. Popc. Dress of the head.

Ladies think they gain a point when they have teazed their husbands to huy them a laced head or a fine petticoat. Swift.

Principal topic of discourse.

These heads are of a mixed order, and we propose only such as belong to the natural world.

Burnet's Theory.

'Tis our great interest and duty, to satisfy ourselves on this head, upon which our whole conduct depends. Atterbury.

Source of a stream.

It is the glory of God to give; his very nature delighteth in it : his mercies in the current, through which they would pass, may be dried up, but at the head they never fail. Hooker.

The current by Gaza is but a small stream, rising between it and the Red Sea, whose head from Gaza is little more than twenty English miles.

Raleigh's History.

Some did the song, and some the choir maintain, Beneath a laurel shade, where mighty Po

Mounts up to woods above, and hides his head below. Dryden.

Crisis; pitch.

The indisposition which has long hung upon me, is at last grown to such a head, that it must quickly make an end of me, or of itself. Addison.

Power; influence; force; strength; dominion.

Within her breast though calm, her breast though pure,

Motherly cares and fears got head, and raised Some troubled thoughts. Milton. Body; conflux.

91

People under command chuse to consult, and after to march in order ; and rebels contrariwise, run upon an head together in confusion. Bacon.

A mighty and a fearful head they are,

As ever offered foul play in a state. Shakspeare. Far in the marches here we heard you were,

Making another head to fight again. Id. Let all this wicked crew gather

Their forces to one head. Ben Jonson. Power; armed force.

My lord, my lord, the French have gathered head. Shakspeare.

At sixteen years,

When Tarquin made a head for Rome, he sought Beyond the mark of others. Id.

Liberty in running a horse.

He gave his able horse the head,

And bounding forward struck his agile heels

Against the panting sides of his poor jade

Up to the rowel head. Shakspeare.

License; freedom from restraint; a metaphor from horsemanship.

God will not admit of the passionate man's apelogy, that he has so long given his unruly passions their head, that he cannot now govern or controul them. South.

It is very improperly applied to roots.

How turnips hide their swelling heads below, And how the closing coleworts upwards grow.

Gay.

Head and shoulders. By force; violently. People that hit upon a thought that tickles them,

will be still bringing it in by head and shoulders, over and over, in several companies. L'Estrange.

They bring in every figure of speech, head and shoulders by main force, in spite of nature and their subject. Felton.

HEAD, adj. & v.a. HEAD'ER, n.s. HEAD'INESS, n. s. HEAD'LESS, adj. HEAD'LONG, adj. HEAD'Y, adj.

Chief, principal, whether applied to persons or things; to lead, influence, or direct; to behead; to fit any thing with a head; to lop the branches of trees.

HEAD'STRONG, adj. Header, one whose office it is to head pins or nails, &c.; the first brick of the angle. Headiness, haste; rashness; stubborness. Headless, without a head; without a chief; ignorant; obstinate; careless; inconsiderate. Headlong, precipitate; steep; rash. Headstrong, violent; ungovernable; resolute; one that will not be restrained. Heady, apt to affect the head; vertiginous; violent; impetuous.

If any rashly blame such his choice of old and unwonted words, him may I more justly blame and condemn, either of witless headiness in judging, or of headless hardiness in condemning. Spenser.

His shining helmet he 'gan soon unlace, And left his headless body bleeding at the place. Id.

Headed with flints and feathers bloody dyed, Arrows the Indians in their quivers hide.

Id. Faerie Queene.

If you head and hang all that offend that way but for ten years together, you'll be glad to give out a Shakspeare. commission for more heads.

Take pity of your town and of your people, While yet the cool and temperate wind of graco O'erblows the filthy and contagicus clouds Id. Of heady murther, spoil, and villany.

I am advised what I say : Neither disturbed with the effect of wine, Nor, heady rash, provoked with raging ire ; Albeit my wrongs might make one wiser mad. Id. I'll forbear, And am fallen out with my more heady will. To take the indisposed and sickly fit Id. For the sound man. I'll look no more, Lest my brain turn, and the deficient sight Id. Topple down headlong.

Never can reformation in a flood With such a heady current scowering faults; Nor ever hydra-headed wilfulness Id. So soon did lose his seat.

Were I man, a duke, and next of blood, I would remove these tedious stumbling-blocks, And smooth my way upon their headless necks. Id.

They rested not until they had made the empire stand headless about seventeen years. Raleigh.

Wives, the readiest helps

To betray heady husbands, rob the easy.

Ben Jonson.

On the cold earth lies the unregarded king, A headless carcase, and a nameless thing. Denham.

He liked the advice, and then soon it essayed, And presents crowd headlong to give good example,

So the bribes overlaid her that Rome once betrayed, The tribes ne'er contributed so to the temple.

Marvell.

The senate, which should headstrong princes stay, Let loose the reins and gave the realm away ; With lavish hands they constant tributes give, And annual stipends for their guilt receive. Id.

It suddenly fell from an excess of favour, which many examples having taught them, never stopt his race, 'till it came to a headlong overthrow. Sidney.

If the header of one side of the wall is toothed as much as the stretcher on the outside, it would be a stronger toothing, and the joints of the headers of one side would be in the middle of the headers of the course they lie upon of the other side. Moxon.

I was entertained with a sort of wine which was very heady, but otherwise seemed to be sack. Boyle.

Those only are regarded who are true to their party; and all the talent required is to be hot, to be heady, to be violent on one side or the other.

Temple.

Abas, who seemed our friend, is either fled, Or, what we fear, our enemies does head.

Dryden.

Some ask for envy'd power, which publick hate Pursues, and hurries headlong to their fate, Id. Down go the titles.

Of cornel-wood a spear upright,

Headed with piercing steel, and polished bright. Id.

Prickly stubs, instead of trees, are found; Headless the most, and hideous to behold. Id.

Since hearty beef and mutton will not do, Here's julep-dance, ptisan of song and show : Give you strong sense, the liquor is too heady ; You're come to farce, that's ass's milk, already. Id.

You must disbranen them, leaving only the summit entire : it may be necessary to head them too.

Mortimer. Nor is what has been said of princes less true of all other governours, from him that heads an army to him that is master of a family, or of one single ser-South. vant.

92

HEA

To give Ahab such warning as might infallibly have prevented his destruction, was esteemed by him evil; and to push him on headlong into it, because he was fond of it, was accounted good. Id.

If in good days, like these, the headstrong herd

Grow madly wanton and repine, it is

Because the reins of power are held too slack

And reverend authority of late

Has worn a face of mercy more than justice.

Rowe's Jane Shore. Men, naturally warm and heady, are transported with the greatest flush of good-nature. Addison.

This lord had headed his appointed bands. In firm allegiance to his king's commands.

Prior.

So when dread Jove the son of Phoebus hurled, Scared with dark thunder, to the nether world, The headstrong coursers tore the silver reins,

And the sun's beamy ruin gilds the plains. Gau Flow, Welsted ! flow, like thine inspirer beer; Gay. Heady, not strong; and foaming, though not full. Pope.

Headlong from thence the glowing fury springs, Id. And o'er the Theban palace spreads her wings.

And Haidee met the morning face to face ; Her own was freshest, though a feverish flush

Had dyed it with the headlong blood whose race From heart to cheek is curbed into a blush.

Byron. Don Juan.

HEAD OF A SHIP, an ornamental figure erected on the continuation of a ship's stem, as being expressive of her name, and emblematical of war, navigation, commerce, &c. Head is also used in a more enlarged sense, to signify the whole front or forepart of a ship, including the bows on each side; the head therefore opens the column of water through which the ship passes when advancing. Hence we say, head-sails, head-sea, head-way, &c. See NAVIGATION, and SHIP-BUILDING.

HE'ADACH, n. s. Head and ach. Pain in the head.

From the cruel headach,

Riches do not preserve. Sidney. Nothing more exposes to headachs, colds, catarrhs, and coughs, than keeping the head warm. Locke.

In the headach he orders the opening of the vein of the forehead. Arbuthnot.

At some dear idle time,

Nor plagued with headachs, or the want of rhyme. Pope.

HEAD'BAND, n. s. A fillet for the head; a topknot; the band at each end of a book.

The Lord will take away the bonnets, and the headbands. Isaiah.

HEAD'BOROUGH, n.s. Head and borough. A constable; a subordinate constable.

Here lies John Dod. ---

Father or mother, sister or brother, he never knew none :

A headborough and a constable, a man of fame,

The first of his house, and last of his name. Camden.

This none are able to break thorough,

Until they're freed by head of borough.

Hudibras.

The covering for a HEAD'DRESS, n. s. woman's head: any thing prominent on the head; resembling a head-dress.

Among birds the males very soon appear in a most beautiful headdress, whether it be a crest, a comb, a

tuft of feathers, or a natural little plume, erected like a kind of plunacle on the very top of the head.

Addison.

There is not so variable a thing in nature as a lady's *headdress*: I have known it rise and fall. *Id*.

If ere with airy horns I planted heads, Or discomposed the *headdress* of a prude.

Pope.

93

The HEAD DRESS, amongst the ancient Jewish, Grecian, and Roman ladies, as among ourselves, was various, according to the times, and the fluctuations of fashion. It principally consisted of their hair differently dressed. It was usually divided before, with a bodkin, into two equal parts; sometimes it was covered with a net, or put into a kind of purse, or tied behind in the form of a knot, or bound back and plaited with ribands. It was washed with great care; essence and perfumes were applied to it, and gold dust sometimes made use of as powder. Pearls and jewels made a part of their ornaments; and pendants were worn in the ears. To cover the defect of hair, perukes were made use of by the gentlemen at Rome. Otho had a covering of false hair.

HEAD'GARGLE, n. s. Head and gargle. A disease in cattle.

For the headgargle give powder of fenugreck. Mortimer.

HEAD'LAND, n. s. A promontory; a cape; ground under the hedges.

Now down with the grass upon *headlands* about, That groweth in shadow so rank and so stout.

Tusser.

An heroick play ought to be an imitation of an heroick poem, and consequently love and valour ought to he the subject of it : both these Sir William Davenant began to shadow; but it was so as discoverers draw their maps with *headlands* and promontories.

Dryden.

HEADLEY (Henry), B. A., an ingenious young poet, born at Norwich in 1765, and educated under Dr. Parr. He studied at Trinity College, Oxford, where he took his degree. He published a volume of poems; several pieces in the Olla Podrida; and a curious work entitled Select Beauties of Ancient English Poetry, with remarks; in 2 vols. 8vo. He died at Norwich in 1788, aged twenty-three.

HEAD-MOULD-SHOT, in medicine, is a disease wherein the sutures are so closely locked together, as to compress the internal parts, the meninges, or even the brain. It is supposed to admit of no cure from medicine, unless room could be given by manual operation or a divulsion of the sutures. It is the opposite of the horse-shoe head.

HEAD'PIECE, n. s. Head and piece. Armour for the head; helmet; understanding; force of mind.

> 'Tis done by some severals Of *headpiece* exraordinary, lower messes Perchance are to this business purblind. Shakspeare.

Eumenes had the best headpicee of all Alexander's captains. Prideaux.

I pulled off my *headpiece*, and humbly entreated her pardon, or knowledge why she was cruel.

Sidney.

The word is given; with eager speed they lace The shining *headpiece*, and the shield embrace.

Dryden.

This champion will not come into the field, before his great blunderbuss can be got ready, his old rusty breastplate scoured, and his cracked headpiece mended. Swift.

A reason for this fiction of the one-eyed Cyclops, was their wearing a *headpiece*, or martial vizor, that had but one sight. Broome.

HEAD'QUARTERS, n.s. Head and quarters. The place of general rendezvous, or lodgment for soldiers. This is properly two words.

The horse made their escape to Winchester, the headquarters. Clarendon

Those spirits, posted upon the out-guards, immediately scour off to the brain, which is the headquarters, or office of intelligence, and there they make their report. Collier.

HEAD'SHIP, n. s. From head. Dignity; authority; chief place.

HEAD'SMAN, n. s. Head and man. Executioner; one that cuts off heads.

Rods broke on our associates' bleeding backs, And *headsmen* lab'ring 'till they blunt their ax ?

Dryden.

HEAD'STALL, n. s. Head and stall. Part of the bridle that covers the head.

His horse, with a half-checked bit, and a headstall of sheep's leather, which, being restrained to keep him from stumbling, hath been often burst, and now repaired with knots. Shakspeare.

HEAD'STONE, n. s. Head and stone. The first or capital stone.

The stone, which the builders refused, is become the *headstone*. Psa. exviii. 24.

HEAL, v. a. & v. n.	Sax. pælan, from
HEAL'ER, n. s.	peel; Goth. halgan;

HEALTH'LESS, adj. J dom from pain or sickness as to the body; as to the mind, welfare; purity; goodness; salvation: also a wish for happiness, used in drinking: healthful, wholesome; salutary: healthless, weak; sickly; infirm; that which is not conducive to health.

Our father is in good health, he is yet alive.

Genesis. My God, my God, why hast thou forsaken me, and art so far from my health, and from the words of my complaint? Psalms.

I will not be an *healer*. Thou hast no *healing* medicines.

Jer. xxx. 13.

Isaiah.

I will restore *health*, and *heal* thee of thy wounds. Jer. xxx.

ther n'is erthe, water, fire, ne aire, Ne creature that of hem maked is,

That may me hele or don comfort in this.

Chaucer. The Knightes Tale. For now is Palamon in alle wele,

Living in blisse, in richesse, and in hele. Id.

To us surgiens apperteineth, that we do to every wight the best that we can ; wher as we ben witholden, and to our patient that we do no damage, wherfore it happeth many a time and ofte, that whan twey men han, everich, wounded other o same surgien heleth Chaucer. Tale of Melibeus. hem both.

Shall I not then be stifled in the vault, To whose foul mouth no healthsome air breathes in, And there be strangled ere my Romeo comes ? Shakspeare.

May be he is not well ;

Infirmity doth still neglect all office,

Whereto our health is bound.

Those wounds heal that men do give themselves. Id.

Come, love and health to all;

I drink to the' general joy of the whole table. Id. Such an exploit have I in hand,

Had you an healthful ear to hear it. Id.

Many good and healthful airs do appear by habitation and proofs, that differ not in smell from other Bacon. airs.

The best preservative to keep the mind in health, is the faithful admonition of a friend. Id.

He asked leave to begin two healths: the first was to the king's mistress, and the second to his wife. Howel.

Nothing in Nature's sober found

But an eternal health goes round. Cowley. He that spends his time in sports, is like him whose garment is all made of fringes, and his meat nothing but sauces ; they are healthless, chargeable, and useless. Taulor.

While they pervert pure nature's healthful rules To loathsome sickness; worthily since they God's image did not reverence in themselves.

Milton.

Our healthful food the stomach labours thus, At first embracing what it strait doth crush.

Dryden.

For peace at home, and for the public wealth, I mean to crown a bowl to Cæsar's health. Id.

Gardening or husbandry, and working in wood, are fit and healthy recreations for a man of study or business. Locke.

Adam knew no disease, so long as temperance from the forbidden fruit secured him : Nature was his physician, and innocence and abstinence would have kept him healthful to immortality. South.

The husbandman returns from the field, and from manuring his ground, strong and healthy, because innocent and laborious. Id.

Who would not believe that our Saviour healed the sick, and raised the dead, when it was published by those who themselves often did the same miraeles? Addison.

To the winds the inhabitants of Geneva ascribe the healthfulness of their air; for as the Alps surround them on all sides, there would be a constant stagnation of vapours, did not the north wind put them in motion. Id. on Italy.

Health is the faculty of performing all actions proper to a human body, in the most perfect manner. Quincy.

Air and exercise contribute to make the animal healthy. Arbuthnot.

After separation of the eschar, I deterged and Wiseman. healed.

A fontanel had been made in the same leg, which he forced to heal up, by reason of the pain. Id.

Temperance, industry, and a publick spirit, running through the whole body of the people in Holland, hath preserved an infant commonwealth, of a sickly constitution, through so many dangers, as a much

more healthy one could never have struggled against without those advantages. Swift.

Physicians, by just observations, grow up to an honourable degree of skill in the art of healing.

Watte.

Here the great masters of the healing art, These mighty mock-defrauders of the tomb,

Spite of their juleps and catholicons,

Resign to fate ! Blair's Grave. From labour health, from health contentment springs,

Contentment opes the source of every joy. Beattie.

And so all ye, who would be in the right In health and purse, begin your day to date From day-break. Byron. Don Juan.

HEALFANG, HEALSFANG, OF HALSFANG, [from halp, neck, and pangen, to contain, Sax.] in the ancient English customs, signifies collistrigium, or the punishment of the pillory : Pæna scilicet qua alicui collum stringatur. Healfang is also taken for a pecuniary punishment or mulct, to commute for standing in the pillory; and is to be paid either to the king or the chief lord. Qui falsum testimonium dedit, reddat regi vel terræ domino healfang.

HEALTH. See MEDICINE.

HEALTH OF MARINERS, METHODS OF PRE-SERVING THE. See SEAMEN.

HEAM, in beasts, the same as the afterbirth in women. Thyme, penny-royal, winter savory, and common hore-hound, boiled in white wine, and given to a mare, are esteemed good to expel the heam. Dittany, applied in a pessary, expels the heam, as well as the dead foal; so also do fennel, hops, savin, angelica, &c.

HEAP, n. s. & v.a. Sax. peap; Dut. and HEAP'ER, n. s. Scot. hoop; Swed. hop.

The primary idea is ac-HEAP'Y, adj. cumulation; a crowd; a throng; a cluster: to throw together; to lay up or hoard; to add : any thing lying on heaps.

Though the wicked heap up silver as the dust, and raiment as the clay; the just shall put it on, and the innocent shall divide the silver. Job xxvii. 16.

Heap on wood, kindle the fire. Ezek. xxiv. 10.

The dead were fallen down by heaps, one upon another. Wisd. xviii. 23.

And if that Love aught let his bridel go,

Al that now loveth, asonder should lepe-

And lost were al that Love halt now to hepe.

Chaucer. Troilus and Cresside.

For those of old,

And the late dignities heaped up to them,

We rest your hermits. Shakspeare. The way to lay the city flat,

And bury all which yet distinctly ranges,

In heaps and piles of ruin.

Įd. A eruel tyranny; a heap of vassals and slaves, no freemen, no inheritance, no stirp or ancient families. Bacon.

How great the credit was, wherein that oracle was preserved, may be gathered from the vast riches which were there heaped up from the offerings of all the Greeian nations. Temple.

They who will make profession of painting, must heap up treasures out of their reading, and there will find many wonderful means of raising themselves above others. Dryden.

An universal ery resounds aloud ;

The sailors run in heaps, a helpless crowd. Id.

94

Id.

Huge heaps of slain around the body rise. At her feet were laid

The sceptres of the earth, exposed on heaps, To chuse where she would reign. Id.

Venice in its first beginnings had only a few heaps Addison on Italy. of earth for its dominions. To exult

Even o'er an enemy oppressed, and heap

Affliction on the afflicted, is the mark And the mean triumph of a dastard soul.

Id. Cato.

95

Id.

Where a dim gleam the paly lanthorn throws O'er the mid pavement, heapy rubbish grows. Gay. Scarce his head

Raised o'er the heapy wreath, the branching elk Lies slumbering sullen in the white abyss.

Thomson.

HEAR, v. a. & v.n.) Sax. bypan, beancman; Goth. heyra; Teut. hoe-HEAR'ER, n. S. ran; Belg. hooran. The HEAR'ING, n. s. difference between hear HEARK'EN, V. n. and hearken: to hear is HEARK'ENER, n.S. simply the act of the ear; HEAR'SAY, n. S.

to hearken, an act of the ear and mind, implying effort voluntarily made. Hear has the following meanings :--- To enjoy the sense by which sounds are distinguished; to listen; to be told; to perceive ; give audience ; to obey ; to attend favorably; to try; to attend; to acknowledge a title: hearer, one who attends discourses orally delivered ; one of an audience : hearken, to listen eagerly or curiously; to attend: hearsay, rumor; report.

Hearken unto me, thou son of Zippor. Numbers. Hear the causes and judge righteously.

Deut. i. 16.

In our hearing the king charged thee, beware that 2 Sam. xviii. 12. none touch Absalom. Proverbs.

A scerner heareth not rebuke. Hear the word at my mouth, and give them warn-Ezek. iii. 17. ing from me.

I was bowed down at the hearing of it; I was dismayed at the seeing of it. Hosea.

They think they shall be heard for their much speaking. Matthew.

I have heard by many of this man. Acts, ix. 13. Agrippa and Bernice entered into the place of hearing. Acts.

He sent for Paul, and heard him concerning the Id. xxiv. 24. faith in Christ.

To-day if ye will hear his voice, harden not your Hebrews. hearts.

But only for the fece thus she cried,

And wept, that it wos pitee for to here.

Chaucer. The Knightes Tale. Ful swetely herde he confession,

And plesant was his absolution.

Id. Prologue to the Canterbury Tales. Now let us ride and herkeneth what I say, And with that word we riden forth our way ; And he began with a right mery chere, His tale anon, and saide as ye shul here.

While that this king sit thus in his nobley, Herking his ministralles hir thinges pley, Beforne him at his bord delisiously In at the halle dore, al sodenly, Ther came a knight upon a stede of bros.

Id. The Squieres Tale.

Id.

St. John and St. Matthew, which have recorded these sermons, heard them; and being hearers, did think themselves as well respected as the Pharisees. Hooher.

Words, be they never so few, are too many, when they benefit not the hearer. Id

If we profess, as Peter did, that we love the Lord, and profess it in the hearing of men ; charity is prone to hear all things, and therefore charitable men are likely to think we do so. Id.

He affirmed, by hearsay, that some giants saved themselves upon the mountain Baris in Armenia.

Raleigh's History. The hearers will shed tears,

And say, Alas! it was a piteous deed!

Shakspeare.

Tell thou the lamentable fall of me, And send the hearers weeping to their beds. Id. The youngest daughter, whom you hearken for, Her father keeps from excess of suitors. Id.

Id.

He hearkens after prophecies and dreams. They do me too much injury,

That ever said I hearken for your death. If it were so, I might have let alone

The' insulting hand of Douglas over you.

Id. The French ambassador upon that instant

Craved audience; and the hour, I think, is come To give him a hearing. Id.

You have been talked of since your travels much, And that in Hamlet's hearing, for a quality

Wherein they say you shine. Id. Hamlet. Bees are called with sound upon brass, and there-

fore they have hearing. Bacon's Nat. Hist. Plays in themselves have neither hopes nor fears ;

Their fate is only in their hearers' ears. Ben Jonson.

Since 'tis your command, what you so well Are pleased to hear, I cannot grieve to tell.

Denham.

Id.

Or hearest thou rather pure ethereal stream, Milton. Whose fountain who shall tell?

So spake our mother Eve, and Adam heard, Well pleased, but answered not. Id.

Great laughter was in heaven, And looking down, to see the hubbub strange,

And hear the din. Milton. On earth

Who against faith or conscience can be heard Id. Infallible ?

And so was she dulled withal, that we could come so near as to hear her speeches, and yet she not perceive the hearers of her lamentation. Sidney.

For prey these shepherds two he took,

Whose metal stiff he knew he could not bend With hearsay pictures, or a window look. Id.

The readers are the jury to decide according the merits of the cause, or to bring it to another hearing Dryden. before some other court.

The gaping three-mouthed dog forgets to snarl; The furies hearken, and their snakes uncurl. Id.

Louder and yet more loud, I hear the alarms Of human cries :

I mount the terrass, thence the town survey,

And hearken what the fruitful sounds convey.

And sure he heard me, but he would not hear. Id.

The fox had the good luck to be within hearing. L'Estrange.

This, of eldest parents, leaves us more in the dark, who, by divine institution, has a right to civil power, than those who never heard any thing at all of heir or descent. Locke.

Those who put passion in the place of reason, neither use their own, nor hearhen to other people's reason, any farther than it suits their humour. Id.

I must beg the forbearance of censure, till I have Id. been heard out in the sequel of this discourse.

Hear of such a crime

As tragic poets, since the birth of time,

Ne'er feigned. Tate's Juvenal.

Those of different principles may be betrayed to give you a fair *hearing*, and to know what you have to say for yourself. Addison.

All the little scramblers after fame fall upon him, publish every blot in his life, and depend upon hearsay to defame him. Id.

Hearest thou submissive, but a lowly birth ?

Prior.

Sound is nothing but a certain modulation of the external air, which, being gathered by the external air, beats, as is supposed, upon the membrana tympani, which moves the four little bones in the tympanum: in like manner, as it is beat by the external air, these little bones move the internal air which is in the tympanum and vestibulum; which internal air makes an impression upon the auditory nerve in the labyrinth and cochlea, according as it is moved by the little bones in the tympanum: so that, according to the various reflections of the external air, the internal air makes various impressions upon the auditory nerve, the immediate organ of hearing; and these different impressions represent different sounds. Quincy.

He who makes much necessary, will want much; and, wearied with the difficulty of the attainment, will *hearken* after any expedient that offers to shorten his way to it. *Rogers.* Vice *heard* his fame, she read his bill,

Vice heard his tame, she read his Convinced of his inferior skill

She sought his booth, and from the crowd

Defyed the man of art aloud. Gay's Fables. The goddess heard. Pope:

There's not a blessing individuals find,

But some way leans and hearkens to the kind. Id. Her hearers had no share

In all she spoke, except to stare. Swift.

Hear it not ye stars,

And thou pale moon ! turn paler at the sound.

Young.

All Nature fades extinct; and she alone Heard, felt, and seen possesses every thought Fills every sense, and pants in every vein.

Thomson. And her voice was the warble of a bird, So soft, so sweet, so delicately clear,

That finer, simpler music ne'er was *heard*: The sort of sound we echo with a tear,

Without knowing why-an overpowering tone Whence melody descends as from a throne.

Byron.

HEARD signifies a keeper, and is sometimes initial; as heard-heart a glorious keeper: sometimes final, as cyneheard, a royal keeper.—Gibson's Camden. It is now written herd; as cowherd, a cow-keeper; Saxon byr.

HEARD (Sir Isaac), the late venerable garter principal king at arms, was born at Ottery St. Mary in Devonshire, December 10th, 1730. He entered early in life into the naval service, and had a narrow escape for his life on the coast of Africa, by falling overboard with the mainmast of the ship; but was saved by the exertions of a companion, Kingsmill, who afterwards became an admiral. In 1759, being only a midshipman, he was appointed by the favor of the earl of Effingham the acting earl marshal, blue mantle pursuivant of arms. In 1761 he was made Lancaster herald; in 1774 Norroy; in 1780 Clarencieux, by patent: and in 1784 garter principal

king at arms. At the first chapter held in 1786 he was knighted. At the age of eighty-four Sir Isaac went to Brussels, where he invested the king of the Netherlands with the order of the garter; and thence to Vienna, to perform the same ceremony to the emperor of Austria. The last public service in which he engaged was that of attending the funeral of his late majesty, with whom he had been a great favorite. Sir Isaac died at the heralds' college, April 29th 1822, having seen, with the infant of the prineess Charlotte, six generations of the Brunswick family. He was buried in St. George's Chapel at Windsor.

HEARNE (Thomas), a learned antiquary, and classical editor, was born at White Waltham Berkshire, where his father was parish clerk and school-master about 1678. After acquiring a knowledge of Latin and Greek, he was taken into the house of a Mr. Cherry, of Shottesbrooke, with whom the celebrated Henry Dodwell then resided, to whose instructions Hearne appears to have been indebted. He was sent in 1696 to Edmund Hall, Oxford, where he was employed by Dr. Mill and Dr. Grabe in the collation of MSS., and obtained his degrees in arts: in 1701 he was made assistant to Dr. Hudson, the keeper of the Bodleian library, when he greatly improved Hyde's catalogue of that literary collection. In 1712 he was appointed second librarian; and in 1715 architypographer and esquire beadle of the civil law; but he soon resigned these offices, through serupling to take the oath of allegiance to George He however continued to reside at Edmund Hall, where he died June 10th 1735. His labors were almost exclusively those of an editor, in which character he merits the praise of accuracy and fidelity. He published editions of Livy, Justin, and Eutropius; but his publications chiefly consist of the monastic and other ancient chronicles of our history. Among the rarest is the Aets of the Apostles in Greek and Latin, from a MS. in the Bodleian library.

HEARNE (Thomas), was born in 1744, at Binkworth, in Wiltshire, and learned the art of engraving from the ingenious Woollet; but did not afterwards follow that profession; being engaged by Sir Ralph Payne, governor of the Leeward Islands, to go out with him as a draughtsman. On his return to England he applied to the study of Gothic architecture and landscape; and, in conjunction with Mr. Byrne, undertook the Antiquities of Great Britain, for which he made the whole of the drawings. He seldom attempted bold scenery, but for truth and chasteness of coloring has soldom been surpassed. He was a member of the Society of Antiquaries: and the leader of all that is excellent in modern landscape painting in water colors. He died April 13th, 1818.

HEARSE, or HERSE, *n. s.* Barb. Lat. *hersia*; or Goth. *hirda*, to environ, or enclose. A carriage in which the dead are conveyed to the grave; a temporary monument set over a grave.

To add to your laments Wherewith you now bedew king Henry's hearse, I must inform you of a dismal sight. Shakspeare. Underneath this marble herse

Lies the subject of all verse. Ben Jonson. And as they Nature's cradle decked,

Will in green age her hearse expect. Marvell.

HEART, n. s. Sax. peopz; Swed. hard; Teut. hertz. The musele which by its contraction and dilatation propels the blood through the course of circulation, and is therefore considered as the source of vital motion. It is supposed in popular language to be the seat sometimes of courage, sometimes of affection, sometimes of honesty or baseness. The chief part; the vital part; the vigorous or efficacious part; the inner part of any thing. Person; character; used with respect to courage or kindness. Seat of love; affection; inclination; memory: though South seems to distinguish. Good-will; ardor of zeal. To take to heart any thing is to be zealous or solicitous or ardent about it. Anxiety; concern; secret recesses of the mind; disposition. The heart is considered as the seat of tenderness: a hard heart therefore is cruelty. To find in the heart, to be not wholly averse. Secret meaning or intention; conscience; strength; vigor; efficacy; the utmost degree of feeling; life. For my heart seems sometimes to signify, if life were at stake; and sometimes for tenderness. This word is much used in composition with other words to which it gives the idea of cordiality, or extreme of feeling; as in the following examples.

Joab perceived that the king's heart was towards Absalom. 2 Sam.

Michal saw king David leaping and dancing before the Lord, and she despised him in her heart.

Id. vi. 16.

- What pretty man is this That rometh here ? now, truly, drinke ne mete Nede I not have, mine herte for joye doth bete Him to beholde, so is he godely freshe; It seemeth, for love, his herte is tendre and neshe. Chaucer. The Court of Love.

Wide was the wound ; and a large lukewarm flood, Red as the rose, thence gushed grievously,

That when the painim spyed the streaming blood, Gave him great heart and hope of victory.

Spenser. Faerie Queene. There did other like unhappy accidents happen out of England, which gave heart and good opportunity to them to regain their old possessions.

Spenser.

Every man's heart and conscience doth in good or evil, even secretly committed, and known to none but itself, either like or disallow itself. Hooker.

If he take not their causes to heart, how should there be but in them frozen coldness, when his affections seem benumbed, from whom theirs should take fire ? Id.

This gay charm,

Like a right gipsy, hath, at fast and loose, Beguiled me to the very heart of loss.

Shakspeare.

Set your heart at rest ;

The fairy land buys not the child of me. Id. Thou wouldest have left thy dearest heart blood there,

Rather than made that savage duke thine heir, And disinherited thine only son. Id.

I thank you for my venison, master Shallow. -Master Page, much good do it your good heart.

Id.

Snakes in my heart blood warmed, that sting my heart. Id.

Our battle is more full of names than yours, Our men more perfect in the use of arms, Our armour all as strong, our cause the best : Then reason wills our hearts should be as good. Id.

I will on with my speech in your praise, And then shew you the heart of my message. Id.

I bid the rascal knock upon your gate. And could not get him for my heart to do it.

I gave it to a youth,

A prating boy, that begged it as a fee :

I could not for my heart deny it him.

Id. The king's a bawcock, and a heart of gold.

A lad of life, an imp of fame. Id. Hey, my hearts; cheerly my hearts. Id.

What says my heart of elder ? Ha! is he dead ?

I.I.

I've seen thee stern, and thou hast oft beheld Heart-hardening spectacles. Id.

Whatsoever was attained to, concerning God and his working in nature, the same was delivered over by heart and tradition from wise men to a posterity equally zealous. Raleigh.

Try whether leaves of trees, swept together, with some chalk and dung mixed, to give them more heart, would not make a good compost. Bacon.

If he would take the business to heart, and deal in it effectually, it would succeed well. Id.

Barley being steeped in water, and turned upon a dry floor, will sprout half an inch; and if it be let alone, much more, until the heart be out. Id.

The king's forces are employed in appeasing disorders more near the heart of the kingdom.

Hayward.

Id.

Means how to feel, and learn each other's heart, By the' abhot's skill of Westminster is found.

Daniel.

The lady marchioness of Hertford engaged her hushand to take this business to heart. Clarendon.

Amongst those who took it most to heart, Sir John Stawell was the chief. Id.

Having left that city well provided, and in good heart, his majesty removed with his little army to İd.

Bewdley. Eve, recovering heart, replyed. Milton.

Thus over-fond, on that which is not thine. Id. Profoundly skilled in the black art,

Hudibras. As English Merlin for his heart. He with providence and courage so passed over all, that the mother took such spiteful grief at it, that her heart brake withal, and she died. Sidney.

For my breaking the laws of friendship with you, I could find in my heart to ask you pardon for it, but that your now handling of me gives me reason to confirm my former dealing. Id.

If it please you to make his fortune known, I will after take heart again to go on with his falsehood.

Id.

Doing all things with so pretty a grace, that it seemed ignorance could not make him do amiss, because he had a heart to do well. Id.

Every moment

I'm from thy sight, the heart within my hosom Moans like a tender infant in its cradle, Whose nurse had left it.

Otway. Venice Preserved. Generally the inside or heart of trees is harder than the outward parts, Boyle,

H

A friend makes me a feast, and sets all before me, but I set my *heart* upon one dish alone, and if that happen to be thrown down, I scorn all the rest. *Temple*.

The expelled nations take *heart*, and when they fly from one country invade another. Id.

Then mixing powerful herbs with magick art, She changed his form who could not change his heart. Dryden,

What did I not, her stubborn heart to gain?

But all my vows were answered with disdain. Id. That the spent earth may gather heart again,

And, bettered by cessation, bear the grain. *Id* Here in the *heart* of all the town I'll stay,

And timely succour where it wants convey. Id.

We all set our hearts at rest, since whatever comes

from above is for the best. L'Estrange. 'Tis well to be tender; but to set the heart too

much upon any thing is what we cannot justify. Id.

Finding that it did them no hurt, they took heart upon't, went up to't, and viewed it. Id.

Would you have him open his heart to you, and ask your advice, you must be in to do so with him first, Locke,

We call the committing of a thing to memory the getting it by *heart*; for it is the memory that must transmit it to the *heart*; and it is in vain to expect that the *heart* should keep its hold of any truth, when the memory has let it go. South.

Every prudent and honest man would join himself to that side which had the good of their country most at *heart*. Addison.

Such iron hearts we are, and such

The base barbarity of human kind. Rowe.

Learned men have been now a long time searching after the happy country from which our first parents were exiled : if they can find it, with all my heart. Woodward.

Ah. what avails it me the flocks to keep, Who lost my *heart* while I preserved my sheep! *Pope*.

Shall I in London act this idle part?

Composing songs for fools to get by heart. Id.

Men, some to pleasure, some to business take ; But every woman is, at *heart*, a rake. Id.

Prest with *heart*-corroding grief and years, To the gay court a rural shed prefers. *Id.*

I would not be sorry to find the Presbyterians mistaken in this point, which they have most at *heart*.

Swift.

What I have most at *heart* is, that some method should be thought on for ascertaining and fixing our language. Id.

Care must be taken not to plow ground out of heart, because if 'tis in heart, it may be improved by marl again. Mortimer.

A fonder parent Nature never knew, And as his age increased his fondness grew. A parent's love ne'er better was bestowed ;

The pious daughter in her heart o'erflowed.

Young. Force of Religion. Not kings alone,

ot kings alone,

Each villager has his ambition too; No sultan prouder than his fettered slave; Slaves build their little Babylons of straw, Echo the proud Assyrian in their hearts, And cry---' Behold the wonders of my night.' Id. Night Thoughts,

But these thou must renounce, if lust of wealth E'er win its way to thy corrupted *heart*;

For ah! it poisons like a scorpion's dart. Beuttie. O cruel! will no pang of pity pierce

That heart by lust of lucre seared to stone ? Id.

The heart is like the sky, a part of heaven,

But changes night and day too, like the sky; Now o'er it clouds and thunder must be driven,

And darkness and destruction as on high . But when it hath been scorched, and pierced, and riven.

Its storms expire in water-drops ; the eye

Pours forth at last the heart's-blood turned to tears, Which make the English climate of our years. Byron. Don Juan.

See ANATOMY, Physi-HEART. Index. ologists and anatomists have from time to time attempted to make estimates of the force of the blood in the heart and arteries; but have differed as widely from each other, as they have from the truth, for want of sufficient data. This set the ingenious Dr. Hales upon making proper experiments, to ascertain the force of the blood in the veins and arteries of several animals. If, according to Dr. Keil's estimate, the left ventricle of a man's heart throws out in each systole an ounce or 1.638 cubic inches of blood, and the area of the orifice of the aorta be ± 0.4187 , then, dividing the former by this, the quotient 3.9 is the length of the cylinder of blood which is formed in passing through the aorta in each systole of the ventricle; and, in the seventy-five pulses of a minute, a cylinder of 292.5 inches in length will pass: this is at the rate of 1462 feet in an hour. But, the systole of the heart being performed in one-third of this time, the velocity of the blood in that instant will be thrice as much, viz. at the rate of 4386 feet in an hour, or seventy-three feet in a minute. And if the ventricle throws out one ounce in a pulse, then, in the seventy-five pulses of a minute, the quantity of blood will be equal to 4.4 lbs. 11 oz.; and in thirty-four minutes a quantity equal to a middle-sized man, viz. 158 lbs. will pass through the heart. But if, with Dr. Harvey and Dr. Lower, we suppose 2 oz. of blood, that is 3.276 cubic inches, to be thrown out at each systole of the ventricle, then the velocity of the blood in entering the orifice of the aorta will be double the former, viz. at the rate of 146 feet in a minute, and a quantity of blood equal to the weight of a man's body will pass in half the time, viz. seventeen minutes. If we suppose, what is probable, that the blood will rise $7 + \frac{1}{2}$ feet high in a tube fixed to the carotid artery of a man, and that the inward area of the left ventricle of his heart is equal to fifteen square inches, these, multiplied into $7 \times \frac{1}{2}$ feet, give 1350 cubic inches of blood, which presses on that ventricle, when it first begins to contract a weight equal to 15.5 lbs. What Dr. Hales thus calculated from supposition, with regard to mankind, he actually experimented upon horses, dogs, fallow-does, &c., by fixing tubes in orifices opened in their veins and arteries; by observing the several heights to which the blood rose in these tubes as they lay on the ground; and by measuring the capacities of the ventricles of the heart and orifices of the arteries. And, that the reader may the more readily compare the said estimates together, he has given a table of them, ranged in the following order.

49

The several animals.	Weight of each.	Height of the blood in the tube from the jugu- lar vein.	Height of the blood in rubes fixed to arteries.	Capacity of the left ven- tricle of the heart.	Area of the orifice of the aorta.	Velocity of the blood in the aorta.	Quantities of blood equal to the weight of the animal, in what time.	How much in a minute.	Weight of the blood sus- tained in the left ven- tricle contracting.	No. of pulses in a minute.	Area of transverse section of descending aorta.	Arca of the transverse section of ascending aorta.
	Pounds.	Inches.	Feet. Inches.	Cubie Inches.	Square inches.	Feet and inches in a minute.	Minutes.	Pounds.	Pounds.		Square inclues.	Square inches.

HEART'-ACH, n. s. HEART'-BREAK, n. s. HEART'-BREAKER, n. S. HEART'-BREAKING, adj., n.s. HEART'-BURNED, adj. HEART'-BURNING, n. s. HEART'-RENDING, adj. HEART'-ROBBING, adj. HEART'-SICK, adj. HEART'-SORE, adj. HEART'-STRUCK, adj. HEART'-SWELLING, adj. HEART'-WOUNDED, adj. HEART'-WOUNDING, adj. HEART'-DEAR, adj. HEART'-EASE, n. s. HEART'-EASING, adj. HEART'-FELT, adj. HEART'-QUELLING, adj. HEART'-STRING, n. s. HEART'-WHOLE, adj. HEART'S'-EASE, n. s. HEART'-PEASE, n. s.

Compounds of heart with other words, for the most part expressing their own peculiar meanings. and implying various degrees of suffering or pleasure, sorrow or discontent. Heartburn, pain at the stomach arising from acidity, and figuratively secret discontent or enmity : heartdear, sincerely beloved; heartquelling, conquering the af-

fection; heart-robbing, eestatic to a degree depriving of thought; heart-string, ligaments or nerves supposed to sustain the heart, properly the vessels by which it is suspended; heartwhole, affections yet unfixed, or vitals yet unimpaired; the other words are too obvious to require specific illustration. Heart-breaker is an obsolete word or cant term for a woman's curls, supposed to break the heart of all her lovers; heart's-ease, the name of a flower; heart-pcase, a plant. Those piteous plaints and sorrowful sad time, Which late you poured forth, as ye did sit Beside the silver springs of Helicone, Making your musick of *heart-breaking* mone.

Spenser.

Wherever he that godly knight may find, His only heart-sore and his only foe.

Id. Faerie Queene.

Drawn into arms, and proof of mortal fight, Through proud ambition and heart-swelling hate. Spenser.

Sweet as thy virtue, as thyself sweet art; For when on me thou shinedst, late in sadness, A melting pleasance ran through every part, And me revived with *heart-robbing* gladness. Id.

And let fair Venus, that is queen of love, With her heart-quelling son, upon you smile. Id.

He was by Jove deprived

Of life himself, and heart-strings of an eagle rived. Id.

Better a little chiding than a great deal of heartbreak. Shakspeare.

Who is with him?

-None but the fool who labours to outjest His heart-struck injuries. Id.

What infinite heart-ease must kings neglect, That private men enjoy! Id.

Good Romeo, hide thyself.

---Not I, unless the breach of *heart-sick* groans Mist-like, infold me from the search of eyes.

Id.

To die—to sleep— No more; and, by a sleep, to say the end, The *heart-ach*, and the thousand natural shocks That flesh is heir to, *Id. Hamlet.*

H 2

Shakspeare.

100

How, out of tune on the strings ?

-Not so; but yet so false, that he grieves my very Id. Leart-strings. Cupid hath clapt him o' th' shoulder, but I'll war-

Id. rant him heart-whole.

- The time was, father, that you broke your word, When you were more endeared to it than now;
- When your own Percy, when my heart-dear Harry, Threw many a northward look to see his father

Bring up his powers ; but he did long in vain !

Id.

What greater heart-breaking and confusion can there be to one, than to have all his secret faults laid open, and the sentence of condemnation passed upon Hakewill. him?

If we be heart-sick, or afflicted with an uncertain soul, then we are true desirers of relief and mercy. Taylor.

If thou thinkest thou shalt perish, I cannot blame

thee to be sad 'till thy heart-strings crack. Id. That grates my heart-strings; what should dis-

content him ? Except he thinks I live too long. Denham.

He added not; for Adam, at the news

Heart-struck, with chilling gripe of sorrow stood, That all his senses bound ! Milton. But come, thou goddess, fair and free,

In heav'n ycleped Euphrosyne,

Id. And by men heart-easing mirth. Like Samson's heart-breakers, it grew

In time to make a nation rue. Hudibras. Heart rending news, and dreadful to those few

Who her resemble, and her steps pursue ;

That death should licence have to rage among

The fair, the wise, the virtuous, and the young Waller.

You have not seen me yet, and therefore I am confident you are heart-whole. Dryden.

Heart's-ease is a sort of violet that blows all Summer, and often in Winter : it sows itself. Mortimer.

Fine clean chalk is one of the most noble absorbents, and powerfully corrects and subdues the acrid humours in the stomach : this property renders it very serviceable in the cardialgia, or heart-burning.

Woodward.

There's the fatal wound

That tears my heart-strings ; but he shall be found, My arms shall hold him. Granville.

What nothing earthly gives, or can destroy,

The soul's calm sun-shine, and the heart-felt joy, Is virtue's prize. Pope.

Mean time the queen, without reflection due, Heart-wounded, to the bed of state withdrew. Id.

In great changes, when right of inheritance is broke, ther will remain much heart-burning and discontent among the meaner people. Swift.

HEART-BURN, in medicine, is more usually called cardialgia. In surfeits, or upon swallowing without due mastication. or when by any accident the saliva is vitiated, too scanty, or not intimately mixed with the food, the fermentation. becomes tumultuous, the stomach swells with air, and this extraordinary commotion, being attended with an unusual heat, brings on the uneasiness called the heart-burn : which is remedied by whatever promotes a greater secretion of saliva, or helps to mix it with our aliment. The testaceous powders, as oyster-shells, chalk, &c., are the usual remedies for the heart-burn.

HEART'ED, adj. HEART'EN, v.a. HEARTI'LY, adv. HEARTI'NESS, n. s. HEART'LESS, adj. HEART'LESSLY, adv. HEART'LESSNESS, n.s. HEART'Y, adj. HEARTY-HALE, adj.

Derived from heart. Hearted, an epithet which derives its force from the words with which it is joined, implying intensity of feeling, as lion-hearted; hard-hearted : hearten, J to encourage, animate,

or renovate : heartily, cordially; fully; sincerely; eagerly: heartless implies defect in these qualities, as spiritless; cowardly; without feeling; dejected:hearty, undissembled; zealous; healthy; strong; vigorous; durable. Hearty-hale, good for the heart; an old word.

'Nay, Sire !' quod he, ' but swiche thing as I can With hertly wille, for I wol not rebelle

Agein your lust, a tale wol I telle.

Have me excused if I speke amis :

My wille is good ; and lo, my tale is this.' Chaueer. The Squieres Tale. " Avoy,' quod she ; ' fy on you herteles !

Alas,' guod she, ' for, by that God above, Now han ye lost myn herte and all my love;

I cannot love a coward, by my faith.

Id. The Nonnes Preestcs Talc.

Vein-healing verven, and head-purging dill,

Sound savory, and basil hearty hale. Spenser. I joyed oft to chase the trembling pricket, Or hunt the heartless have 'till she were tame. Id.

Then hopcless, heartless, 'gan the cunning thief,

Persnade us die, to stint all further strife. Faerie Queene.

My royal father, cheer these noble lords,

And hearten those that fight in your defence :

Unsheath your sword, good father ; cry, St. George.

Shakspeare.

What, art thou drawn among these heartless hinds? Turn thee, Benvolio ; look upon thy death. Id.

I bear no malice for my death ; But those that sought it, I could wish more Christians;

Be what they will, I heartily forgive them. Id.

This entertainment may a free face put on : derive a liberty from heartiness, and well become the agent. Id.

This rare man, Tydides, would prepare ; Chapman.

That he might conquer, heartened him. Oak, and the like true hearty timber, being strong in all positions, may be better trusted in cross and transverse works. Wotton.

The ground one year at rest ; forget not then

With richest dung to hearten it again. May's Virgil. Thousands besides stood mute and heartless there,

Men valiant all; nor was I used to fear. Cowley.

The anger of an enemy represents our faults, or admonishes us of our duty, with more heartiness than the kindness of a friend. Taulor.

They did not bring that hearty inclination to peace, which they hoped they would have done.

Clarendon.

Palladius blaming those that were slow, heartening them that were forward, but especially with his own example leading them, made an impression into the squadron. Sidney.

The peasants were accustomed to payments, and grew heartless as they grew poor. Temple.

Heartless they fought, and quitted soon their ground,

While ours with easy victory were crowned. Dryden.

But the kind hosts their entertainment grace With hearty welcome and an open face ;

Id.

In all they did, you might discern with ease A willing mind, and a desire to please.

Thus heartened well, and fleshed upon his prey, The youth may prove a man another day. Id.

As for my eating heartily of the food, know that anxiety has hindered my eating 'till this moment. Addison.

If to he sad is to he wise,

I do most heartily despise

Whatever Socrates has said,

Or Tully writ, or Wanley read. Prior.

He ne'er like bullies coward hearted, Attacks in publick to be parted. Gay.

Where his judgment led him to oppose men on a publick account, he would do it vigorously and heartily; yet the opposition ended there. Atterbury.

Whose laughs are *hearty*, though his jests are coarse,

And loves you best of all things but his horse. Pope. Every man may pretend to any employment, provided he has been loud and frequent in declaring himself hearty for the government. Swift.

HEARTH, n.s. Sax. beop5; Swed. hard; Teut. herd. The pavement of a room on which a fire is made; the ground under the chimney.

Hooped out of Rome : now this extremity Hath brought me to this hearth. Shakspeare.

Cricket, to Windsor chimneys shalt thou leap, Where thou findest fires unraked, and *hearths* unswept.

There pinch the maids as blue as bilberry. Id. Good luck befriend thee, son; for at thy birth

The fairy ladies danced upon the hearth. Milton. The vanquished fires withdraw from every place;

Or, full with feeding, sink into a sleep :

Each household genius shews again its face,

And from the hearths the little lares creep. Dryden.

HEAT, n. s. & v. a. } Sax. bear, bær; Dan. HEAT'ER, n. s. } heete. The sensation caused by the approach or touch of fire; the cause of this sensation; hot weather; state of any body under the action of fire; a violent action unintermitted; a course at a race; pimples in the face; agitation; vehemence of action; passion; faction; ardor: to warm, either literally or figuratively; to agitate the blood and spirits with action; heater, an iron made hot, and put into a box-iron, to smooth linen.

He commanded that they should *heat* the furnace one seven times more than it was wont to be *heated*. Dan. iii. 19.

Nowe hote as fire, nowe cold as ashes ded; Nowe hote for colde, now colde for hete again;

Now cold as yse; and now, as coles red,

For hete I brenne. And thus betwixen twaine,

I possed am and al forcaste in paine,-

So that my hete, full plainly as I fele,

Of grevous colde is caused every dele !

Chaueer. Complaint of the Blacke Knight. The sword which is made fiery doth not only cut by reason of the sharpness which simply it hath, but also burns by means of that *heat* which it hath from fire. *Hooker*.

The friend hath lost his friend;

And the best quarrels, in the heat, are curst

By those that feel their sharpness. *Shakspeare*. They are in a most warlike preparation, and hope to come upon them in the *heat* of their division. *Id*.

Thou art going to Lord Timon's feast.

-Ay, to see meat fill knaves, and wine heat fools.

After they came down into the valley, and found the intolerable *heats* there, and knew no means of lighter apparel, they were forced to go naked. Bacon.

Where now he flings about his burning heat As in a furnace some ambitious fire

Whose vent is stopt. Ben Jonson. The cold and heat Winter and Summer shows;

Autumn by fruits, and Spring by flowers he knows. Cowley.

Virtue's a faint green-sickness to brave souls, Dastards their hearts, their active heat controls. Marvell.

They, seing what forces were in the city with them, issued against the tyrant while they were in this *heat*, before practices might be used to dissever them.

Sidney.

Mark well the flowering almonds in the wood; The glebe will answer to the sylvan reign; Great heats will follow, and large crops of grain. Druden.

Feigned zeal, you saw, set out the speedier pace; But the last *heat*, plain dealing won the race. Id. A noble emulation *heats* your breast,

And your own fame now robs you of your rest. Id.

The continual agitations of the spirits must needs be a weakening of any constitution, especially in age: and many causes are required for refreshment betwixt the *heats*. Id.

What can more gratify the Phrygian foe

Than those distempered heats?

I'll stake my fortune with him at a heat,

And give him not the leisure to forget. Id. When he was well *heated* the younger champion could not stand before him; and we find the elder contended not for the gift, but for the honour.

Id.

Id.

Heat is a very brisk agitation of the insensible parts of the object, which produces in us that sensation from whence we denominate the object hot; so what in our sensation is *heat*, in the object is nothing but motion. Locke.

Hops lying undried heats them, and changes their colour. Mortimer.

The heats smiths take of their iron are a blood-red heat, a white flame heat, and a sparkling or welding heat. Moxon.

They the turned lines on golden anvils beat, Which look as if they struck them at a *heat*.

Tate.

It might have pleased in the *heat* and hurry of his rage, but must have displeased in cool sedate reflection. South.

Plead it to her

With all the strength and *heat* of eloquence Fraternal love and friendship can inspire.

Addison's Cato.

We have spilt no blood but in the *heat* of the battle, or the chase. Atterbury.

Whatever increaseth the density of the blood, even without increasing its celerity, *heats*, because a denser body is hotter than a rarer. Arbuthnot.

One playing at hazard, drew a huge heap of gold; hut in the *heat* of play never observed a sharper, who swept it into his hat. Swift.

The word heat is used to signify the sensation we have when we are near the fire, as well as the cause of that sensation, which is in the fire itself: and thence we conclude, that there is a sort of heat in the fire resembling our own sensation. Watts.

Yet could I seat me by this ivied stone Till I had bodied forth the *heated* mind,

Forms from the floating wreek which ruin leaves behind. Byron's Childe Harold. HEAT, in physiology, is a term that has been used both for the peculiar sensation felt on the approach of bodies in a state of combustion, and for the cause of that sensation: in which last sense it is synonymous with fire. In the former sense it is opposed to cold. In modern science the term fire has been abandoned; but the term heat is generally taken for the supposed natural agent that produces the sensation we call by this name; for a great second cause, therefore, of some of the most important operations of nature, or as synonymous with the term caloric.

The great question among philosophers of modern times has been whether this is to be regarded as a distinct subtile fluid, or entity; or whether it is a property of matter universally diffused, and operating in a vibratory or intestine motion of its particles. The latter is the opinion of Sir Humphry Davy on this intricate point; and, as he has many claims to our attention on such a subject, we shall here transcribe his views respecting it. Calorific repulsion,' he says, 'has been accounted for, by supposing a subtile fluid capable of combining with bodies, and of separating their parts from each other, which has been named the matter of heat, or caloric.

' Many of the phenomena admit of a happy explanation on this idea, such as the cold produced during the conversion of solids into fluids or gases, and the increase of temperature connected with the condensation of gases and fluids.' In the former case we say the matter of heat is absorbed or combined, in the latter it is extruded or disengaged from combination. 'But there are other facts which are not so easily reconciled to the opinion. Such are the production of heat by friction and percussion; and some of the chemical changes which have been just referred to.' These are, the violent heat produced in the explosion of gunpowder, where a large quantity of aëriform matter is disengaged ; and the fire which appears in the decomposition of the euchlorine gas, or protoxide of chlorine, though the resulting gases occupy a greater volume.

"When the temperature of bodies is raised by friction, there seems to be no diminution of their capacities, using the word in its common sense; and in many chemical changes, connected with an increase of temperature, there appears to be likewise an increase of capacity. A piece of iron made red-hot, by hammering, cannot be strongly heated a second time by the same means, unless it has been previously introduced into a fire. This fact has been explained by supposing that the fluid of heat has been pressed out of it, by the percussion, which is recovered in the fire; but this is a very rude mechanical idea: the arrangements of its parts are altered by hammering in this way, and it is rendered brittle. By a moderate degree of friction, as would appear from Rumford's experiments, the same piece of metal may be kept hot for any length of time; so that if heat be pressed out, the quantity must be inexhaustible. When any body is cooled, it occupies a smaller volume than before; it is evident, therefore, that its parts must have approached to each other: when the body is

expanded by heat, it is equally evident that its parts must have separated from each other. The immediate cause of the phenomena of heat, then, is motion, and the laws of its communication are precisely the same as the laws of the communication of motion.

Since all matter may be made to fill a smaller volume, by cooling, it is evident that the particles of matter must have space between them; and since every body can communicate the power of expansion to a body of a lower temperature, that is, can give an expansive motion to its particles, it is a probable inference that its own particles are possessed of motion; but, as there is no change in the position of its parts as long as its temperature is uniform, the motion, if it exist, must be a vibratory or undulatory motion, or a motion of the particles round their axes, or a motion of particles round each other.

' It seems possible to account for all the phenomena of heat, if it be supposed that in solids the particles are in a constant state of vibratory motion, the particles of the hottest bodies moving with the greatest velocity, and through the greatest space; that in liquids and elastic fluids, besides the vibratory motion, which must be conceived greatest in the last, the particles have a motion round their own axes, with different velocities, the particles of elastic fluids moving with the greatest quickness; and that in ethereal substances, the particles move round their own axes, and separate from each other, penetrating in right lines through space. Temperature may be conceived to depend upon the velocities of the vibrations; increase of capacity, on the motion being performed in greater space; and the diminution of temperature, during the conversion of solids into fluids or gases, may be explained on the idea of the loss of vibratory motion, in consequence of the revolution of particles round their axes, at the moment when the body becomes liquid or aëriform; or from the loss of rapidity of vibration, in consequence of the motion of the particles through greater space.

' If a specific fluid of heat be admitted, it must be supposed liable to most of the affections which the particles of common matter are assumed to possess, to account for the phenomena; such as losing its motion when combining with bodies, producing motion when transmitted from one body to another, and gaining projectile motion when passing into free space; so that many hypotheses must be adopted to account for its agency, which renders this view of the subject less simple than the other. Very delicate experiments have been made, which show that bodies, when heated, do not increase in weight. This, as far as it goes, is an evidence against a subtile elastic fluid producing the calorific expansion ; but it cannot be considered as decisive, on account of the imperfection of our instruments. A cubical inch of inflammable air requires a good balance to ascertain that it has any sensible weight, and a substance bearing the same relation to this, that this bears to platinum, could not perhaps be weighed by any method in our possession.

Sir William Herschel, and Sir H. Englefield, on the other hand, have been supposed to

establish the materiality of caloric: or at least to have made it appear co-existent with light. Herschel found that when similar thermometers were placed in the different parts of the solar beam, decomposed by the prism into the primitive colors, they indicated different temperatures. He estimates the power of heating in the red rays to be to that of the green rays as fifty-five to twenty-six, and to that of the violet rays as fifty-five to sixteen. And in a space beyond the red rays, where there is no visible light, the increase of temperature is greatest of all. Thus a thermometer in the full red ray rose 7° Fahr. in ten minutes; beyond the confines of the colored beam entirely, it rose in an equal time 9°. His experiments were repeated by Sir H. Englefield.

Mr. Berard, however, came to a conclusion somewhat different. To render his experiments more certain, and their effects more sensible, this philosopher availed himself of the heliostat, an instrument by which the sunbeam can be steadily directed to one spot during the whole of its diurnal period. He decomposed by a prism the sunbeam, reflected from the mirror of the heliostat, and placed a sensible thermometer in each of the seven colored rays. The calorific faculty was found to increase progressively from, the violet to the red portion of the spectrum, in which the maximum heat existed, and not be-The vond it, in the unilluminated space. greatest rise in the thermometer took place while its bulb was still entirely covered by the last red rays; and it was observed progressively to sink as the bulb entered into the dark. Finally, on placing the bulb quite out of the visible spectrum, where Herschel fixed the maximum of heat, the elevation of its temperature above the ambient air was found, by M. Berard, to be only onefifth of what it was in the extreme red ray. He afterwards made similar experiments on the double spectrum produced by Island crystal, and also on polarised light, and he found in both cases that the calorific principle accompanied the luminous molecules; and that, in the positions where light ccased to be reflected, heat also disappeared.

Newton has shown that the different refrangibility of the rays of light may be explained by supposing them composed of particles differing in size, the largest being at the red, and the smallest at the violet extremity of the spectrum. The same great man has put the query, Whether light and common matter are not convertible into each other? and, adopting the idea that the phenomena of sensible heat depend upon vibrations of the particles of bodies, supposes that a certain intensity of vibrations may send off particles into free space; and that particles in rapid motion in right lines, in losing their own motion, may communicate a vibratory motion to the particles of terrestrial bodies. In this way we can readily conceive how the red rays should impinge most forcibly, and therefore excite the greatest degree of heat. This controversy on the nature of heat is, therefore, far from being settled. There is little room, as Dr. Ure has observed, for being dogmatic on either side. But, if the essence of this most important cause be

hid in mystery, we are well acquainted with many of its properties and effects. We shall, in this paper, chiefly attend to them as displayed — I. In the distribution of heat, II. In the general sympathies of heat with the different forms of matter.

PART I.

OF THE DISTRIBUTION OF HEAT.

Newton, in his Opuscula, suggests a law respecting the communication of heat which has long served as a basis for the calculation of philosophers. He assumes, a priori, that a heated body exposed to a constant cooling cause, such as the uniform action of a current of air, ought to lose at each instant a quantity of heat proportional to the excess of its temperature above that of the ambient air; and that consequently its losses of heat, in equal and successive portions of time, ought to form a decreasing geometrical progression. Martin, in his Essays on Heat, pointed out, however, long ago the inaccuracy of this law, and Erxleben proved, by very accurate observations, that the deviation of the supposed law increases more and more as we consider greater differences of temperatures : he concludes that we should fall into very great errors if we extended the law much beyond the temperature at which it has been verified. Yet Mr. Leslie since, in his Researches on Heat, has made this law the basis of several determinations; and Messrs. Dulong and Petit have investigated the true law in a masterly manner.

They employed in this research mercurial thermometers, whose bulbs were from 0.8 of an inch to 2.6; the latter containing about three pounds of mercury. They found, by preliminary trials, that the ratio of cooling was not affected by the size of the bulb, and that it held also in comparisons of mercury, with water, with absolute alcohol, and with sulphuric acid, through a range of temperature from 60° to 30° of the centigrade scale; so that the ratio of the velocity of cooling between 60° and 50°, and 40° and 30°, was sensibly the same. On cooling water in a tin plate, and in a glass sphere, they found the law of cooling to be more rapid in the former, at temperatures under the boiling point; but, by a very remarkable casualty, the contrary effect takes place in bodies heated to high temperatures, when the law of cooling in tin plates becomes least rapid. Hence, generally, that which cools by a most rapid law at the lower part of the scale, becomes the least rapid at high temperatures. Mr. Leslie, says these gentlemen, obtained such inaccurate results respecting this question, because he did not make experiments on the cooling of bodies raised to high temperatures. They terminate their preliminary researches by experiments on the cooling of water in three tin-plate vessels of the same capacity, the first of which was a sphere, the second and third cylinders; from which we learn that the law of cooling is not affected by the difference of shape.

The researches on cooling in a vacuum were made with an exhausted balloon; and a compensation was calculated for the minute quantity of residuary gas. The following series was ob-

tained when the balloon was surrounded with ice. The degrees are centigrade.

Excess of the therm. above the balloon.	Corresponding velocities of cooling.		
240	10.69		
220	8.81		
200	7.40		
180	6.10		
160	4.89		
140	3.88		
120	3.02		
100	2.30		
80	1.74		

The first column contains the excesses of temperature above the walls of the balloon; that is to say, the temperatures themselves, since the balloon was at 0°. The second column contains the corresponding velocities of cooling, calculated and corrected. These velocities are the numbers of degrees that the thermometer would sink in a minute. The first series shows clearly the inaccuracy of the geometrical law of Richmann; for, according to that law, the velocity of cooling at 200° should be double of that at 100°; whereas we find it as 7.4 to 2.3, or more than triple; and in like manner, when we compare the loss of heat at 240° and at 80°, we find the first about six times greater that the last; while, according to the law of Richmann, it ought to be merely triple. From the above, and some analogous experiments, the following law has been deduced: when a body cools in vacuo, surrounded by a medium whose temperature is constant, the velocity of cooling for excess of temperature, in arithmetical progression, increases as the terms of a geometrical progression, diminished by a certain quanty. Or, expressed in algebraic language, the following equation contains the law of cooling in vacuo;

$$V = m. \ a \ (a - 1)$$

 θ is the temperature of the substance surrounding the vacuum; and t that of the heated body above the former. The ratio a of this progression is easily found for the thermometer, whose cooling is recorded above; for when θ augments by 20°, t remaining the same, the velocity of cooling is then multiplied by 1.165, which number is the mean of all the ratios experimentally determined. We have then

$$a \equiv \sqrt{1.165} \equiv 1.0077.$$

It only remains, in order to verify the accuracy of this law, to compare it with the different series contained in the table inserted above. In that case, in which the surrounding medium was 0°, it is necessary to make $m \equiv 2.037$, for $m \equiv \frac{n}{\log a}$, and *n* is an intermediate number; we have then $V \equiv \frac{t}{2.037} (a = 1)$.

10.69	10.68
8.81	8.89
7.40	7.34
6.10	6.03
4.89	4.87
3.88	3.89
3.02	3.05
2.30	2.33
1.74	1.72
	8.81 7.40 6.10 4.89 3.88 3.02 2.30

The laws of cooling in vacuo being known, nothing is more simple than to separate from the total cooling of a body surrounded with air, or with any other gas, the portion of the effect due to the contact of the fluid. For this, it is obviously sufficient to subtract from the real velocities of cooling, those velocities which would take place if the body, cæteris paribus, were placed in vacuo. This subtraction may be easily accomplished now that we have a formula, which represents this velocity with great precision, and for all possible cases.

From numerous experimental comparisons the following law was deduced : the velocity of cooling a body, owing to the sole contact of a gas, depends for the same excess of temperature on the density and temperature of the fluid; but this dependence is such, that the velocity of cooling remains the same, if the density and the temperature of the gas change in such a way that the elasticity remains constant.

The influence of the nature of the surface of bodies, in the distribution of heat, was first accurately examined by Mr. Leslie. This branch of the subject is usually called the radiation of caloric. To measure the amount of this influence, with precision, he contrived a peculiar instrument, called a differential thermometer. It consists of a glass tube, bent into the form of the letter U, terminated at each end with a bulb The bore is about the size of that of large thermometers, and the bulbs have a diameter of one-third of an inch and upwards. Before hermetically closing the instrument a small portion of sulphuric acid, tinged with carmine, is introduced. The adjustment of this liquid, so as to make it stand at the top of one of the stems, immediately below the bulb, requires dexterity in the operator. To this stem a scale divided into 100 parts is attached, and the instrument is then fixed upright by a little cement on a wooden sole. If the finger, or any body warmer than the ambient air, be applied to one of these bulbs, the air within will be heated, and will of course expand, and, issuing in part from the bulb, depress before it the tinged liquor. The amount of this depression observed upon the scale will denote the difference of temperature of the two balls. But if the instrument be merely carried, without touching either ball, from a warmer to a cooler, or from a cooler to a warmer air, or medium of any kind, it will not be affected; because the equality of contraction or expansion,

in the enclosed air of both bulbs, will maintain the equilibrium of the liquid in the stem. Being thus independent of the fluctuations of the surrounding medium, it is well adapted to measure the calorific emanations of different surfaces, successively converged, by a concave reflector, upon one of its bulbs.

Dr. Howard has described, in the sixteenth number of the Journal of Science, a differential thermometer of his contrivance, which he conceives to possess some advantages. Its form is an imitation of Mr. Leslie's; but it contains merely tinged alcohol, or ether; the air being expelled by ebullition previous to the hermetical closure of the instrument. The vapor of ether, or of spirit in vacuo, affords, he finds, a test of superior delicacy to air. He makes the two legs of different lengths; since it is in some cases very convenient to have the one bulb standing quite aloof from the other.

In Mr. Leslie's, when they are on the same level, their distance asunder varies from one-third of an inch to an inch or upwards, according to the size of the instrument. The general length of the legs of the syphon is about five or six inches. His reflecting mirrors, of about fourteen inches diameter, consisted of planished tin-plate, hammered into a parabolical form by the guidance of a curvilinear gauge. A hollow tin vessel, six inches cube, was the usual source of calorific emanation in his experiments. He coated one of its sides with lamp-black, another with paper, a third with glass, and a fourth was left bare. Ilaving then filled it with hot water, and set it in the line of the axis and four or six feet in front of one of the mirrors, in whose focus the bulb of a differential thermometer stood, he noted the depression of the colored liquid produced on presenting the different sides of the tube towards the mirror in succession. The following table gives a general view of the results, with these, and other coatings :--

Lamp black		•		•	100
Water by esti	mate		•		100+
Writing paper	2		•		98
Resin .					96

Tarnished lea	d				45
Mercury	•				20+
Clean lead				•	19
Iron polished					15
Tin plate		•			12
Gold, silver,	coppe	er			12

Similar results were obtained by Leslie and Rumford in a simpler form.

Coating the bulb of his thermometer with different substances, Mr. Leslie ingeniously discovered the power of different substances to *absorb* heat; and he found this to follow the same order as the radiating or projecting quality. The same film of silver leaf which obstructs the egress of heat from a body to those surrounding it, prevents it from receiving their calorific emanations in return. On this principle we can understand how a metallic mirror, placed before a fire, should scorch substances in its focus, while itself remains cold; and, on the other hand, how a mirror of darkened, or even of silvered glass, should become intolerably hot to the touch while it throws little heat before it. From this absorbent faculty it comes that a thin pane of glass intercepts almost the whole heat of a blazing fire, while the light is scarcely diminished across it. By degrees indeed itself, becoming heated, constitutes a new focus of emanation; but still the energy of the fire is greatly interrupted. Hence also we see why the thinnest sheet of bright tinfoil is a perfect fire-screen; so impervious indeed to heat that, with a masque coated with it, our face may encounter without inconvenience the blaze of a glass-house furnace.

Since absorption of heat goes hand in hand with radiation, we perceive that the inverse of absorption, that is reflection, must be possessed in inverse powers by the different substances composing the list. Thus bright metals reflect most heat, and so on upwards in succession. Mr. Leslie is anxious to prove that elastic fluids, by their pulsatory undulations, are the media of the projection or radiation of heat; and that therefore liquids, as well as a perfect vacuum, should obstruct the operation of this faculty. But the laws of the cooling of bodies in vacuo, experimentally established by MM. Dulong and Petit, are fatal to Mr. Leslie's hypothesis, which indeed was not tenable against the numerous objections which had previously assailed it. The following beautiful experiment of Sir H. Davy seems alone to settle the question. He had an apparatus made by which platina wire could be heated in any elastic medium or in vacuo; and by which the effects of radiation could be distinctly exhibited by two mirrors, the heat being excited by a Voltaic battery. In several experiments, in which the same powers were employed to produce the ignition, it was found that the temperature of a thermometer rose nearly three times as much in the focus of radiation, when the air in the receiver was exhausted to $\frac{1}{120}$, as when it was in its natural state of condensation. The cooling power, by contact of the rarefied air, was much less than that of the air in its common state, for the glow of the platina was more intense in the first case than in the last; and this circumstance perliaps renders the experiment not altogether decisive; but the results seem favorable to the idea that the terrestrial radiation of heat is not dependent upon any motions or affections of the atmosphere. The plane of the two mirrors was placed parallel to the horizon, the ignited body being in the focus of the upper, and the thermometer in that of the under mirror. It is evident that a diminished density of the elastic medium, amounting to 120, should, on Mr. Leslie's views, have occasioned a greatly diminished temperature in the inferior focus, and not a threefold increase, as happened. The experiments with screens of glass, paper, &c., which Mr. Leslie adduced in support of his undulatory hypothesis, have been since confronted with the experiments on screens of Dr Delaroche, who, by varying them, obtained results incompatible with Mr. Leslie's views.

The constancy or steadiness of the temperature of a body will consist in the equality of the quantities of radiating caloric which it emits and receives in an equal time; and the equality of temperature between several bodies which influence one another, by their mutual radiation, will consist in the perfect compensation of the momentary interchanges effected among one and all. Such is the ingenious principle of a moveable equilibrium, proposed by professor Prevost: a principle, whose application, directed with discretion and combined with the properties peculiar to different surfaces, explains all the phenomena which we observe in the distribution of radiating caloric. Thus, when we put a ball of snow in the focus of one concave mirror, and a thermometer in that of an opposite mirror placed at some distance, we perceive the temperature instantly to fall, as if there were a real radiation of frigorific particles, according to the ancient notion. The true explanation is derived from the abstraction of that return of heat which the thermoscope mirror had previously derived from the one now influenced by the snow, and now participating in its inferior radiating tension. Thus, also, a black body placed in the focus of one mirror would diminish the light in the focus of the other; and, as Sir II. Davy happily remarks, the eye is, to the rays producing light, a measure, similar to that which the ther mometer is to rays producing heat.

This interchange of heat is finely exemplified in the relation which subsists between any por tion of the sky and the temperature of the subja cent surface of the earth. In the year 1788 Mr. Six of Canterbury mentioned, in a paper transmitted to the Royal Society, that on clear and dewy nights he always found the mercury lower in a thermometer laid upon the ground, in a meadow in his neighbourhood, than it was in a similar thermometer suspended in the air six feet above the former: and that upon one night the difference amounted to 5° of Fahrenheit's scale. And Dr. Wells, in autumn 1811, on laying a thermometer upon grass wet with dew, and suspending a second in the air two feet above the surface, found, in an hour afterwards, that the former stood 8° lower than the latter. He at first regarded this coldness of the surface to be the effect of the evaporation of the moisture; but subsequent observations and experiments convinced him that the cold was not the effect, but the cause of deposition of dew. Under a cloudless sky the earth projects its heat, without return, into empty space; but a canopy of cloud is a concave mirror, which restores the equilibrium by counter-radiation. See DEW.

On this principle Dr. Wollaston suggested the construction of an instrument, which professor Leslie has called an acthrioscope, whose function it is to denote the clearness and coolness of the sky. It consists of a polished metallic cup, of an oblong spheroidal shape, very like a silver porter-cup, standing upright, with the bulb of a differential thermometer placed in its axis, and the stem lying parallel to the stalk of the cup. The other ball is gilt, and turned outwards and

upwards, so as to rest against the side of the vessel. The best form of the cup is an ellipsoid, whose eccentricity is equal to half the transverse axis, and the focus consequently placed at the third part of the whole height of the cavity; while the diameter of the thermoscope ball should be nearly the third part of the orifice of the cup. A lid of the same thin metal, unpolished, is fitted to the mouth of the cup, and removed only when an observation is to be made. The scale attached to the stem of the thermoscope may extend to sixty or seventy millesimal degrees above the zero, and about fifteen degrees below it. This instrument, exposed to the open air in clear weather, will at all times, both during the day and the night, 'indicate an impression of cold shot downward from the higher regions,' in the figurative language of Mr. Leslie. Yet the effect varies exceedingly. It is greatest while the sky has the pure azure hue; it diminishes fast as the atmosphere becomes loaded with spreading clouds; and it is almost extinguished when low fogs settle on the surface. The liquid in the stem falls and rises with every passing cloud. Dr. Howard's modification of the thermoscope would answer well here.

The diffusion of heat, among the particles of fluids themselves, depends upon their specific gravity and specific heat conjunctly, and therefore must vary for each particular substance. The mobility of the particles in a fluid, and their reciprocal independence on one another, permit them to change their places whenever they are expanded or contracted by alternations of temperature; and hence the immediate and inevitable effect of communicating heat to the under stratum of a fluid mass, or of abstracting it from the upper stratum, is to determine a series of intestine movements. The colder particles, by their superior density, descend in a perpetual current, and force upwards those rarefied by the heat. When, however, the upper stratum primarily acquires an elevated temperature, it seems to have little power of imparting heat to the subjacent strata of fluid particles. Water may be kept long in ebullition at the surface of a vessel, while the bottom remains ice cold, provided we take measures to prevent the heat passing downwards through the sides of the vessel itself. Count Rumford became so strongly persuaded of the impossibility of communicating heat downwards, through fluid particles, that he regarded them as utterly destitute of the faculty of transmitting that power from one to another, and capable of acquiring heat only in individual rotation, and directly from a foreign source. The proposition thus absolutely announced is absurd, for we know that by intermixture, and many other modes, fluid particles impart heat to each other; and experiments have been instituted, which prove the actual descent of heat through fluids by communication from one stratum to another. But unquestionably this communication is amazingly difficult and slow. We are hence led to conceive, that it is an actual contact of particles which in the solid condition facilitates the transmission of heat so speedily from point to point through their mass. This contact of certain poles in the molecules is perfectly consistent

with void spaces, in which these molecules may slide over each other in every direction; by which movements or condensations heat may be excited. The fluid condition reverts or averts the touching and cohering poles, whence mobility results. This statement may be viewed either as a representation of facts, or an hypothesis to aid conception.

The transmission of heat through solids was made the subject of some popular experiments by Dr. Ingenhousz. He took a number of metallic rods of the same length and thickness, and, having coated one of the ends of them for a few inches with bees' wax, he plunged their other ends into a heated liquid. The heat travelled onwards among the matter of each rod, and soon became manifest by the softening of the wax. The following is the order in which the wax melted; and according to that experiment, therefore, the order of conducting power relative to heat :--

1. Silver.

2. Gold.

3. 4.		nearly equal.
	Platinum, Iron,	much inferior to
	Steel, Lead,	the others.

'In my repetition of the experiment, I found,' says Dr. Ure, 'silver by much the best conductor, next copper, then brass, iron, tin, much the same, then cast iron, next zinc, and, last of all, lead. Dense stones follow metals in conducting power, then bricks, pottery, and, at a long interval, glass. A rod of this singular body may be held in the fingers for a long time, at a distance of an inch from where it is ignited and fused by the blow-It is owing to the inferior conducting pipe. power of stone, pottery, glass, and cast-iron, that the sudden application of heat so readily cracks them. The part acted on by the caloric expands, while the adjacent parts, retaining their pristine form and volume, do not accommodate themselves to the change; whence a fissure must necessarily ensue. Woods and bones are better conductors than glass; but the progress of heat in them, at elevated temperatures, may be aided by the vaporisation of their juices. Charcoal and saw-dust rank very low in conducting power. Hence the former is admirably fitted for arresting the dispersion of heat in metal furnaces. If the sides of these be formed of double plates, with an interval between them of an inch filled with pounded charcoal, an intense heat may exist within, while the outside is scarcely affected. Morveau has rated the conducting power of charcoal to that of fine sand as two to three, a difference much too small. Spongy organic substances, silk, wool, cotton, &c., are still worse conductors than any of the above substances; and the finer the fibres, the less conducting power they possess. The theory of clothing depends on this principle. The heat generated by the animal powers is accumulated round the body by the imperfect conductors of which clothing is composed.'

To discover the exact law of the distribution of heat in solids we may take a prismatic bar of

iron, three feet long, and with a drill form three cavities in one of its sides, at ten, twenty, and thirty inches from its end, each cavity capable of receiving a little mercury, and the small bulb of a delicate thermometer. Cut a hole fitting exactly the prismatic bar, in the middle of a sheet of tin plate, which is then to be fixed to the bar, to screen it and the thermometers from the focus of heat. Immerse the extremity of the bar obliquely into oil or mercury heated to any known degree, and place the thermometers in their cavities surrounded with a little mercury. Or the bar may be kept horizontal, if an inch or two at its end be incurvated, at right angles to its length. Call the thermometers A, B, C. . Were there no dissipation of the heat, each thermometer would continue to mount till it attained the temperature of the source of heat. But, in actual experiments, projection and aërial currents modify that result, making the thermometers rise more slowly, and preventing them from ever reaching the temperature of the end of the bar. Their state becomes indeed stationary whenever the excess of temperature, each instant communicated by the preceding section of the bar, merely compensates what they lose by the contact of the succeeding section of the bar, and the other outlets of heat. The three thermometers now indicate three steady temperatures, but in diminishing progres-In forming an equation from the exsion. perimental results, M. Laplace has shown, that the difficulties of the calculation can be removed only by admitting, that a determinate point is influenced not only by those points which touch it, but by others at a small distance before and behind it. Then the laws of homogeneity, to which differentials are subject, are re-established, and all the rules of the differential calculus are observed. Now, in order that the calorific influence may thus extend to a distance in the interior of the bar, there must operate through the very substance of the solid elements a true radiation, analogous to that observed in air, but whose sensible influence is bounded to distances This result is in no incomparably smaller. respect improbable. In fact, Newton has taught us that all bodies, even the most opaque, become transparent when rendered sufficiently thin; and the most exact researches on radiating caloric prove, that it does not emanate solely from the external surface of bodies, but also from material particles situated within this surface, becoming no doubt insensible at a very slight depth, which probably varies in the same body with its temperature.

MM. Biot, Fourier, and Poisson, three of the most eminent mathematicians and philosophers of the age, have distinguished themselves in this abstruse investigation. The following is the formula of M. Biot, when one end of the bar is maintained at a constant temperature, and the other is so remote as to make the influence of the source insensible. Let y represent, in degrees of the thermometer, the temperature of the air by which the bar is surrounded; let the temperature of the focus be y + Y; then the in-

tegral becomes, log. $y \equiv \log Y - \frac{x}{M}$ V

x is the distance from the hot end of the bar, aand b are two co-efficients, supposed constant for the whole length of the bar, which serve to accommodate the formula to every possible case, and which must be assigned in each case, agreeably to two observations. M is the modulus of the ordinary logarithmic tables, or the number 2.302585. M. Biot presents several tables of observations, in which sometimes eight, and sometimes fourteen thermometers, were applied all at once to successive points of the bar; and then he computes by the above formula what ought to be the temperature of these successive points, having given the temperature of the source ; and vice versâ, what should be the temperature of the source, from the indications of the thermometers. A perfect accordance is shown to exist between fact and theory. Whence we may regard the view opened up by the latter, as a true representation of the condition of the bar. With regard to the application of this theorem, to discover, for example, the temperature of a furnace, by thrusting the end of a thermoscopic iron bar into it, we must regret its insufficiency. M. Biot himself, after showing its exact coincidence at all temperatures, up to that of melting lead, declares that it ought not to apply at high heats. But we see no difficulty in making a very useful instrument of this kind by experiment, to give very valuable pyrometrical indi-cations. The end of the bar which is to be exposed to the heat, being coated with fire-clay, or sheathed with platinum, should be inserted a few inches into the flame, and drops of oil being put into three successive cavities of the bar, we should measure the temperatures of the oil, when they have become stationary, and note the time elapsed to produce this effect. A pyroscope of this kind could not fail to give useful information to the practical chemist, as well as to the manufacturers of glass, pottery, steel, &c.

We shall insert here, from Dr. Ure, tabular views of the specific heats determined by the recent researches of the French chemists. MM Petit and Dulong remark, that, 'the attempts hitherto made to discover some laws in the specific heats of bodies have been entirely unsuccessful. We shall not be surprised at this, if we attend to the great inaccuracy of some of the measurements; for if we except those of Lavoisier and Laplace (unfortunately very few), and those by Laroche and Berard for elastic fluids, we are forced to admit, that the greatest part of the others are extremely inaccurate, as our own experiments have informed us, and as might indeed be concluded from the great discordance in the results obtained for the same bodies by different experimenters.' From this censure we must ex-cept the recent results of MM. Clement and Desormes on gases, which may be regarded as entitled to equal confidence with those of Berard and Delaroche.

TABLE I.—Of the Specific Heats of Gases, by M.M. BERARD and DELAROCHE.

 Equal volumes.	Equal weights.	Specific gravity,
1.0000	1.0000	1.0000
0.9033	12.3401	0.0732

The relative specific heat of air to water is, by M.M. Clement and Desormes, 0.250 to 1.000, or exactly one-fourth. The last table, which is extracted from the Journal de Physique, gives the specific heat of oxygen by Delaroche and Berard, a little different from their own number, Table 1. from the Annales de Chimie, vol. 85. The most remarkable result given by MM: Clement and Desormes regards carbonic acid, which, being reduced to the standard of weights, gives a specific heat compared to air of about 0.987 to 1.000, while oxygen is only 0.9000. The former tables of Crawford and Dalton give the specific heat of oxygen 2.65, and of carbonic acid 0.586, compared to air 1.000. And, upon these very erroneous numbers, they reared their hypothetical fabric of latent heat, combustion, and the animal temperature.

We see from the experiments on air, at different densities, that its specific heat diminishes in a much slower rate than its specific gravity. When air is expanded to a quadruple volume, its specific heat becomes 0.540, and, when expanded to eight times the volume, its specific heat is 0.368. The densities in the geometrical progression 1, $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, correspond nearly to the specific heats in the arithmetical series 5, 4, 3, 2. Hence also the specific heat of atmospherical air, and of probably all gases, consi-dered in the ratio of its weight or mass, diminishes as the density increases. On the principle of the increase of specific heat, relative to its mass, has been explained the long observed phenomenon of the intense cold which prevails on the tops of mountains, and generally in the upper regions of the atmosphere; and also that of the prodigious evolution of heat, when air is forcibly condensed. According to M. Gay Lussac, a condensation of volume, amounting to four-fifths, is sufficient to ignite tinder. If a syringe of glass be used, a vivid flash of light is seen to accompany the condensation.

TABLE IV.—Of Specific Heats of some Solids determined by DULONG and PETIT.

The above products, which express the capacities of the different atoms, approach so near equality, that the slight differences must be owing to slight errors, either in the measurement of the capacities, or in the chemical analyses, especially if we consider, that, in certain cases, these errors, derived from these two sources, may be on the same side, and consequently be found multiplied in the result. Each atom of these simple bodies seems, therefore, as was formerly stated, to have the same capacity for heat.

The question may here be asked, Whether a

body, in cooling a certain thermometric range at a high temperature, gives out the same quantity of heat that it does in cooling through the same range at a lower temperature? No means seem better adapted for solving this problem, than to measure the refrigeration produced, by the same weights of ice, on uniform weights of water, at different temperatures. Mr. Dalton found in this way, that '170'5° expresses the number of degrees of temperature, such as are found between 200° and 212° of the old or common scale, entering into ice of 32° to convert it into water of 32°; 150° of the same scale, between 122° and 130°, suffice for the same effect; and between 45° and 50°, 128° are adequate to the conversion of the same ice into water. These three resulting numbers (128, 150, 176.5), are nearly as 5, 6, 7. Hence it follows, that as much heat is necessary to raise water 5° in the lower part of the old scale, as is required to raise it 7° in the higher, and 6° in the middle.' See his New System of Chemical Philosophy, vol. i. p. 53.

' Mr. Dalton, however,' says Dr. Ure, 'instead of adopting the obvious conclusion, that the capacity of water for heat is greater at lower than it is at higher temperatures, and that therefore a smaller number of degrees at the former should melt as much ice as a great number at the latter, ascribes the deviation denoted by these numbers, 5, 6, and 7, to the gross errors of the ordinary thermometric graduation, which he considers so excessive, as not only to equal, but greatly to overbalance the really increased specific heat or capacity of water; which, viewed in itself, he conceives would have exhibited opposite experimental results. That our old, and, according to his notions, obsolete thermometric scale, has no such prodigious deviation from truth, is, I believe, now fully admitted by chemical philosophers; and therefore the only legitimate inference from these very experiments of Mr. Dalton is the decreasing capacity of water, with the inercase of its temperature. It deserves to be remarked, that my experiments on the relative times of cooling a globe of glass, successively filled with water, oil of vitriol, common oil, and oil of turpentine, give exactly the same results as Mr. Dalton had derived from mixtures of two ounces of ice with sixty of water, at different temperatures. This concurrence is the more satisfactory, since, when my paper on the specific heats of the above bodies, published in the Annals of Philosophy for October 1817, was written, I had no recollection of Mr. Dalton's experiments.'

TABLE V.-Of Capacities for Heat.

Mean capacity between 0° and 100°	Mean capacity between 0° and 3000°.
Mercury . 0.0330	0.0350
Zine . 0.0927	0.1015
Antimony . 0.0507	0.0549
Silver . 0.0557	0.0611
Copper . 0.0949	0.1013
Platinum . 0.0355	0.0355
Glass . 0.1770	0.1900

The capacity of iron was determined at the four following intervals :----

From	0° to 100°, the capacity is	s 0·1098
	0 to 200	0.1150
	0 to 300	0.1218
	0 to 350	0.1255

'If we estimate,' continues Dr. Ure, ' the temperatures, as some philosophers have proposed, by the ratios of the quantities of heat which the same body gives out in cooling to a determinate temperature, in order that this calculation be exact, it would be necessary that the body in cooling, for example, from 300° to 0°, should give out three times as much heat as in cooling from 100° to 0°. But it will give out more than three times as much, because the capacities are increasing. We should therefore find too high a temperature. We exhibit in the following table the temperatures that would be deduced by employing the different metals contained in the preceding table. We must suppose that they have been all placed in the same liquid bath at 300°, measured by an air thermometer.

Iron				332·2°
Mercury	,			318.2

PART II.

OF THE GENERAL SYMPATHIES OF HEAT WITH THE DIFFERENT FORMS OF MATTER.

The effects of heat are either transient and physical, or permanent and chemical, inducing a durable change in the constitution of bodies. The latter effect we have already treated of in our article COMBUSTION. The first is to be discussed here; and divides itself into the two heads, of changes in the volume of bodies while they retain their form, and changes in the state of bodies.

1. The successive *increments* of volume which bodies receive with successive increments of temperature, have been the subjects of innumerable researches. The expansion of fluids is so much greater than that of solids, by the same

elevation of their temperature, that it becomes an easy task to ascertain within certain limits the augmentation of volume which liquids and gases suffer through a moderate thermometric range. We have only to enclose them in a glass vessel of a proper form, and expose it to heat. But to determine their expansion with final accuracy, and free the results from the errors arising from the unequable expansion of the recipient, is a problem of no small difficulty. It seems, however, after many vain attempts by preceding experimenters, to have been finally solved by MM. Dulong and Petit. The expansion of solids had been previously measured with considerable accuracy by several philosophers, particularly by Smeaton, Roy, Ramsden, and Troughton, in this country, and Lavoisier and Laplace in France. The method devised by general Roy, and executed by him in conjunction with Ramsden, deserves the preference. The metallic or other rod, the subject of experiment, was placed horizontally in a rectangular trough of water, which could be conveniently heated. At any aliquot distance on the rod, two micrometer microscopes were attached at right angles, so that each being adjusted at first to two immoveable points, exterior to the heating apparatus, when the rod was elongated by heat, the displacement of the microscopes could be determined to a very minute quantity, to the twenty or thirty thousandth of an inch, by the micrometrical mechanism.

Dr. Ure, in the years 1812 and 1813, made, he tells us, many experiments with a microme-trical apparatus of a peculiar construction, for measuring the dilatation of solids. ' I was particularly perplexed,' he says, 'with the rods of zinc, which, after innumerable trials, I finally found to elongate permanently by being alternately heated and cooled. It would seem that the plates composing this metal, in sliding over each other by the expansive force of heat, present such an adhesive friction as to prevent their entire retraction. It would be desirable to know the limit of this effect, and to see what other metals are subject to the same change. I hope to be able, cre long, to finish these pyrometrical researches.' The doctor then gives us the following copious tables of dilatations, compiled from the best experiments :---

Dr. Young, in his valuable Catalogue Raisonnée, Natural Philosophy, vol. ii. p. 391, gives the following table of the expansions of water, constructed from a collation of experiments by Gilpin, Kirwan, and Achard. He says that the degrees of Fahrenheit's thermometer, reckoning either way from 30°, being called f, the expansion of water is nearly expressed by $22f^2$ (1 — $\cdot 002f$) in 10 millionths; and the diminution of the sp. gr. by $\cdot 0000022f^2 - \cdot 0000000472f^3$. This equation, as well as the table, is very important for the reduction of specific gravities of bodies, taken by weighing them in water.

M. Gay Lussac has lately endeavoured to discover some law which should correspond with the rate of dilatation of different liquids by heat. For this purpose, instead of comparing the dilatations of different liquids, above or below a temperature uniform for all, he set out from a point variable with regard to temperature, but uniform as to the cohesion of the particles of the bodies; namely, from the point at which each liquid boils under a given pressure. Among those which he examined, he found two which dilate equally from that point, viz. alcohol and sulphuret of carbon, of which the former boils at 173.14°, the latter at 115.9°, Fahrenheit. The other liquids did not present, in this respect, the same resemblance. Another analogy of the above two liquids is, that the same volume of each gives, at its boiling point, under the same atmospheric pressure, the same volume of vapor; or, in other words, that the densities of their vapors are to each other as those of the liquids at their respective boiling temperatures. The following table shows the results of this distinguished chemist :--

112

	Wa	ter.	Alcohol.		Sulphuret of Carb.		Ether.

TABLE of the Contractions of 1000 parts in volume, by cooling.

Their respective boiling points are :

Water	100 c	Cent. \pm 212° F.
Alcohol	78.41	173
Sulphuret of carb.	46.60	126
Sulphuric ether	35.66	96

The experiments were made in thermometer vessels hermetically sealed.

Alcohol, at 78.41° cent., produces 488.3 its volume of vapor.

Sulphuret of carbon, at 46.60° cent., produces 491.1 its volume of vapor.

Ether, at 35.66° cent., produces 285.9 its volume of vapor.

Water, at 100.00° cent., produces 1633.1 its volume of vapor.

Mr. Dalton has the merit of having first proved that the expansions of all aëriform bodies, when insulated from liquids, are uniform by the same increase of temperature; a fact of great importance to practical chemistry, which was fully verified by the independent and equally original researches of M. Gay Lussac on the subject, with a more refined and exact apparatus. The latter philosopher demonstrated that 100 in volume at 32° Fahrenheit, or 0° cent., became 1.375 at 212° Fahrenheit, or 100° cent. Hence the increment of bulk for each degree Fahrenheit is $\frac{0.375}{160} = 0.002083 = \frac{1}{480}$; and for the centigrade scale it is $\frac{0.375}{100} \equiv 0.00375 \equiv \frac{1}{260.6}$. To reduce any volume of gas, therefore, to the bulk it would occupy at any standard temperature, we must multiply the thermometric difference in degrees of Fahrenheit by 0.002083, or 1 subtracting the product from the given volume, if the gas be heated above, but adding it, if the gas be cooled below, the standard temperature. Thus twenty-five cubic inches at 120° Farenheit will at 60° occupy a volume of 217; for $\frac{1}{160} \times 60 = \frac{60}{160} = \frac{1}{8}$; and $\frac{25}{2} = 3\frac{1}{5}$, which, taken from 25, leaves 217. A table of reduction will be found under GAS. When the table is expressed decimally, indeed, to six or seven figures, it becomes more trouble-VOL. XI.

some to apply than the above rule. Vapors, when heated out of contact of their respective liquids, obey the same law as gases; a discovery due to M. Gay Lussac.

2. Of the change of state produced in bodies by caloric .- The three forms of matter, the solid, liquid, and gaseous, seem immediately referrible to the power of heat, modifying, balancing, or subduing cohesive attraction. The system of the world presents magnificent effects of attraction dependent on figure. Such are the pheno-mena of nutation and the precession of the equinoxes, produced by the attractions of the sun and moon on the flattened spheroid of the earth. These sublime phenomena would not have existed had the earth been a sphere : they are connected with its oblateness and rotation, in a manner which may be mathematically deduced, and subjected to calculation. The investigation shows, that this part of the attraction dependent on figure decreases more rapidly than the principal force. The latter diminishes as the square of the distance; the part dependent on figure diminishes as the cube of the distance. Thus also, in the attractions which hold the parts of bodies united, we ought to expect an analogous difference to occur. Hence the force of crystallisation may be subdued, before the principal attractive force is overcome. When the particles are brought to this distance, they will be indifferent to all the positions which they can assume round their centre of gravity; this will constitute the liquid condition. We must now content ourselves with stating the results as much as possible in a tabular form.

TABLE of the Concreting or Congealing Temperatures of various Liquids by FAHRENHEIT'S Scale.

The solidifying temperature of the bodies above tallow, in the table, is usually called their freezing or congcaling point; and of tallow, and the bodies below it, the fusing or melting point. Now, though these temperatures be stated, opposite to some of the articles, to fractions of a thermometric degree, it must be observed, that various circumstances modify the concreting point of the liquids, through several degrees; but the liquefying points of the same bodies, when once solidified, are uniform and fixed to the preceding temperatures.

Water, all crystallisable solutions, and the

three metals, cast-iron, bismuth, and antimony expand considerably in volume, at the instant of solidification. The greatest obstacles cannot resist the exertion of this expansive force. Thus, glass bottles, trunks of trees, iron and lead pipes, even mountain rocks, are burst by the dilatation of the water in their cavities, when it is converted into ice. In the same way our pavements are raised in winter. Major Williams of Quebec burst bombs, which were filled with water and plugged up, by exposing them to a freezing cold. The beneficial operation of this cause is exemplified in the comminution or loosening the texture of dense clay soils, by the winter's frost, whereby the delicate fibres of plants can easily penetrate them.

There is an important circumstance occurs in the preceding experiments on the sudden congelation of a body kept liquid below its usual congealing temperature, to which we must now advert. The mass, at the moment its crystallisation commences, rises in temperature to the term marked in the preceding table, whatever number of degrees it may have previously sunk below it. Suppose a globe of water suspended in an atmosphere at 21° Fahrenheit; the liquid will cool and remain stationary at this temperature, till vibration of the vessel, or contact of a spicula of ice, determines its concretion, wnen it instantly becomes 11° hotter than the surrounding medium. We owe the explanation of this fact, and its extension to many analogous chemical phenomena, to the sagacity of Dr. Black. His truly philosophical mind was particularly struck by the slowness with which a mass of ice liquefies when placed in a genial atmosphere. A lump of ice at 22° freely suspended in a room heated at 50°, which will rise to 32° in five minutes, will take 14 times 5, or seventy minutes to melt into water, whose temperature will be only 32°. Dr. Black suspended in an apartment two glass globules of the same size alongside of each other, one of which was filled with ice at 32°, the other with water at 33°. In half an hour the water had risen to 40°; but it took ten hours and a half to liquefy the ice, and heat the resulting water to 40°. Both these experiments concur, therefore, in showing that the fusion of ice is accompanied with the expenditure of 140° of calorific energy, which have no effect on the thermometer. For the first experiment tells us that 10° of heat entered the ice in the space of five minutes, and yet fourteen times that period passed in its liquefaction. The second experiment shows that 7° of heat entered the globes in half an hour; but twenty-one half hours were required for the fusion of the ice, and for heating of its water to 40°. If from the product of 7 into 21 ± 147 , we subtract the 7° which the water was above 33°, we have 140° as before. But the most simple and decisive experiment is to mingle a pound of ice in small fragments with a pound of water at 172°. Its liquefaction is instantly accomplished, but the temperature of the mixture is only 32°. Therefore, 140° of heat seem to have disappeared. Had we mixed a pound of ice-cold water with a pound of water at 172°, the resulting temperature would have been 102°, proving that the 70°

which had left the hotter portion, were manifestly transferred to that which was cooler. The converse of the preceding experiments may also be demonstrated; for on suspending a flask of water, at 35° for example, in an atmosphere at 20°, if it cool to 32° in three minutes, it will take 140 minutes to be converted into ice of 32°; because the heat, emanating at the rate of 1° per minute, it will require that time for 140° The latter experiment, however, to escape. from the inferior conducting power of ice, and the uncertainty when all is frozen, is not susceptible of the precision which the one immediately preceding admits. The tenth of 140 is obviously 14; and hence we may infer, that when a certain quantity of water, cooled to 22°, or 10° below 32°, is suddenly caused to congeal, 1-14th of the weight will become solid. We thus understand how the thaw which supervenes after an intense frost, should so slowly melt the wreaths of snow and beds of ice, a phenomenon observable in these latitudes from the origin of time, but whose explanation was reserved for Dr. Black. Indeed, had the transition of water from its solid into its liquid state not been accompanied by this great change in its relation to heat, every thaw would have occasioned a frightful inundation, and a single night's frost would have solidified our rivers and lakes. Neither animal nor vegetable life could have subsisted under such sudden and violent transitions.

Drs. Irvine, father and son, to both of whom the science of heat is deeply indebted, investigated the proportion of caloric disengaged by several other bodies in their passage from the liquid to the solid state, and obtained the following results :--

	Caloric of liquidity.	Do. referred to the specific heat of water.
Sulphur	143.68	27.14
Spermaceti	145.	
Lead	162.	5.6
Bees' wax	175.	
Zinc	493.	48.3
Tin	500.	33.
Bismuth	550.	23.25

The quantities in the second column are the degrees by which the temperatures of each of the bodies, in its solid state, would have been raised by the heat disengaged during its concretion. An exception must be made for wax and spermaceti; which are supposed to be in the fluid state, when indicating the above elevation.

Dr. Black supposed that the new relation to heat which solids acquire by liquefaction was derived from the absorption, and intimate combination, of a portion of that fluid, which, thus employing all its repulsive energies in subduing the stubborn force of cohesion, ceased to have any thermometric tension, or to be perceptible to our senses. He termed this supposed quantity of caloric, their latent heat; a term very convenient and proper, while we regard it simply

as expressing the relation which the calorific agent bears to the same body in its fluid and solid states. To the presence of a certain portion of latent or combined heat in solids, Dr. Black ascribed their peculiar degrees of softness, toughness, malleability. Thus we know that the condensation of a metal by the hammer, or under the die, never fails to render it brittle, while, at the same time, heat is disengaged. Berthollett subjected equal pieces of copper and silver to repeated strokes of a fly press. The elevation of their temperature, which was considerable by the first blow, diminished greatly at each succeeding one, and became insensible whenever the condensation of volume ceased, The copper suffered greatest condensation, and evolved most heat. Here the analogy of a sponge, yielding its water to pressure, has been employed to illustrate the materiality of heat supposed deducible from these experiments. But the phenomenon may be referred to the intestine actions between the ultimate particles which must accompany the violent dislocation of their attracting poles. The cohesiveness of the metal is greatly impaired.

The equilibrium between the attractive and repulsive forces, which constitutes the liquid condition of bodies, is totally subverted by a definite elevation of temperature, when the external compressing forces do not vary. The transition from the liquid state into that of elastic fluidity, is usually accompanied with certain explosive movements, termed ebullition. The peculiar temperature at which different liquids undergo this change is therefore called their boiling point; and the resulting elastic fluid is termed a vapor, to distinguish it from a gas, a substance permanently elastic, and not condensable as vapors are, by moderate degrees of refrigeration. It is evident that when the attractive forces, however feeble in a liquid, are supplanted by strong repulsive powers, the distances between the particles must be greatly enlarged. Thus a cubic inch of water at 40° becomes a cubic inch and 1-25th on the verge of 212°, and at 212° it is converted into 1694 cubic inches of steam. The existence of this steam indicates a balance between its elastic force and the pressure of the atmosphere. If the latter be increased beyond its average quantity, by natural or artificial means, then the elasticity of the steam will be partially overcome, and a portion of it will return to the liquid condition. And conversely, if the pressure of the air be less than its mean quantity, liquids will assume elastic fluidity by a less intensity of calorific repulsion, or at a lower thermometric tension, Professor Robison performed a set of ingenious experiments, which appear to prove, that when the atmospheric pressure is wholly withdrawn, that is, in vacuo, liquids become elastic fluids 124° below their usual boiling points. Hence, water in vacuo will boil and distil over at 212°-124 = 88° Fahrenheit. This principle was long ago employed by the celebrated Watt, in his researches on the steam-engine, and has been recently applied in a very ingenious way by Mr. Tritton in his patent still (Phil. Mag. vol. 51),

and Mr. Barry, in his evaporator for vegetable extracts (Med. Chir. Trans. vol. 10).

On the same principle of the boiling varying with the atmospheric pressure, the Rev. Mr. Wollaston has constructed his beautiful thermometric barometer for measuring heights. He finds that a difference of 1° in the boiling point of water is occasioned by a difference of 0.589 of an inch on the barometer. This corresponds to nearly 520 feet of difference of elevation. By using the judicious directions which he has given, the elevation of a place may thus be rigorously determined, and with great convenience. The whole apparatus weighing twenty ounces, packs in a cylindrical tin case, two inches diameter, and ten inches long.

When a vessel containing water is placed over a flame, a hissing sound or simmering is soon perceived. This is ascribed to the vibrations occasioned by the successive vaporisation and condensation of the particles in immediate contact with the bottom of the vessel. The sound becomes louder as the liquid is heated, and terminates in ebullition. The temperature becomes now of a sudden stationary when the vessel is open, however rapidly it rose before, and whatever force of fire be applied. Dr. Black set a tin cup full of water at 50° , on a red hot iron plate. In four minutes it reached the boiling point, and in twenty minutes it was all boiled off. From 50° to 212°, the clevation is 162° ; which interval, divided by 4, gives $40\frac{1}{2}^{\circ}$ of heat, which entered the tin cup per minute. Hence twenty minutes, or 5×4 multiplied into $40\frac{1}{2}$ \pm 810, will represent the quantity of heat that passed into the boiling water to convert it into a vapor. But the temperature of this is still only 212°. Hence, according to Black, these 810° have been expended solely in giving elastic tension, or, according to Irvine, in supplying the vastly increased capacity of the aëriform state; and therefore they may be denominated latent heat, being insensible to the thermometer. The more exact experiments of Mr. Matt have shown, that whatever period be assigned for the heating of a mass of water from 50° to 212°, six times this period is requisite with a uniform heat for its total vaporisation. But $6 \times 162^{\circ} = 972 =$ the latent heat of steam; a result which accords with Dr. Ure's experiments made in a different way. Every attentive operator must have observed the greater explosive violence and apparent difficulty of the ebullition of water exposed to a similar heat in glass, than in metallic vessels. M. Gay Lussac has studied this subject with his characteristic sagacity. He discovered that water boiling in a glass vessel has a temperature of 214.2°, and in a tin vessel contiguous to it, of only 212°. A few particles of pounded glass thrown into the former vessel, reduced the thermometer plunged in it to 212 6, and iron filings to 212°. When the flame is withdrawn for a few seconds from under a glass vessel of boiling water, the ebullition will recommence on throwing in a pinch of iron filings.

The following is a tabular view of the boiling points by Fahrenheit's scale of the most important liquids, under a mean barometrical pressure of thirty inches:-

These liquids emit vapors, which, at their respective boiling points, balance a pressure of the atmosphere equivalent to thirty vertical inches of mercury. But at inferior temperatures they yield vapors of inferior elastic power.

Mr. W. Creighton of Soho communicated, in March 1819, to the Philosophical Magazine, the following ingenious formula for aqueous vapor. Let the degrees of Fahrenheit $\times 85 \equiv$ D, and the corresponding force of steam in inches of mercury $-0.09 \equiv$ I. Then log. D -2.22679 $\times 6 \equiv \log$ I.

He then gives a satisfactory tabular view of the near correspondences between the results of his formula, and by experiments.

M. Gay Lussac, by determining experimentally the volume of vapor which a given volume of liquid can produce at 212°, has happily solved the very difficult problem of the specific gravity of vapors. He took a spherule of thin glass, with a short capillary stein, and of a known weight. He filled it with the peculiar liquid, hermetically sealed the orifice, and weighed it. Deducting from its whole weight the known weight of the spherule, he knew the weight, and from its specific gravity the bulk of the liquid. He filled a tall graduated glass receiver, capable of holding about three pints, with mercury, inverted it in a basin, and let up the spherule. The receiver was now

surrounded by a bottomless cylinder, which rested at its lower edge in the mercury of the basin. The interval between the two cylinders was filled with water. Heat was applied by means of a convenient bath, till the water and the included mercury assumed the temperature of 212°. The expansible liquid had ere this burst the spherule, expanded into vapor, and depressed the mercury. The height of the quicksilver column in the graduated cylinder above the level of the basin, being observed, it was easy to calculate the volume of the incumbent vapor. The quantity of liquid used was always so small, that the whole of it was converted into vapor.

vapor. The following exhibits the specific gravities as determined by the above method :---

	c. Gr. Air at 212°, <u>=</u> 1.	Boiling point, Fahrenheit.
Vapor of water	0.62349	212°
Hydroprussic acid .	0.94760	79.7
Absolute alcohol	1.6050	173
Sulphuric ether	2.5860	96
Hydriodic ether	5.4749	148
Oil of turpentine .	5 0130	316
Carburet of sulphur.	2.6447	116
Muriatic ether	2·2190 T	henard 52

The above specific gravities are estimated under a barometric pressure of 29.92 inches.

It appears, that a volume of water at 40° forms 1694 volumes of steam at 212°. The subsequent increase of the volume of steam, and of other vapors, out of the contact of their respective liquids, we formerly stated to be in the ratio of the expansion of gases, forming an addition to their volume of three-eighths for every 180° Fahrenheit. We can now infer, both from this expansion of one measure into 1694, and from the table of the elastic forces of steam, the explosive violence of this agent at still higher temperatures, and the danger to be apprehended from the introduction of water into the close moulds in which melted metal is to be poured. Hence, also, the formidable accidents which have happened, from a little water falling into heated oils. The little glass spherules, called candle bombs, exhibit the force of steam in a very striking manner; but the risk of particles of glass being driven into the eye, should cause their employment to be confined to prudent experimenters. Mr. Watt estimated the volumes of steam resulting from a volume of water at 1800; and in round numbers at 1728; numbers differing little from the above determination of M. Gay Lussac. Desagulier's estimate of 14,000 was therefore extravagant.

It has been already mentioned, that the caloric of fluidity in steam surpasses that of an equal weight of boiling water by about 972°. This quantity, or the latent heat of steam, as it is called, is most conveniently determined, by transmitting a certain weight of it into a given weight of water, at a known temperature, and, from the observed elevation of temperature in

the liquid, deducing the heat evolved during condensation. Dr. Black, Mr. Watt, Lavoisier, count Rumford, Clement, and Desormes, as well as Dr. Ure have published observations on the subject.

'Aqueous vapor of an elastic force balancing the atmospheric pressure,' says Dr. Ure, ' has a specific gravity compared to air, by the accurate experiments of M. Gay Lussac, of 10 to 16. For facility of comparison, let us call the steam of water unity, or 1.00; then the specific gravity of the vapor of pure ether is 4.00, while the specific gravity of the vapor of absolute alcohol is 2.60. But the vapor of ether, whose boiling point is not 100°, but 112°, like the above ether, contains some alcohol; hence we must accordingly diminish a little the specific gravity number of its vapor. It will then become, instead of 4.00, 3.55. Alcohol of 0.825 specific gravity contains much water; specific gravity of its vapor 2.30. That of water, as before unity, 1.00. The interstitial spaces in these vapors will therefore be inversely as these numbers, or $\frac{1}{355}$ for ether, $\frac{1}{230}$ for alcohol, $\frac{1}{100}$ for water. Hence, 353 of latent heat, existing in ethereal vapor, will occupy a proportional space, be equally condensed, or possess the same tension with $\frac{1}{230}$ in alcoholic, and $\frac{1}{100}$ in aqueous vapor. A small modification will no doubt be introduced by the difference of the thermometric tensions, or sensible heats, under the same elastic force. Common steam, for example, may be considered as deriving its total elastic energy from the latent heat multiplied into the specific gravity + the thermometric tension.

'Hence: the elastic force of the vapors of water, ether, and alcohol, are as follows :---

$$\begin{split} & E_{w} \equiv 970 \times 1.00 + 212^{\circ} \equiv 1182 \\ & E_{e} \equiv 302 \times 3.55 + 112^{\circ} \equiv 1184 \\ & E_{al} \equiv 440 \times 2.30 + 175^{\circ} \equiv 1185 \end{split}$$

Three equations, which yield, according to my general proposition, equal quantities. When the elastic forces of vapors are doubled, or when they sustain a double pressure, their interstices are proportionably diminished. We may consider them now as in the condition of vapors possessed of greater specific gravities. Hence the second portion of heat introduced to give double the elastic force, need not be equal to the first, in order to produce the double tension.

'This view accords with the experiments of Mr. Watt, alluded to in the beginning of the memoir. He found that the latent heat of steam is less when it is produced under a greater pressure, or in a more dense state; and greater when it is produced under a less pressure, or in a less dense state. Berthollet thinks this fact so unaccountable, that he has been willing to discard it altogether. Whether the view I have just opened, of the relation subsisting between the elastic force, density, and latent heat of different vapors, harmonise with chemical phenomena in general, I leave others to determine. It certainly agrees with that unaccountable fact. Whatever be the fate of the general law now respectfully offered, the statement of Mr. Watt may he implicitly received under the sanction of his acknowledged sagacity and candor.' Ure's Researches on Heat, pp. 54 & 55.

M. Clement inserted a pipe, connected with a steam boiler capable of bearing high pressure, into a given quantity of water at a certain temperature, contained in a bucket. He now turned the stop-cock on the pipe, and allowed a certain quantity of steam, at 212° Fahrenheit, to enter. He then noted the increase of temperature which the water had received. He repeated the experiment; only the steam in the boiler and that which issued through the pipe had been heated till its elasticity was double of that at 212°. As soon as the water in the bucket indicated, by its increase of volume, that the same quantity of steam had been condensed as in the first experiment, he shut the stop-cock and measured the temperature of the bucket. He found it to be the same as before. A third experiment with steam having an elastic force equal to three atmospheres, was next subjected to examination ; and he found the same result. Hence he inferred, that equal weights of steam, incumbent over water, at whatsoever temperature, contain the same quantity of heat; or, in popular language, that the total heat of steam is a constant quantity: for, in proportion as the sensible heat augments, the latent or specific heat diminishes. On this proposition he has founded a luminous theory of steam engines, which, we hope, he will soon present to the world in his promised Traité de Chaleur.

As it is the vastly greater relation to heat which steam possesses above water that makes the boiling point of that liquid so perfectly stationary in open vessels, over the strongest fires, we may imagine that other vapors, which have a smaller latent heat, may not be capable, by their formation, of keeping the ebullition of their respective liquids at a uniform temperature. This variation of the boiling point has been observed actually to happen with oil of turpentine, petroleum, and sulphuric acid. When these liquids are heated briskly in apothecaries' phials, they rise 20° or 30° above the ordinary point at which they boil in hemispherical capsules. Hence, also, their vapors, being generated with little heat, are apt to rise with explosive violence. Oil of turpentine varies, moreover, in its boiling point, according to its freshness and limpidity. It is needless therefore to raise an argument on a couple of degrees of differ-But, in Dr. Murray's, and in all our ence. other chemical systems, published prior to 1817, 560° was assigned as the boiling point of this volatile oil. Mr. Dalton's must be excepted, for he says, 'several authors have it, that oil of turpentine boils at 560°

Mr. Darwin has explained the production of snow on the tops of the highest mountains, by the precipitation of vapor from the rarefied air which ascends from plains and valleys. 'The Andes,' says Sir H. Davy, ' placed almost under the line, rise in the midst of burning sands; about the middle height is a pleasant and mild climate; the summits are covered with unchanging snows; and these ranges of temperature are always distinct: the hot winds from below, if they ascend, become cooled in consequence of expansion; and the cold air, if by any force of the blast it is driven downwards, is condensed, and rendered warmer as it descends.'

Evaporation and rarefaction, the grand means employed by nature to temper the excessive heats of the torrid zone, operate very powerfully among mountains and seas. But the level sands are devoured by unmitigated heat. In milder climates, the fervors of the solstitial sun are assuaged by the vapors copiously raised from every river and field, while the wintry cold is moderated by the condensation of atmospheric vapors in the form of snow. The equilibrium of animal temperature is maintained by the copious discharge of vapor from the lungs and the skin. The suppression of this exhalation is a common cause of many formidable diseases. Among these, fever takes the lead. The ardor of the body, in this case of suppressed perspiration, sometimes exceeds the standard of health by six or seven degrees. The direct and natural means of allaying this morbid temperature were first systematically enjoined by Dr. Currie of Liverpool. He showed that the dashing or affusion of cold water on the skin of a fever patient, has most sanatory effects when the heat is steadily about 98°, and when there is no sensation of chillness, and no moisture on the surface. Topical refrigeration is elegantly procured, by applying a piece of muslin or tissue paper to any part of the skin, and moistening it with ether, carburet of sulphur, or alcohol. By pouring a succession of drops of ether on the surface of a thin glass tube containing water, a cylinder of ice may be formed at Midsummer.

The most convenient plan which the chemist can employ, to free a gas from vapor, is to pass It slowly through a long tortuous tube wrapped in porous paper wetted with ether. On the other hand, when he wishes to expose his vessels to a regulated heat, he causes hot vapor to be condensed on their cold surface. The heat, thus disengaged from the vapor, passes into the vessel, and speedily raises it to a temperature which he can adjust with the nicest precision. A vapor bath ought therefore to be provided for every laboratory.

But the most splendid trophy erected to the science of caloric, is the steam-engine of Watt. This illustrious philosopher, from a mistake of his friend Dr. Robison, has been hitherto deprived of a part of his claims to the admiration and gratitude of mankind. The fundamental researches on the constitution of steam, which formed the solid basis of his gigantic superstructure, though they coincided perfectly with Dr. Black's results, were not drawn from them. In some conversations with Dr. Ure, a short period before his death, Mr. Watt described the simple, but decisive experiments, by which he discovered the latent heat of steam. His means and his leisure not then permitting an expensive and complex apparatus, he used apothecaries' phials. With these he ascertained the two main facts, first, that a cubic inch of water would form about a cubic foot of ordinary steam, or 1728 inches; and that the condensation of that quantity of steam would heat six cubic inches of water from the atmospheric temperature to the boiling point. Hence he saw that six times the difference of temperature, or fully 900° of heat, had been employed in giving elasticity to steam; which must be all abstracted before a complete vacuum could be procured under the piston of the steam-engine. These practical determinations he afterwards found to agree pretty nearly with the observations of Dr. Black. Though Mr. Watt was then known to the Dr. he was not on those terms of intimacy with him which he afterwards came to be, nor was he a member of his class.

Mr. Watt's three capital improvements, which seem to have nearly exhausted the resources of science and art, were the following: 1. The separate condensing chest, immersed in a body of cold water, and connected merely by a slender pipe with the great cylinder, in which the impelling piston moved. On opening a valve or stop-cock of communication, the elastic steam, which had floated the ponderous piston, rushed into the distant chest with magical velocity, leaving an almost perfect vacuum in the cylinder, into which the piston was forced by atmospheric pressure. What had appeared impossible to all previous engineers was thus accomplished. A vacuum was formed without cooling the cylinder itself. Thus it remained boiling hot, ready the next instant to receive and maintain the elastic steam. 2. His second grand improvement consisted in closing the cylinder at top, making the piston-rod slide through a stuffing box in the lid, and causing the steam to give the impulsive pressure, instead of the atmosphere. Henceforth the waste of heat was greatly diminished. 3. The final improvement was the double impulse, whereby the power of his engines, which was before so great, was in a moment more than doubled. The counterweight required in the single-stroke engine, to depress the pump-end of the working beam, was now laid aside. He thus freed the machine from a dead weight or drag of many hundred pounds, which had hung upon it from its birth, about seventy years before.

The application of steam to heat apartments is another valuable fruit of these studies. Safety, cleanliness, and comfort, thus combine in giving a genial warmth for every purpose of private accommodation, or public manufacture. It has been ascertained that one cubic foot of boiler will heat about 2000 feet of space in a cotton mill, whose average heat is from 70° to 80° Fahr. And if we allow twenty-five cubic feet of a boiler for a horse's power, in a steam-engine supplied by it, such a boiler would be adequate to the warming of 50,000 cubic feet of space. It has been also ascertained, that one square foot of surface of steam pipe is adequate to the warming of 200 cubic feet of space. This quantity is adapted to a well finished ordinary brick or stone building. The safety valve on the boiler should be loaded with two pounds and a half for an area of a square inch, as is the rule for Mr. Watt's engines. Cast iron pipes are prefe-rable to all others, for the diffusion of heat. Freedom of expansion must be allowed, which in cast iron may be taken at about a tenth of an inch for every ten feet in length. The pipes should be distributed within a few inches of the floor.

Steam is now used extensively for drying muslins and calicoes. Large cylinders are filled with it, which, diffusing in the apartment a temperature of 100° or 130°, rapidly dry the suspended cloth. Occasionally the cloth is made to glide in a serpentine manner closely round a series of steam cylinders, arranged in parallel rows. It is thus safely and thoroughly dried in the course of a minute. Experience has shown that bright dyed yarns like scarlet, dried in a common stove heat of 128°, have their color darkened, and acquire a harsh feel; while similar hanks, laid on a steam pipe heated up to 165° retain the shade and lustre they possessed in the wetted state. The people who work in steam drying-rooms are healthy; those who were formerly employed in the stove-heated apartments became soon sickly and emaciated. These injurious effects must be ascribed to the action of cast iron, at a high temperature, on the atmosphere. The heating by steam of large quantities of water or other liquids, either for baths or manufactures, may be effected in two ways : that is, the steam pipe may be plunged with an open end into the water cistern; or the steam may be diffused around the liquid in the interval between the wooden vessel and an interior metallic case. The second mode is of universal applicability. Since a gallon of water in the form of steam will heat six gallons at 50°, up to the hoiling point, or 162°; one gallon of the former will be adequate to heat eighteen gallons of the latter up to 100°, making a liberal allowance for waste in the conducting pipe. But see our article STEAM.

HEATH, n. s. HEATH'-COCK, n. s. HEATH'-PEASELING, { HEATH'-POUT, n. s. HEATH'-ROSE, n. s. HEATH'Y, adj.

Lat. erica; Teut. and Belgic heide; à Greek $\alpha\iota\theta\omega$, to burn. Minsheu. Heath, an evergreen | shruh of low stature; a J place overgrown with

heath; a place covered with shrubs : heathcock, a fowl that frequents heaths: heath-peaseling, a species of vetch: heath-pout, a bird: heath-rose, a plant.

Say, from whence

You owe this strange intelligence? or why,

Upon this blasted heath you stop our way

With such prophetick greeting? Shakspeare. Some woods of oranges, and heaths of rosemary,

will smell a great way into the sea. Bacon. Cornwall hath quail, rail, partridge, pheasant, Carew's Survey. heath-cock, and powte.

Health and long life have been found rather on the peak of Derbyshire, and the heaths of Staffordshire, than fertile soils. Temple.

Not heath-pout, or the rarer bird

Which Phasis or Ionia yields,

Mere pleasing morsels would afford

Than the fat olives of my fields. Dryden. In Kent they cut up the heath in May, burn it, and

spread the ashes. Mortimer's Husbandry. This sort of land they order the same way with the heathy land. H.

Oft with bolder wing they soaring dare The purple heath.

Thomson.

• Неати (Benjamin), L.L.D., an eminent lawyer, town clerk of Exeter, and author of several learned works, was educated at Oxford, where he took his degree in civil law, 31st of March 1762. He wrote, 1. An Essay towards a demonstrative Proof of the Divine Existence, Unity, and Attributes; to which is premised, A short Defence of the Argument commonly called à priori, 1740. 2. Notæ sive Lectiones, ad opera Tragicorum Græcorum veterum, Æschyli, &c. 1752, 4to., a work which places the author's learning and critical skill in a very conspicuous light. 3. The Case of the County of Devon with respect to the Consequences of the New Excise Duty on Cyder and Perry. Published by the direction of a Committee appointed at a General Meeting of that County to superintend the Application for the Repeal of that Duty, 1763, 4to. 4. A Revisal of Shakspeare's Text, wherein the alterations introduced into it by the more modern editors and critics are particularly considered := 8vo. 1765.

HEATH (James), an English historian, born in 1629 at London; where his father, who was the king's cutler, lived. He was educated at Westminster school, and became a student of Christ Church, Oxford, in 1646. In 1648 he was ejected by the parliamentary visitors for his adherence to the royal cause; and then marrying, was obliged to write books and correct the press to maintain his family. He died of a consumption and dropsy at London in August 1664, and left several children. His chief works were, 1. A brief Chronicle of the late Intestine War in the three kingdoms of England, Scotland, and Ireland, &c., 1661, 8vo.; afterwards enlarged, and completed from 1637 to 1663, in 4 parts, 1663, in 8vo. To this was again added a continuation from 1663 to 1675, by John Philips,

nephew to Milton, 1676, folio. 2. Flagellum : or The Life and Death, Birth and Burial, of Oliver Cromwell, 1663. The third edition came out with additions in 1665, 8vo. 3. A New Book of Loyal English Martyrs and Confessors, who have endured the Pains and Terrors of Death, Arraignment, &c., for the Maintenance of the just and legal Government of these Kingdoms both in Church and State, 1663, 12mo. Heath, who perhaps had nothing but pamphlets and newspapers to compile from, frequently relates facts that throw light upon the history of those times, which Clarendon, though he drew every thing from the most authentic records, has omitted.

HEATHCOTE (Ralph), D. D., a learned English divine of considerable abilities, born in 1721. He was educated and graduated at Cambridge. He wrote, 1. A Treatise against the Hutchinsonians; 2. A Sketch of Lord Bolingbroke's Philosophy; 3. Sylva, or the Wood: and several other pieces.

HEA'THENISHLY, adv.

d several outer process adj. Teut. megaca., HEATHEN, n. s. & adj. Swed. and Dan. $\int_{εθνικος}^{heden;}$ of Greek εθνικος, εθνος. The

Deliver us from the heathen, that we may give thanks to thy holy name. 1 Chron. xvi. 35.

Under an hethen castel at the last,

(Of which the name in my text I not find)

Custance and eke her child the see up cast.

Almighty God, that saved all mankind,

Have on Custance and on hire child some mind,

That falleu is in hethen hond eftsone

In point to spill, as I shall tell you sone

Chaucer. The Man of Lawes Tale. The Moors did tread under their heathenish feet whatever little they found yet there standing.

Spenser. When the apostles of our Lord and Saviour were ordained to alter the laws of heathenish religion, chosen they were, St. Paul excepted; the rest unschooled altogether, and unlettered men. Hooker.

If the opinions of others whom we think well of, be a ground of assent, men have reason to be heathens in Japan, Mahometans in Turkey, papists in Spain, and pretestants in England. Locke.

In a paper of morality, I consider how I may re-commend the particular virtues I treat of, by the precepts or examples of the ancient heathens.

Addison.

That exectable Cromwell made a heathenish or rather inhuman edict against the episcopal elergy, that they should neither preach, pray in publick, baptize, marry, bury, nor teach schools. South.

HEATHENS. See Mysteries, Mythology, and POLYTHEISM.

HEATHFIELD, Lord. See ELIOTT.

HEATH-PEAS. See OROBUS.

HEATOTOTL, in ornithology, the name of an American bird, described by Nieremberg, and called also avis venti. It is remarkable for a very large and round crest of whitish feathers on its head. Its breast is of a brownish-gray; its belly white, and its feet yellow; its tail is round when expanded, and is variegated with black and white; its back and wings are black.

HEAVE, v. a., v. n., & n. s. Pret. heaved, HEAVE, v. a., v. n., & n. s. Anciently hove; part. heaved, or hoven; Sax. heavian; Ger. heben, from the absolute particle ha, signifying high, which is the radical meaning of the word; and thus to heave is to lift, carry, raise, cause to swell, to force up from the breast, to exalt, to puff or elate, to pant, to labor, to keck, to feel a tendency to vomit; heave, an exertion, lift, struggle, &c.; heave-offering, an offering amongst the Jews.

Ye shall offer a cake of the first of your dough for an heave-offering, as ye do the heave-offering of the threshing floor. Numbers.

There has no dore, that he nolde *heve* of barre Or breke it at a renning with his hede

Chaucer. Prologue to Canterbury Tales. So daunted, when the giant saw the knight,

His heavy hand he heaved up on high,

And him to dust thought to have battered quite. Spenser.

Now we bear the king

Tow'rd Calais: grant him there; and there being seen,

Heave him away upon your winged thoughts Athwart the sea. Shakspeare.

I cannot heave My heart into my mouth. Id.

There's matter in these sighs; these profound heaves

You must translate; 'tis fit we understand them. Id.

Made she no verbal quest?

Yes, once or twice she heaved the name of father Pantingly forth, as if it prest her heart. Id.

The wretched animal *heaved* forth such groans^{*}; That their discharge did stretch his leathern coat Almost to bursting. *Id. As You Like It.* 'Tis such as you,

That creep like shadows by him, and do sigh At each his needless *heavings*; such as you Nourish the cause of his awaking. Id.

Poor shadow-painted queen !

One heaved on high, to he hurled down below. Id.

The Scots, heaved up into high hope of victory, took the English for foolish birds fallen into their net, forsook their hill, and marched into the plain.

Hayward.

So stretched out huge in length the arch fiend lay,

Chained on the burning lake; nor ever thence Had risen, or *heaved* his head, but that the will And high permission of all-ruling heaven Left him at large, Milton.

But, after nany strains and heaves, He got up to his saddle eaves. Hudibras.

Thou hast made my curdled blood run back, My heart heave up, my hair to rise in bristles.

Dryden.

The wand'ring breath was on the wing to part; Weak was the pulse, and hardly heaved the heart. Id.

The holy priests gaze on her when she smiles. And with *heaved* hands, forgetting gravity,

They bless her wanton eyes. Id. None could guess whether the next heave of the

earthquake would settle them on the first foundation, or swallow them. *Id.* The groans of ghosts that cleave the earth with

pain,

And heave it up : they pant and stick half way.

HEA

He died in fight;

Fought next my person, as in consort fought,

Save when he heaved his shield in my defence,

And on his naked side received my wound. Id.

He heaves for breath, which, from his lungs supplied,

And fetched from far, distends his lab'ring side. Id.

No object affects my imagination so much as the sea or ocean: I cannot see the *heaving* of this prodigious bulk of waters, even in a calm, without a very pleasing astonishment. Addison.

Why dost thou frówn upon me? My blood runs cold, my heart forgets to heave,

And life itself goes out at thy displeasure.

Id. Cato.

Frequent for breath his panting bosom heaves. Prior. The heaving tide

> In widened circles beats on either side. Gay. The glittering finny swarms,

That heave our friths and crowd upon our shores. Thomson.

The church of England had struggled and heaved at a reformation ever since Wickliff's days.

Atterbury.

And souls immortal must for ever *heave* At something great; the glitter, or the gold, The praise of mortals, or the praise of Heaven.

Young.

Awaking with a start

The waters *heave* around me, and on high The winds lift up their voices.

Byron. Childe Harold.

Thou glorious mirror, where the Almighty's form Glasses itself in tempests; in all time,

Calm or convulsed-in breeze, or gale, or storm,

Icing the pole, or in the torrid clime

Dark *heaving*, houndless, endless, and sublime-The image of Eternity. Id.

HEAV'EN, n. s. HEAV'ENLY, adj. & adv. HEAV'EN-WARD, adv. HEAV'EN-BEGOT, adj. HEAV'EN-BORN, adj. HEAV'EN-BRED, adj. HEAV'EN-DIRECTED.

Sax. beoron, which seems to be derived from beoro, the places over head. See HEAVE. I leaven is a word especially connected with Christianity; the residence

of the Almighty; in all its derivations properly applied only to moral and spiritual subjects; whilst celestial, as derived from *calum*, is descriptive of the visible firmament, and applicable to many subjects illustrated in the heathen mythology, where heavenly would be evidently improper: it has, however, been used by authors without this distinction to denote the sky, the pagan gods, or whatever is high and exalted: the compounds are sufficiently obvious in their meanings.

Certes heven is yeven to hem that will labour, and not to idel folk. Chaucer. The Persones Talc.

Is called a long perilous viage.

Id. Dreamc.

Such were the goddesses which ye did see : But that fourth mayed, which there amidst them traced,

Who can aread what creature more she be;

Whether a creature, or a goddesse graced

With heavenly gifts from heaven first enraced.

Spenser. Facric Queenc.

That summons thee to <i>neaven</i> , or to he	
Shakspeare.	Macbeth.
O, for a muse of fire, that would as	cend
The brightest heaven of invention. Sh	akspeare.
Much is the force of heaven-bred poesy	. Id.
A station like the herald Mercury,	
New lighted on a heaven-kissing hill.	Id.
Now heaven help him !	Id.
Take physick, pomp;	
Expose thyself to feel what wretches f	
That thou may'st shake the superflux t	o them,
And show the heavens more just.	Id.

They can judge as fitly of his worth, As I can of those mysteries which heaven Will not have earth to know. Id.

The words are taken more properly for the air and ether than for the heavens. Raleigh's History.

Thus they in heaven, above the starry sphere, Their happy hours in joy and hymning spent.

Milton. The will

And high permission of all-ruling heaven Id. Left him at large.

Truth and peace and love shall ever shine About the supreme throne

Of him, t'whose happy-making sight alone,

Our heavenly guided soul shall climb. These, the late Id.

Heaven-banished host, left desert utmost hell. Id. All yet left of that revolted rout,

Heuren fallen, in station stood, or just array, Id. Sublime with expectation.

Who would such men hcaven's messengers believe, Who from the sacred pulpit dare deceive ? Marvell.

As the love of heaven makes one heavenly, the love of virtue virtuous, so doth the love of the world Sidney. make one become worldly.

The prophets were taught to know the will of God, and thereby instruct the people, and enabled to prophesy, as a testimony of their heing sent by heaven.

Temple. Some fires may fall from heaven.

Priesthood, that makes a merchandise of heaven ! Priesthood, that sells even to their prayers and blessings.

Id.

And force us to pay for our own cos'nage ! Dryden.

Thy race in time to come

Shall spread the conquests of imperial Rome ; Rome, whose ascending towers shall heaven invade, Involving earth and ocean in her shade. Id.

Heavens ! what a spring was in his arm, to throw ! How high he held his shield, and rose at every blow.

	Id.	
If I am <i>heaven-begot</i> , assert your son		
By some sure sign.	Id.	
Adoring first the genius of the place,		
hen earth the mother of the heavenly race	Id.	1

If once a fever fires his sulphurous blood,

In every fit he feels the hand of God,

Id. Juvenal. And heaven-born flame. This act, with shouts heaven high, the friendly band

Applaud.

Not Maro's muse, who sung the mighty man;

Nor Pindar's heavenly lyre, nor Horace when a swan.

TAMERLANE. The world !- 'twould be too little for thy pride!

Thou would'st seale heaven.

BAJAZET. I would :- Away ! my soul

Rowe's Tamerlane. Disdains thy conference.

HEA

I prostrate lay,

By various doubts impelled, or to obey, Or to object; at length, my mournful look, Heavenward erect, determined, thus I spoke. Prior. Last night (I vow to Heaven 'tis true)

Bounce from the fire a coffin flew. O sacred weapon ; left for truth's defence ;

To all but heaven-directed hands denied : The muse may give it, but the gods must guide. Pope.

His arms had wrought the destined fall Of sacred Troy, and razed her heaven-built wall.

Id. Oh ! heaven-born sisters ! source of art ! Who charm the sense, or mend the heart; Who led fair Virtue's train along, Moral truth, and mystick song! Id.

Who taught that heaven-directed spire to rise ? Id. In these deep solitudes and awful cells, Where heavenly pensive Contemplation dwells,

And ever-musing Melancholy reigns,

What means this tumult in a vestal's veins? Id. Heaven gives us friends to bless the present scene ;

Resumes them, to prepare us for the next. Young.

When Juno's charms the prize of beauty claim, Shall aught in earth, shall aught in heaven contend? Beattie.

All heaven and earth are still-though not in sleep, But breathless, as we grow when feeling most ; And silent, as we stand in thoughts too deep :-All heaven and earth are still : From the high host Of stars, to the lulled lake and mountain-coast, All is concentered in a life intense.

Byron. Childe Harold.

Gay.

HEAVEN, among Christian divines and philosophers, is considered as a place in which the omnipresent Deity affords a nearer and more immediate view of himself, and a more sensible manifestation of his glory, than in the other parts of the universe. This is often called the empyrean heaven, from that splendor with which it is supposed to be invested; and of this place the inspired writers give us the most noble and magnificent descriptions.

HEAVEN, among Pagans, was considered as the residence only of the celestial gods, into which no mortals were admitted after death, unless they were deified. As for the souls of good men, they were consigned to the Elysian fields. See ELYSIUM.

HEAVEN, in astronomy, called also the æthereal and starry heaven, is that immense region wherein the stars, planets, and comets, are disposed. See ASTRONOMY. This is what Moses calls the firmament, speaking of it as the work of the second day's creation; at least it is thus the word רקיע is usually rendered by his interpreters, though somewhat improperly, arising from the ancient notion of the heavens being firm or solid. But the word properly signifies no more than expanse or extension; a term very well adapted by the sacred historian to the impression which the heavens make on our senses; whence, in other parts of Scripture, the heaven is compared to a curtain, or a tent stretched out to dwell in. The LXX first added to this idea of expansion that of firm or solid; rendering it by $\pi\epsilon\rho\epsilon\omega\mu a$, according to the philosophy of those times; in which they have been very injudiciously followed by the modern translators. Des Cartes,

199

Kircher, &c., demonstrated this heaven not to be solid but fluid; but they still supposed it full, or perfectly dense, without any vacuity, and cantoned out into many vortices. But others have overturned, not only the solidity, but the supposed plenitude of the heavens. Sir Isaac Newton has abundantly shown the heavens void of almost all resistance, and, consequently, of al-most all matter: this he proves from the phe-nomena of the celestial bodies; from the planets persisting in their motions without any sensible diminution of their velocity; and the comets freely passing in all directions towards all parts of the heavens. Heaven, taken in a general sense, for the whole expanse between our earth and the remotest regions of the fixed stars, may be divided into two very unequal parts, according to the matter found therein; viz. the atmosphere, or aerial heaven, possessed by air; and the æthereal heaven, possessed by a thin, unresisting medium, called æther. Heaven is also used, in astronomy, for an orb, or circular region, of the æthereal heaven. The ancient astronomers supposed as many different heavens as they observed motions therein. These they supposed all to be solid, as thinking they could not otherwise sustain the bodies fixed in them; and spherical, that being the most proper form for motion. Thus they had seven heavens for the seven planets; viz. the heavens of the Moon, Mercury, Venus, the Sun, Mars, Jupiter, and Saturn. The eighth was for the fixed stars, which they called the firmament. Ptolemy adds a ninth heaven, which he called the primum mobile. Two crystalline heavens were added by king Alphonsus X., &c., to account for some irregularities in the motions of the other heavens: and, lastly, an empyrean heaven was drawn over the whole, for the residence of the Deity; which made the number twelve. But others admitted many more heavens, according as their different views and hypotheses required. Eudoxus supposed twenty-three, Callippus thirty, Regiomontanus thirty-three, Aristotle forty-seven, and Fra-castor no less than seventy. The astronomers, however, did not much concern themselves whether the heavens they thus allowed of were real or not; provided they served a purpose in accounting for any of the celestial motions, and agreed with the phenomena.

HEAV'ILY, adv. HEAV'INESS, n. s. HEAV'INESS, n. s. HEAV'INESS, n. s. Weight, and is opposed to whatever is light, airy, cheerful; as depressed; dull; drowsy; oppressive; burdensome; sluggish; indigestible; rich in soil when applied to lands; heavy, adverb for heavily.

Heaviness in the heart of man maketh it stoop ; but a good word maketh it glad. Prov. xii. 25.

Ye greatly rejoice ; though now for a season ye are in heaviness, through manifold temptations.

1 Pet. i. 6.

Menelaus bore an heavy hand over the citizens, having a malicious mind. 2 Mac. v. 23.

Nature, the vicaire of the almightie Lorde, That hote and colde ; hevie, light ; moiste, and drie, Hath knit, by even number of accorde,-In csie voice, began to speke and saie.

Chaucer. The Assemblec of Foules.

And every comfort possible in this cas They don to hire, with all hir besinesse, Al for to make hire leve hire hevinesse. Id. The Frankeleines Tals. -Doughter, stint thin hevinesse. Among the goddes highe it is affermed, And by etcrne word written and confermed, Thou shalt be wedded unto on of tho, That han for thee so mochel care and wo; But unto which of hem I may not tell. Id. The Knightes Tale.

We are, at the hearing of some, more inclined unto sorrow and heaviness; of some more mollified and softened in mind. Hooker.

I would not be accounted so hase minded, or heavy headed, that I will confess that any of them is for valour, power, or fortune, hetter than myself.

Knolles.

Let not your ears despise my tongue for ever. Which shall possess them with the heaviest sound That ever yet they heard. Shakspeare. Maebeth.

If the cause be not good, the kiug himself hath a heavy reckoning to make. Id. Henry V.

Pray for this good man, and for his issue,

Whose heavy hand hath bowed you to the grave, And beggared yours for ever. Shakspeare. Our strength is all gone into heaviness,

That makes the weight. Id. But let thy spiders that suck up thy venom,

And heavy gaited toads lie in their way. Id. I came hither to transport the tydings,

Which I have heavily borne. Id.

Against ill chances men are ever merry ; But heaviness foreruns the good event. Id.

Let us not burthen our remembrance with An heaviness that's gone. Id.

Why looks your grace so heavily to-day? -O, I have past a miserable night. Id.

This heavy headed revel, East and West, Make us traduced, and taxed of other nations. Id. Hearing that there were forces coming against him, and not willing that they should find his men heary and laden with booty, he returned unto Scotland.

Bacon's Henry VII.

The subject is concerning the heaviness of several bodies, or the proportion that is required betwixt any weight and the power which may move it. Wilkins.

Mersennus tells us, that a little child, with an cngine of an hundred double pulleys, might move this earth, though it were much heavier than it is. Id.

Fair, tall, his limbs with due proportion joined ; But of a heavy, dull, degenerate mind. Dryden.

He would not violate that sweet recess,

And found besides a welcome heaviness,

Which seized his eyes. Id. I put into thy hands what has been the diversion of

some of my idle and heavy hours. Locke.

What means this heaviness that hangs upon me? This lethargy that creeps through all my senses ? Addison.

My heavy eyes, you say, confess A heart to love and grief inclined.

Prior. Ease must be impracticable to the envious : they lio under a double misfortune; common calamities and common blessings fall heavily upon them. Collier.

A sensation of drousiness, oppression, heaviness, and lassitude, are signs of a too plentiful meal.

Arbuthnut.

As Alexandria exported many commodities, so it received some, which, by reason of the fatness and heaviness of the ground, Egypt did not produce; such as metals, wood, and pitch. Id.

Such preparations as retain the oil or fat, are most heavy to the stomach, which makes baked meat hard of digestion.

Chartres, at the levee,

Tells with a sneer the tyding heavy. Swift. A work was to be done, a heavy writer to be encouraged, and accordingly many thousand copies were bespoke. Id.

When alone, your time will not be heavy upon your hands for want of some trifling amusement. Id.

But, hark !--- that heavy sound breaks in once more, As if the clouds its echo would repeat ;

And nearer, nearer, deadlier than before!

Arm ! arm ! it is-it is-the cannon's opening roar.

Byron. Childe Harold.

HEB'DOMAD, n.s. Lat. hebuomas. space of seven days;

As for hebdomadal periods, or weeks, in regard of their sabbaths, they were observed by the Hebrews.

Browne.

124

Computing by the medical month, the first hebdomad, or septenary, consists of six days, seventeen hours and a half. Id.

HEBDOMADARY, HEBDOMADARIUS, OF HEB-DOMADIUS, from Gr. ¿βδομας, seven; a member of a chapter or convent, whose week it is to officiate in the choir, to rehearse the anthems and prayers, and to perform the usual functions which the superiors perform at solemn feasts, and other extraordinary occasions. He generally collates to the benefices which become vacant during his week. In cathedrals, the hebdomadary was a canon or prebendary, who had the peculiar care of the choir, and the inspection of the officers for his week. In monasteries, he waits at table for a week, or other stated period; directs and assists the cook, &c.

HEBDOMAGENES, from $i\pi\tau a$, seven, and $\gamma \epsilon \nu \nu \eta \sigma \iota c$, birth, a title of Apollo, so named from his being born on the seventh day of the month; whence the seventh days were held sacred to him. See HEBDOME.

HEBDOME, Gr. $i\beta\delta o\mu a\varsigma$, the seventh day, a solemnity of the ancient Greeks, in honor of Apollo, in which the Athenians sung hymns to his praise, and carried in their hands branches of aurel. It was observed on the seventh day of every lunar month.

HEBE, in ancient mythology, a goddess, the idea of whom, among the Romans, seems to have been that of eternal youth, or immortality of bliss. She is fabled to have been a daughter of Jupiter and Juno. According to some, she was the daughter of Juno only, who conceived her after eating lettuces. She was fair, and always in the bloom of youth, being the goddess of youth, and made by her mother cup-bearer to the gods. She was dismissed from her office by Jupiter, because she fell down in an indecent posture as she was pouring nectar to the gods at a grand festival; and Ganymede, his favorite, appointed cup-bearer in her place. She was employed by Juno to prepare her chariot, and to harness her peacocks. When Hercules was raised to the rank of a demi-god, he was reconciled to Juno by marrying Hebe, by whom he had two sons, Alexiares and Anicetus. As Hebe had the power of restoring gods and men to the vigor of youth, she, at the request of her husband, performed that kind office to his friend Iolaus. She was worshipped at Sicyon, under

a

the name of Dia, and at Rome, under that of Juventas.

HEBENSTREIT (John Ernest), M. D., a learned physician, born at Leipsic in 1702. He wrote Carmen de usu Partium, and several other works; and died in 1756, aged fifty-four. His brother, John Christian Hebenstreit, was an eminent Hebraist.

HEBÉNSTRETIA, in botany, a genus of the angiospermia order, and didynamia class of plants; natural order forty-eighth, aggregatæ: CAL. emarginated, and divided below : COR. unilabiate; the lip rising upwards, and quadrifid : CAPS. dispermous; the stamina inserted into the margin of the limb of the corolla. Species eight, all natives of the Cape of Good Hope. The two best known in this country are H. dentata, having a striped white flower, and H. aurea, goldenflowered hebenstretia, with a rich yellow flower, peculiarly fragrant in an evening.

HEBER, the son of Salah, great-grand-son of Shem, and father of Peleg, from whom according, to Josephus, Eusebius, Jerome, Bede, and most of the interpreters of the sacred writings, the Hebrews derived their name, but Huet has attempted to prove that the Hebrews took their name from the word Heber, which signifies beyond, because they came from beyond the Euphrates. Heber lived 464 years, and is supposed to have been born A.A.C. 2281.

HEBERDEN (William), a learned physician, was born in London in the year 1710. Having received his early education in his native city, he was entered of St. John's College, Cambridge, in 1724; and, after a residence of six years, he was elected a fellow. From this time he devoted himself to the study of medicine, partly at Cambridge, and partly in the metropolis. After he had taken the degree of M. D. he settled at Cambridge, where he practised his profession during ten years, and gave lectures on the materia medica annually to the students in the university. While he resided here, we believe, he printed a little tract, entitled Avrionpiaka; An Essay on Mithridatium and Theriaca, 1745. This tract contained a history of these medicaments, and an exposure of the absurdity of employing such a medley of discordant simples. In 1748 Dr. Heberden removed to London, to the general regret of the university and town of Cambridge, where his professional skill and suavity of manners had obtained for him a high esteem. He had already been elected a fellow of the College of Physicians, and was shortly after admitted into the Royal Society. He'soon rose to a considerable professional reputation, and enjoyed a large share of medical practice in the metropolis. To Dr. Heberden's suggestion the public is indebted for the publication of the Medical Transactions of the College of Physicians, the first volume of which appeared in 1768, and two others subsequently, in 1772 and 1785. Among the useful communications con-tained in these volumes, the papers of Dr. Heberden himself are most prominent in number and value. His account of a fatal disorder o. the chest, which he denominated angina pectoris, first called the attention of physicians to it, as an idiopathic disease; and the numerous cases of it

which have since been promulgated, evince its frequency and importance. Dr. Heberden communicated some other papers to the Royal Society, which were printed in its Transactions. For several years he enjoyed the rewards of a virtuous and temperate life in a healthy and peaceful old age, cheered by domestic enjoyments, and scientific and literary pursuits. Ife died calmly in 1801, after completing the ninetieth year of his age, and was buried in the parish church of Windsor.

IIEBERT (James Rene), a chief of one of the revolutionary factions of France, was born at Alençon, in the department of the Orne, about 1755; and supported himself, previously to the revolution, as a cheque-taker at the theatre des Variétés. He was dismissed, it is said, for dishonesty; after which he lived with a physician, whom he robbed. In 1789 he commenced political demagogue, and attracted notice by a journal entitled Le Père Duchesne, which abused the court and the monarchy. On the 10th of August, 1792, he became one of the members of the municipality of Paris; and was soon after nominated deputy of the national agent of the commune: it was then that, connecting himself intimately with Chaumette and Pache, he employed all his influence in forwarding a project to establish the authority of the commune on the ruins of the national representation. The Hebertists now rejected the advances of the Orleans party, and separated from the Cordeliers, of whom they had hitherto formed a part. The Girondists, who were at that period contending against the Mountain party, had credit enough to procure the arrest of Hebert, May 24th, 1793. He was defended by Murat in the convention; the deputies of all the sections spoke in his favor at the bar on the 25th; and, on the 27th, after a tempestuous session, he was again restored to liberty. Prompted by revenge, he now assisted with all his power in the proscription of the Brissotins. Their downfall hastened his own. Danton and Rohespierre suspended their mutual jealousies to accomplish his destruction; and Hebert, with the greater part of his associates, was arrested, and condemned to death, March 24th, 1794. Besides his journal, he was the author of other political pieces of a similar description: he was the author of some of the basest calumnies on the unfortunate queen of France.

HEB'ETATE, v.a. HEBETA'TION, n. s. HEB'ETUDE, n. s. To dull; to blunt, or HEB'ETUDE, n. s.

The pestilent seminarics, according to their grossness or subtility, activity or hebetude, cause more or less truculent plagues. Harvey.

The cyc, especially if *hebetated*, might cause the same perception. Id.

Beef may confer a robustness on the limbs of my son, but will *hebetate* and clog his intellectuals. *Arbuthnot and Pope*.

HE'BRAISM, n. s. HE'BRAIST, n. s. HEBRIC'IAN, n. s. tions of persons skilled in the Hebrew language.

The words are more properly taken for the air or ether than the heavens, as the best *Hebricians* understand them. Raleigh.

The nature of the Hebrew verse, as the meanest *Hebrician* knoweth, consists of uneven feet.

Peacham.

Milton has infused a great many Latinisms, as well as Græcisms, and sometimes *Hebraisms*, into his poem. Spectator.

HEBREW BIBLE. See BIBLE.

HEBREW CHARACTERS. There are two kinds of Hebrew characters; the ancient or square, and the modern or Rabbinical characters.

HEBREW CHARACTER, ANCIENT, or the SQUARE HEBREW, takes this last denomination from the figure of its characters, which stand more square, and have their angles more exact than the other. This character is used in the text of Holy Scripture, and the principal and most important writings of the Jews. When both this and the rabbinical character are used, in the same work, the former is for the text, or the fundamental part; and the latter for the accessory part, as the gloss, notes, commentaries, &c. The best and most beautiful characters of this kind are those copied from the characters in the Spanish MSS.; next, those from the Italian MSS.; then those from the French; and, lastly, those of the Germans, whose characters are much the same, with respect to the other genuine square Hebrew characters, that the Gothic or Dutch characters are with respect to the Roman. Several authors contend that the square character is not the real ancient Hebrew character, written from the beginning of the language to the time of the Babylonish captivity; but that it is the Assyrian, or Chaldee character, which the Jews assumed, and accustomed themselves to, during the captivity, and retained afterwards. They say that the Jews, during their captivity, had quite disused their ancient character; so that Ezra found it necessary to have the sacred books transcribed into the Chaldean square character. These authors add, that what we call the Samaritan character, is the genuine ancient Hebrew. Of this opinion are Scaliger, Bochart, Casaubon, Vossius, Grotius, Walton, Capellus, &c., and, among the ancients, Jerome and Eusebius. On this side it is urged, that the present characters are called Assyrian by the ancient Jewish writers of the Talmud, and therefore must have been brought from Assyria; but to this argument it is replied, that there were two sorts of characters anciently in use, viz. the sacred or present square character, and the profane or civil, which we call Samaritan; and that the sacred is called Assyrian, because it first began in Assyria to come into common use. It is farther alleged, that the Chaldee letters, which the Jews now use, were unknown to the ancient Jews before the captivity, from Dan. i. 4. It is also inferred from 2 Kings xvii. 28, where it is said that a Jewish priest was sent to teach the Samaritans the worship of Jehovah; on which occasion he must have taught them the law; and yet no mention is made of his teaching them the language or character, that the law was then written in, the character which the Samaritans used. But the chief argument is taken from some ancient Jew-

ish shekels, with a legend on one side, The shekel of Israel, and on the other Jerusalem, the holy, both in Samaritan characters. These shekels, it is said, must have been coined before the division of the two kingdoms of Judah and Israel, or at least before the Assyrian captivity, because the Samaritans never afterwards reckoned Jerusalem holy. On the other side, or for the primitive antiquity of the square character, are the two Buxtorfs, Leusden, Calovius, Ilottinger, Spanheim, Lightfoot, &c. They urge, from Matthew v. 18, that jod is really the least of the consonants in the present Hebrew, whereas it is one of the largest characters in the Samaritan alphabet: but Walton replies, that, if our Saviour here speaks of the least letter of the alphabet, we can only infer, that the Chaldee character was used in our Saviour's time, which is not denied by those who maintain the Samaritan to be the original. They also allege, that the Jews were too obstinate and superstitious to allow their sacred character to be altered; but, if this was done under the direction and authority of Ezra, the argument will be much invalidated. Farther, they say that Ezra could not alter the ancient character, because it was impossible to make the alterations in all their copies. This argument, however, is contradicted by facts; since the old English black letter is actually changed for the Roman. They say, likewise, that Ezra was not disposed to profane the sacred writings with a heathen character; but this supposes that Ezra was so superstitious as to imagine that there was some peculiar sanctity in the shape of the letters. Moreover, the advocates for this opinion appeal to ancient coins found in Judea, with a legend in the Chaldee or Assyrian character. But the genuineness of these coins is suspected. The learned Jesuit Souciet maintains, with great address, that the ancient Hebrew character is that found on the medals of Simon, and others, commonly called Samaritan medals; but which, he asserts, were really Hebrew medals, struck by the Jews, and not the Buxtorf endeavours to reconcile Samaritans. these two opinions, by producing a variety of passages, from the rabbies, to prove that both these characters were anciently used ; the present square character being that in which the tables of the law, and the copy deposited in the ark, were written; and the other character being used in the copies of the law which were written for private and common use, and in civil affairs in general; and that, after the captivity, Ezra enjoined the former to be used by the Jews on all occasions, leaving the latter to the Samaritans and apostates. But it can hardly be allowed by any who consider the difference between the Chaldee and Samaritan characters, with respect to convenience and beauty, that they were ever used at the same time. After all, it is of no great moment which of these, or whether either of them, were the original characters; since it appears, that no change of the words has arisen from the manner of writing them, because the Samaritan and Jewish Pentateuch almost always agree after so many ages. It is most probable that the form of these characters has varied in different periods; this appears from the testi-mony of Montfauçon, in his Hexapla Origenis, vol. i. p. 22, &c., and is implied in Dr. Kenni- vaulted stories.

cot's making the characters in which MSS. are written one test of their age.

HEBREW CHARACTER, MODERN, or the rabbinical Hebrew, is a good neat character, formed of the square Hebrew, by rounding it, and retrenching most of the angles or corners of the letters, to make it the more easy and flowing. The letters used by the Germans are very different from the rabbinical characters used every where else, though all formed alike from the square character, but the German in a more slovenly manner than the rest. The rabbies frequently make use either of their own, or the square Hebrew character, to write the modern languages in. There are even books in the vulgar tongues printed in Hebrew characters; instances whereof are seen in the late French king's library. See Plate ALPHABET.

HEBREW LANGUAGE, RABBINICAL, or the modern Hebrew, is the language used by the rabbies in their writings. The basis or body hereof is the Hebrew and Chaldee, with divers alterations in the words of these two languages, the meanings of which they have considerably enlarged and extended. Abundance of phrases they have borrowed from the Arabic : the rest is chiefly composed of words and expressions from the Greek; some from the Latin; and others from the other modern tongues; particularly that spoken in the place where each rabbi lived or wrote. The rabbinical Hebrew must be allowed to be a very copious language. M. Simon, in his Hist. Crit. du Vieux Testam. liv. iii. ch. 27, observes, that there is scarcely any art or science but the rabbies have treated thereof in it. They have translated most of the ancient philosophers, mathematicians, astronomers, and physicians; and have written themselves on most subjects ; they do not want even orators and poets.

HEBREWS, OF EPISTLE TO THE HEBREWS, a canonical book of the New Testament. Though St. I'aul did not affix his name to this epistle, the concurrent testimony of the best authors ancient and modern afford such evidence of his being the author of it, that the objections to the contrary are of little or no weight. The Hebrews, to whom this epistle was written, were the believing Jews of Palestine; and its design was to convince them, and by their means all the Jewish converts wheresoever dispersed, of the insufficiency and abolition of the ceremonial and ritual law.

HEBRIDES, ÆBUDÆ, or Western Islands, the general name of two archipelagos of islands, lying to the north-west of Scotland, and situated between 55° and 59° N. lat.: they are supposed to be about 300 in number, and to contain 50,000 inhabitants. Not above thirty of them, however, are of any consequence We shall commence our notice with those nearest the main, going from south to north.

Elsa or Ailsa is a perpendicular rock of great height two miles in circuit, with only one landing place at a little beach on the north-east. It pastures some goats, abounds in rabbits, and is the resort of Soland geese, whose young and feathers, as well as the rabbit skins, pay the £33, at which it is rented from the earl of Cassilis. On the north-east side is a square tower of three vaulted stories. Ghia, two miles from the west coast of Kintyre, is six miles long and one broad, with 500 inhabitants; it produces barley, oats, and flax, and in 1772 afforded a rent of $\pounds 600$.

Cara, south of Ghia, is three miles in circuit, and inhabited by a single family.

Ilay, one of the most fertile of the islands, is twenty-eight miles long and sixteeen broad. On the north it forms the deep Loch Indal, a good harbour; it contains mines of lead and other minerals, and has several lakes. The population is 7000, and in 1772 it afforded a rent of £2300. Bowmore, the chief place, is on Loch Indal, and is a good village with a fair and market.

Jura is separated from IIa by IIa Sound, one mile broad. The island is ten leagues long and one or two broad, forming two peninsulas; it is one of the most rocky and rugged of the Hebrides, rising near the south end in several conical summits, called the Paps of Jura, the highest of which, named Ben-an-oir, or the Golden Mountain, has 3000 feet elevation. Red deer are still found in the mountains, and abundance of grouse and moor game. There are two good harbours on the east side, but the whole business of the island employs only a few open boats. The population is 1200.

Colonsay, a rocky island three leagues long and two broad, has 500 inhabitants. Oransay is separated from Colonsay by a channel dry at low water; it is three miles long, and the population is 300. These islands have great numbers of rabbits, but no hares.

Scarba is separated from Jura by the strait of Corryvreken, noted for its whirlpool. The island is three miles long, very rugged, and mountainous.

Long Island and Baluanaigh are small islands, composed entirely of slate. Suyl is separated from the main land of Argyle by a channel so narrow, that a bridge of a single arch has been thrown across it.

Easdale is an entire rock of slate, from which 5,000,000 of slates are exported to England, Norway, and Canada.

Kerrera, a mile from the main land of Lorn, is four miles long and two broad; it has two good harbours.

Mull is separated from the peninsula of Morvern, in Argyle, by a strait one mile and a half broad. It is eight leagues long and five broad; rugged and mountainous, but with good pasture and some corn land; it has 6000 inhabitants, and is the joint property of the duke of Argyle and the M'Leans. Tobermoray, the chief place, is a village on the north-east with a good haven, where a fishing station has been founded.

Uba is a small island in Loch Tua, on the west of Mull, the property of the family of M'Quarrie. Inch Kenneth, in the same loch, is a little fertile island, with the vestiges of a chapel.

Icolumkill, Iona or Hii, one of the most fertile and romantic of the Scottish islands, is two miles and a half long and one broad, with 150 inhabitants in two or three hamlets, who export some cattle and grain; it is the property of the duke of Argyle, and is celebrated for having afforded an asylum to St. Columba and other holy men, after the introduction of Christianity. The ancient cathedral of St. Mary is a beautiful structure, and contains the ashes of some Scottish, Irish, and Norwegian kings, as well as the tomb of St. Columba, and many inscriptions relative to the religious ceremonies of the primitive British Christians.

Staffa, one mile long and half a mile broad, is an immense pile of basaltic columns arranged in natural colonades, and exceeding in magnificence any thing of the kind in any other part of the world. The cave of Fingal is a natural cavern, 371 feet long, fifty-three broad, and 117 high, supported by pillars of this substance. A single family inhabit this island.

The *Threshanish* are three islands between Mull and Coll.

Coll is four leagues long and one broad; it is a great rock thinly covered with soil, producing a quantity of kelp, which is exported chiefly to Ireland. It has not a single tree, and several tracts of land formerly cultivated are now rendered barren by the sand blown from the shores. The streams are numerous, and it has forty-eight lakes, abounding in trout. It has a lead mine, not worked; has no foxes, which are met with on the other islands, but abundance of rabbits; contains 1000 inhabitants, and is the property of the duke of Argyle and M'Lean, and with Tirey forms a parish. Locheern on the east is a good harbour.

Tirey is four leagues long and one broad : is generally level and fertile, and has quarries of a fine rose-colored marble. It has no haven for any thing else but boats; has twenty-four lakes, and is said to be unhealthy. It rears cattle, horses and sheep, and exports 250 tons of kelp; a regular ferry boat crosses between this island and Coll, and between the latter and Mull.

Lismore Island, before the entrance of Loch Linne, is a vast mass of limestone, but covered with a good soil. Tradition says it was anciently a deer forest, and very large deer and ox horns are found in the soil. It was also the ancient residence of the bishops of Argyle; it has 1000 inhabitants.

Rum is three leagues long and two broad; has not above 200 inhabitants, who rear cattle and sheep; it has several rivulets, in which are salmon. Loch Serefort on the east is a good harbour.

Egg, four miles long and two broad, is hilly and generally rocky.

Muck, two or three miles long and one broad, is low, with a good soil; but without port, except for boats.

Cannay, three miles long and one broad, is only worthy of notice for a hill, near which the magnetic needle takes a reversed direction, whence it is called Compass Hill. It has a good haven, formed by the little island Sanday, on the north-east. Basaltic columns are seen on its shores.

Sky, the largest of the islands near the main, is fifteen leagues long and from two to six broad, the strait between it and the main is only a quarter of a mile broad in one place, and is the usua. track of ships bound to and from Norway. The whole island is composed of rocky mountains, and the coasts are so indented that every mile presents a harbour. The climate is cold and damp; the rivers abound with salmon, and the sea lochs with sea fish. In 1750 the population was estimated at 15,000, but in 1772 was reduced to 1200, chiefly by emigration to America. *Strath*, the principal place of the island, is on the south-cast. Dunvegan Castle, at the head of Loch Follart, on the north, is the residence of M'Leod, who has the title of laird of Sky.

Of the great number of rocky islets round Sky, one only is noticed by travellers: it is named *Bord Cruin*, or the Round Table, and is the east ernmost of several islets off the point of Slate, the south-west of Sky; it is 500 yards in circuit. with perpendicular sides, leaving but one landing place, from which the ascent to the top is by a spiral path that admits but one person. In the middle of the platform on the summit is a well of fresh water.

Rasay, between Sky and the main, is four leagues long and one broad; though generally rocky, it produces pasture and corn, and has some plane, ash, and fir trees; the highest point is named by the people Dunlan, and by seamen Rasay's Cap. The island has lime and freestone; it is considered the most humid of the chain, having near 300 rainy days in the year.

Rona, north of Rasay, three miles long and one broad, though very stony has some pasture.

The little island *Flodda-huan*, on the north side of Sky, is remarkable for the annual periodical arrival of flocks of plovers from Sky in September, and their return in April.

The western Scottish islands, the Habudes of the ancients, lie in a semicircle from south-west to north-east, and are separated by narrow straits filled with rocks, having the appearance of originally forming one land. The physical construction of this chain is worthy of notice; towards the west they are all flat, while they ascend towards the east, and at last form a precipitous ridge. This conformation exposes them to the whole force of the western winds and waves from the Atlantic, and the encroachment of the sea on this side is very observable. The rocks are primary, and their structure different from that of the continental islands or main land, all of which dip towards the east. The climate of these islands is divided into a wet and dry season, the former commencing in September and lasting till May : the summers are hot. The vegetables that the climate permits to be successfully cultivated are flax, hemp, potatoes, and barley. The sheep and black cattle are small, but numerous. The channel between this chain and the main land is called the Minsh.

The southern cluster is called Bishop's Islands; the other principal ones in succession are *Water*say, three miles long.

Barray, eight miles long and two broad, is intersected by several sea lochs; it is barren and mountainous.

South Uist is thirty miles long and two to three broad; it has several sea lochs, affording good anchorage, and rears numbers of horses, cattle, and sheep.

Benbicula, ten miles in circuit, is only deserving notice for the ruins of a nunnery.

North Uist, five leagues long and three broad,

is hilly on the east and fit for pasture only: on the west it is level, and produces corn ten to twenty fold. Loch Momoddy on the east is a great rendezvous of fishing boats, 400 vessels having loaded here in a season. There are several other inlets for vessels on the east side, but the west is inaccessible.

Berneciary, a little island between North Uist and Harris, has a fresh lake, frequented by innumerable sea birds; it is inhabited, as are those of Pabbay, Calligray, and Eusay.

Harris is a peninsula joined to the island of Lewis by an isthmus a quarter of a mile broad; it belongs to the family of M'Leod, who reside on it, and have constructed a basin and quay for shipping at Loch Lodwell on the east. This island, including Lewis, is mountainous and rocky, except the west coast, which is bordered by a strip of level ground.

Taransay, Scalpay, and Scarp, are three small inhabited islands west of Harris. On the east point of Scalpay is a light-house, and near its west side two good harbours.

west side two good harbours. The Aire of *Lewis*, a peninsula on the east coast, and on the same coast is Stornaway, at the head of a loch, the only town of the Hebrides, with 2000 inhabitants : its houses are of stone slated, and it has a church and custom-house. The Butt of *Lewis*, or Cape Orby, is the north point of the island.

The detached islands belonging to the Hebrides are St. Kilda or Hirta, a solitary rock fifteen leagues off Lewis. It is about three leagues ir circuit, rising to a mountain named Congara, 5400 feet above the sea; its shores are so rocky that there is but one landing place on the east, and this only practicable in fair weather; it is inhabited by about twenty-seven families in a hamlet on the east, who cultivate eighty acres of land, raise cattle, and take sea birds.

Soa is a high steep rock, a mile in circuit, half a mile from the west side of Kilda.

The *Flannan* Islands, or Seven Hunters, are five leagues west of Galleyhead, in Lewis.

Barra and Rona are two high, rocky, and barren islets twenty leagues north of the Butt of Lewis, from which they are visible in clear weather. Rona, the northern, is two miles in circuit, and surrounded by rocks.

In the most northerly isles, the sun, at the summer solstice, is not above an hour under the horizon at midnight, and not longer above it at mid-day in the depth of winter. The soil of the Hebrides varies also in different isles, and in different parts of the same island. Lead mines have been discovered in some of these islands, but not worked to much advantage; others have been found to contain quarries of marble, limestone, and free-stone; nor are they destitute of iron, talc, crystals, and many curious pebbles, some of which emulate the Brasilian topaz. With respect to vegetables, over and above the plentiful harvests of corn that the natives earn from agriculture, and the pot-herbs and roots that are planted in gardens for the sustenance of the people, these islands produce spontaneously a variety of plants and simples, used by the islanders in the cure of their diseases; but there is hardly a shrub or tree to be seen, except in a

very few spots, where some gentlemen have endeavoured to rear them with much more trouble than success. The animals, both of the land and sea, domestic and wild, quadrupeds, fowls, and fishes, found in and about these islands, are of the same species, size, and configuration, with those of the Orkneys.

Mr. Pennant has given a full history of these islands from their supposed visitation by Pytheas. If we may credit our Saxon historians, they appear to have been early under the dominion of the Picts. The first invasion of the Danes does not seem to be easily ascertained. It appears that they ravaged Ireland, and the isle Rathry, as early as the year 735. In the following century their expeditions became more frequent. Harold Harfager, or the lighthaired, pursued hither, in 875, several petty princes, whom he had expelled out of Norway. He seems to have made a rapid conquest: put to death the chief of the pirates, and made an indiscriminate slaughter of their followers. Soon after his return the islanders re-possessed their ancient seats : and, in order to repress their insults, he sent Ketil, the flat-nosed, with a fleet and some forces for that purpose. This chief soon reduced them to terms, and sent back the fleet to Harold; openly declared himself the independent prince of the Hebrides; and caused them to acknowledge him as such, by the payment of tribute. Ketil remained, during life, master of the islands; and his subjects appear to have been a set of warlike freebooters. After the death of Ketil a kingdom was in aftertimes composed out of them, which, from the residence of the little monarch in the Isle of Man, was styled that of Man. The islands became tributary to that of Norway for a considerable time, and princes were sent thence to govern; but at length they again shook off the yoke. From the chronicles of the kings of Man we learn, that they had then a succession of princes. In 1093 Donald Bane, king of Scotland, called in the assistance of Magnus, the barefooted, king of Norway, and bribed him with the promise of all the islands. Magnus accepted the terms; but at the same time boasted that he did not come to invade the territories of others, but only to resume the ancient rights of Norway. His conquests were rapid and complete; for, besides the islands, by an ingenious fraud, he added Cantyre to his dominions. The Hebrides continued governed by a prince dependent on Norway. These viceroys were sometimes Norwegians, sometimes natives of the isles. In 1097 we find, that Magnus deputed a nobleman of the name of Ingemund; in after times we learn, that natives were appointed to that high office. Thus were the Hebrides governed, from the conquest by Magnus, till the year 1263, when Acho, or Haquin, king of Norway, by an unfortunate invasion of Scotland, terminating in his defeat at Largs, so weakened the powers of his kingdom, that his successor Magnus IV. was content to make a cession of the islands to Alexander III.; but not without stipulating for the payment of a large sum, and of a tribute of 100 marks for ever, which bore the name of the annual of Norway.

VOL. XI

The islands still remained governed by powerful chieftains, who were the scourges of the kingdom. Encouraged by their distance from the seat of royalty, and the turbulence of the times, they exercised a regal power, and often assumed the title; but are more generally known in history by the style of the lords of the isles, or the earls of Ross; and sometimes by that of the Great M'Donald. Historians are silent about their proceedings, from the retreat of the Danes, in 1263, till that of 1533, when John, lord of the isles, withdrew his allegiance. In the beginning of the next century his successors were so independent, that Henry IV. entered into a formal alliance with the brothers Donald and John. This encouraged them to commit fresh hostilities against their natural prince. Donald, under a pretence of a claim to the earldom of Ross, invaded and made a conquest of that county; but, penetrating as far as the shire of Aberdeen, after a fierce but undecisive battle with the royal party, thought proper to retire, and in a little time to swear allegiance to his monarch, James I. of Scotland. But he was permitted to retain the county of Ross, and assume the title of earl. His successor, Alexander, at the head of 10,000 men, attacked and burnt Inverness; at length, terrified with the preparations made against him, he fell at the royal feet, and obtained pardon as to life, but was committed to strict confinement. His kinsman and deputy, Donald Balloch, resenting the imprisonment of his chieftain, excited another rebellion, and destroyed the country with fire and sword : but on his flight was taken and put to death by an Irish chieftain, with whom he sought protection.

In the reign of James II., in 1461, Donald another petty tyrant, an earl of Ross, and lord of the isles, renewed the claim of independency; surprised the castle of Inverness; forced his way as far as Athol; and obliged the earl and countess, with the principal inhabitants, to seek refuge in the church of St. Bridget, in hope of finding security from his cruelty by the sanctity of the place; but the barbarian and his followers set fire to the church, put the ecclesi-astics to the sword, and, with a great booty, carried the earl and the countess prisoners to his castle of Claig, in the island of Ilay. In a second expedition, immediately following the first, he suffered the penalty of his impiety : a tempest overtook him, and overwhelmed most of his associates; and he, escaping to Inverness, perished by the hands of an Irish harper : his surviving followers returned to Ilay, conveyed the earl and countess of Athol to the sanctuary they had violated, and explated their crime by restoring the plunder, and making large donations to the shrine of the offended John, successor to the last earl of Ross, saint. entered into alliance with Edward IV., and sent ambassadors to the court of England, where Edward empowered the bishop of Durham and carl of Winchester to conclude a treaty with him, another Donald Balloch, and his son and heir, John. They agreed to serve the king with all their power, and so became his subjects: the earl was to have 100 marks sterling for life in

h

time of peace, and £200 in time of war; and these island allies, in case of the conquest of Scotland, were to have confirmed to them all the possessions north of the Scottish sea; and, in case of a truce with the Scottish monarch, they were to be included in it. But about the year 1476 Edward, from a change of politics, courted the alliance of James III. and dropt bis new allies. James, being determined to subdue this rebellious race, sent against them a powerful army under the earl of Athol. Ross was terrified into submission; obtained his pardon; but was deprived of his earldom, which by act of parliament was then declared unalienably annexed to the crown; at the same time the king restored to him Knapdale and Cantyre, which the earl had resigned; and invested him anew with the lordship of the isles, to hold them of the king by service and relief. Thus the great power of the lords of the isles was broken; yet, for a considerable time after, the petty chieftains were continually breaking out into small rebellions, or harassed each other in private wars ; and tyranuy seems but to have been multiplied. James V. found it necessary to make the voyage of the isles in person in 1536, seized and brought away with him several of the most considerable leaders, and obliged them to find security for their own good behaviour and that of their vassals. The troubles that succeeded the death of James occasioned a neglect of these insulated parts of the Scottish dominions, and left them in a state of anarchy. In 1614 the M'Donalds made a formidable insurrection, oppugning the royal grant of Cantyre to the earl of Argyle and his relations. The petty chieftains continued in a sort of rebellion; and the sword of the greater, as usual in weak governments, was employed against them. The encouragement and protection given by them to pirates employed the power of the Campbells during the reign of James VI. and the beginning of that of Charles I. But the turbulent spirit of the old times continued even to the present age. The heads of clans were, by the divisions, and a false policy that predominated in Scot-land during the reign of William III., flattered with an unreal importance: instead of being treated as bad subjects, they were courted as de-sirable allies : instead of feeling the hand of power, money was allowed to bribe them into the loyalty of the times. They would have accepted the subsidies, notwithstanding they detested the prince that offered them. They were taught to believe themselves of a consequence, that afterwards turned to their destruction. At last two rebellions gave the legislature a late experience of the folly of permitting the feudal system to exist in any part of its dominions; and the act of 1748, for abolishing heritable jurisdictions, at once deprived the chieftains of all power of injuring the public by their commotions.

The people inhabiting these islands are of the same race with those who live in the Highlands of Scotland; speak the same language, wear the same habit, and observe the same customs. See HIGHLANDERS.

The commodities which may be deemed the

staples of this country are black cattle, sheep, and fish, which they sell to their fellow-subjects of Scotland. Part of the wool they work up into knit stockings, coarse cloth, and that variegated stuff called tartan. They likewise salt mutton in the hide, and export it in boats or barklings to different parts of the main-land. Cod, ling, mackarel, whitings, haddocks, and soles, are here caught in abundance, together with a small red cod, remarkably voracious, of a very delicate flavour: there are likewise two kinds of white fish, which seem to be peculiar to this coast, known by the names of lithe and eea, esteemed good eating. But the greatest treasure the ocean pours forth is the prodigious quantity of herrings. See HERRING and FISHERY.

HEBRIDES, NEW, a cluster of islands in the Pacific Ocean, so named by captain Cook. The northern islands of this archipelago were first discovered by the navigator Quiros, in 1606, who supposed them to be a part of a southern continent. They were next visited by M. de Bougainville in 1768, who, landing on the island of Lepers, discovered that the land was not connected, but composed of islands, which he called the Great Cyclades. Captain Cook explored the whole eluster, and, besides ascertaining the extent and situation of these islands, added the knowledge of several others. They extend 375 miles, from N. N. W to S. S. E. The natives are civil and hospitable; of a slender make, and dark color, and have mostly frizzled The productions are cocoa-nuts, breadhair. fruit, plantains, sugar-canes, yams, &c. The most northern part of this archipelago was called by M. de Bougainville the Peak of the Etoile. The whole cluster consists of the following islands; some of which have received names from the different European navigators, others retain the names which they bear among the natives : viz. Tierra del Espiritu Santo, Mallicollo, St. Bartholomew, Isle of Lepers, Aurora, Whitsuntide, Ambrym, Immer, Apee, Three Hills, Sandwich, Montagu, Hinchinbrook, Shepherd, Erromanga, Erronau, Anattom, and Tanna. They are situated between 166° 40' and 170° 21' E. long., and between 14° 25' and 20° 4 S. lat.

HEBRON, in ancient geography, a city seated in the hilly country of the tribe of Judah to the south. Its more ancient name was Kirjath-arba, or Cariath-arba. In antiquity it vied with the more ancient cities of Egypt, being seven years prior to Zoan. Josephus makes it not only older than Tanis, but even than Memphis. It stood to the west of the lake Asphaltites, and was for some time the royal residence of David. After the captivity it fell into the hands of the Edomites, as did all the south country of Judea. It is now called Habroun. The Arabs call it El-kalil, i. e. the well-beloved ; the epithet they usually apply to Abraham, whose sepulchral grotto they pretend to show. It is seated at the foot of an eminence, on which are some wretched ruins of an ancient castle. The adjacent country is a sort of oblong hollow, five or six leagues in length, varied by rocky hillocks, groves of fir trees, stunted oaks, and a few plantations of vines and olive trees. These vineyards are not

cultivated with a view to make wine, the inhabitants being so zealous Mahommedans as not to permit any Christians to live among them : they are only of use to procure dried raisins, which are badly prepared, though the grapes are excellent. The peasants cultivate cotton, which is spun by their wives, and sold at Jerusalem and Gaza. They have also some soap manufactories, the kall for which is sold by the Bedouins; and a very ancient glass-house, the only one in Syria, wherein they make a great quantity of colored rings, bracelets for the wrists, legs, and arms, with various other trinkets, which are sent to Constantinople.

HEBRON, a township of New York, United States, in Washington county. Population 2436. -There is also a township of this name in Tolland county, Connecticut; and another in Cumberland county, Maine. It is also the name of a Moravian settlement in Pennsylvania.

HEBRUS, in ancient geography, the largest river of Thrace, rising from Mount Scombrus, running in two channels to Philippopolis, where they unite. It runs by two mouths into the Ægean Sea, north of Samothrace. It was supposed to roll its waters upon golden sands. The head of Orpheus was thrown into it, after it had been cut off by the Ciconian women.

HEBRUS, a city of Thrace, on the above river.

HEBTICH, or HEBITCH, a town of Germany, in the ei-devant county of Sponheim, annexed to the French republic by the treaty of Luneville in 1801, and included in the department of the Rhine and Moselle; two miles south-east of Taarbach.

HEBUDÆ, HEBUDES, or ÆBUDÆ, in ancient geography, islands on the west of Scotland. The ancients differed greatly as to their situation, number, and names; said in general to lie on the north of Ireland, and west of Scotland. They are now called the Western Islands, and Hebrides; which last is a modern name, supposed to be a corruption of Hebudes. By Beda they are called Mevania, an appellation equally obscure. See HEBRIDES.

HECATE, in mythology, a name of Diana. She was called Luna in heaven, Diana on earth, and Hecate or Proserpine in hell; whence her name of Diva triformis, tergemina, triceps. She was supposed to preside over enchantments. She was generally represented like a woman, with the head of a horse, a dog, or a boar; and sometimes she appeared with three different bodies, and three faces, with one neck. Dogs, lambs, and honey were generally offered to her, especially in ways and cross roads, whence she obtained the name of Trivia. Her power was extended over heaven, earth, sea, and hell; and to her kings and nations supposed themselves indebted for their prosperity.

HECATE, in fabulous history, a queen of Taurica Chersonesus, daughter of Perses and Asteria, who poisoned her father; by some confounded with Hecate, the sister of Apollo

HECATESIA, εκατεσια, in antiquity, an annual solemnity observed by the Stratonicensians, in honor of Hecate. The Athenians likewise had a public entertainment or supper every new moon, in honor of this goddess. The supper was provided at the charge of the rich; and was no sooner brought to the accustomed place but the poor carried all off, giving out that Hecate had devoured it. For the rest of the ceremonies observed on this occasion, see Pott. Arch. Græc.

HE'CATOMB, n. s. Fr. hecatombe ; ἑκατόμβη. A sacrifice of a hundred cattle.

In rich men's homes I bid kill some beasts, but no hecatombs ; None starve, none surfeit so.

Donne. One of these three is a whole hecatomb, And therefore only one of them shall die .

Dryden.

Her triumphant sons in war succeed, And slaughtered hecatombs around 'em bleed.

Addison.

A HECATOMB, in antiquity, was a sacrifice of 100 beasts of the same kind, at 100 altars, and by 100 priests or sacrificers. The Greek word, εκατομβη, properly signifies a magnificent sacrifice. Others derive it from the Greek exarov, a hundred, and Bovs, a bullock; others from $\varepsilon \kappa \alpha \tau o \nu$ and $\pi o \nu \varsigma$, a foot; on which principle they hold, that the hecatomb might consist of only twenty-five four-footed beasts; and that it did not matter what kind of beasts were chosen for victims, provided there were but 100 feet. Pythagoras is said to have sacrificed a heeatomb to the Muses of 100 oxen, in gratitude for discovering the demonstration of the forty-seventh problem of Euclid. Strabo relates, that there were 100 cities in Laconia, and that each city used to sacrifice a bullock every year for the common safety of the country; whence the institution of hecatombs. Others refer the origin of hecatombs to a plague, wherewith the 100. cities of Peloponnesus were afflicted; for the removal whereof, they jointly contributed to offer so splendid a sacrifice. Julius Capitolinus relates, that for a hecatomb they erected altars of turf, and on these sacrificed 100 sheep, and 100 hogs. He adds, that when the emperors offered saerifices of this kind, they sacrificed 100 lions, 100 eagles, and 100 other wild animals.

HECATOMBÆON, εκατομβαιων, in chronology, the first month of the Athenian year. It consisted of thirty days, and began on the first new moon after the summer solstice ; answering to the latter part of June and beginning of July. The Bootians called it Hippodromus, and the Macedonians Lous. The word is derived from the Greek $\epsilon \kappa a \tau o \mu \beta \eta$, a heeatomb, because of the great number of hecatombs sacrificed in it.

HECATOMPOLIS, a surname of Crete, from its 100 cities. The territory of Laconia also had anciently this name for the same reason.

HECATOMPYLOS, in ancient geography, the metropolis of Parthia, and royal residence of Arsaces, situated at the springs of the Araxes. Thebes in Egypt had also the same mame from its 100 gates.

HECHT (Christian), a learned divine, born at Essen, in East Friesland, in 1696. He wrote 1. Commentatio Philologica : critica exegetica, &c. 2. Antiquæ Hebræorum inter Judæos in Po-Ionia. He died in 1748, aged fifty-two.

HECLA, or HEKLA, a volcanic mountain of Iceland, and one of the most celebrated in the world. See ICELAND. It was visited in 1772 by Dr. Van Troil, a Swedish gentleman, along with Mr., afterwards Sir Joseph, Banks; and subsequently, in 1810, by Sir George M'Kenzie. The latter intelligent traveller thus gives us its chief features and history:—

'After the fatigue we had undergone in our excursion towards the Torfa Jokul, in search of obsidianum, we did not expect to find ourselves sufficiently refreshed to attempt ascending Mount Hecla on the following day; but, as we had been long in the constant habit of enduring daily hardships, we rose at an early hour on the 3d of August, quite alert; and, on seeing the whole of the mountain free from clouds, we were soon ready to finish our labors by ascending Heela, and attaining the summit of a mountain whose fame has spread to every quarter of the world. At ten o'clock we were ready; and, Brandtson having collected our horses, we mounted them, and began our expedition under circumstances as favorable as we could wish. We rode through sand and lava about three miles, when the surface became too rugged and steep for horses. Our guide proposed leaving the poor animals standing till we returned ; but, though they would not have stirred from the spot, we sent them back, not choosing that such valuable and steady servants should remain a whole day without food. We now proceeded a considerable way along the edge of a stream of lava, and then crossed it where it was not very broad, and gained the foot of the south end of the mountain. From this place we saw several mounts and hollows, from which the streams of lava below appeared to have flowed. While we had to pass over rugged lava, we experienced no great difficulty in advancing; but when we arrived at the steepest part of the mountain, which was covered with loose slags, we sometimes lost at one step, by their yielding, a space that had been gained by several. In some places we saw collections of black sand, which, had there been any wind, might have proved extremely troublesome. The ascent now became very steep, hut the roughness of the surface greatly assisted us.

'Before we had reached the first summit, clouds surrounded us, and prevented our seeing farther than a few yards. Placing implicit confidence in our guide, we proceeded; and, having attained what we thought was the nearest of the three summits, we sat down to refresh ourselves, when Brandtson told us that he had never been higher up the mountain. The clouds occasionally dividing, we saw that we had not yet reached the southern summit. After having passed a num-ber of fissures, by leaping across some and stepping along masses of slags that lay over others, we at last got to the top of the first peak. The clouds now became so thick that we began to despair of being able to proceed any farther. Indeed it was dangerous even to move; for the peak consists of a very narrow ridge of slags, not more than two feet broad, having a precipice on each side many hundred feet high. One of these precipices forms the side of a vast hollow, which seems to have been one of the craters. At

length the sky cleared a little, and enabled us to discover a ridge below that seemed to connect the peak we were on with the middle one. We lost no time in availing ourselves of this opportunity, and, by halancing ourselves like ropedancers, we succeeded in passing along a ridge of slags so narrow that there was hardly room for our feet. After a short but very steep ascent we gained the highest point of this celebrated mountain.

We now found that our usual good fortune had not yet forsaken us; for we had scarcely begun to accend the middle peak when the sky became clear, and we had a full view of the surrounding country. Towards the north it is low, except where a Jokul here and there towers into the regions of perpetual snow. Several large lakes appeared in different places, and among them the Fiske Vatn was the most conspicuous. In this direction we saw nearly twothirds across the island. The Blæfell and the Lange Jokuls stretched themselves in the distance to a great extent, presenting the appearance of enormous masses of snow heaped up on the plains. The Skaptar Jokul, whence the great eruption that took place in the year 1783 broke forth, bounded the view towards the north-east. It is a large, extensive, and lofty mountain, and appeared to be covered with snow to the very base. On the side next to us, though at a distance of about forty miles, we plainly discerned a black conical hill, which very probably may be one of the craters that were formed during the eruption. The Torfa, Tinfialla, and Eyafialla Jokuls, limit the view of the eastern part of the country. Towards the south the great plain we had passed through seemed as if stretched under our feet, and was bounded by the sea. The same valley was terminated towards the west by a range of curiously peaked mountains, those in the neighbourhood of Thingvalla, and to the north and west of the Geysers.

'The middle peak of Hecla forms one side of a hollow, which contains a large mass of snow at the bottom, and is evidently another crater. The whole summit of the mountain is a ridge of slags; and the hollows on each side appear to have been so many different vents from which the eruptions have from time to time issued. We saw no indications that lava had flowed from the upper part of the mountain; but our examination, from the frequent recurrence of fog, was unavoidably confined. After we had satisfied ourselves, in surveying the surrounding country, we began to collect specimens of the slags, and perceived some of them to be warm. On removing some from the surface we found those below were too hot to be handled; and, on placing a thermometer amongst them, it rose to 144°. The vapor of water ascended from several parts of the peak. It had been remarked to us, by many of the inhabitants, that there was less snow on Hecla at this time than had been observed for many years. We supposed, therefore, that the heat now noticed might be the recommencement of activity in the volcano, rather than the remaining effects of the last eruption, which took place in the year 1766.

'The crater, of which the highest peak forms

a part, does not much exceed 100 feet in depth. The bottom is filled by a large mass of snow, in which various caverns had been formed by its partial melting. In these the snow had become solid and transparent, reflecting a bluish tinge; and their whole appearance was extremely beautiful, reminding us of the description of magic palaces in eastern tales. At the foot of the mountain the thermometer at half past nine o'clock stood at 55°. At eleven it was 55°, and at four, on the top, at 39°. Our descent was greatly retarded by thick fog; and we found it much more hazardous than the ascent. We missed our way, and were under the necessity of crossing the lava we had passed in our way up, at a place where it had spread to a much greater breadth, and, from the rapidity of the slope along which it had flowed, had become frightfully rugged.

'Mount Hecla has acquired a degree of distinction, among volcanoes, to which it does not seem to be entitled. It is far behind Ætna and Vesuvius, both in the frequency and magnitude of its eruptions. We could not distinguish more than four streams of lava; three of which have descended on the south, and one on the north side; but there may be some streams on the east side, which we did not see. The early eruptions of this mountain do not seem to have been regularly recorded. Olafson and Paulson say, that, after careful research, they found that the number of eruptions amounted to twenty-two; and none are recorded as having happened before the year 1004. There were eruptions in the years 1137, 1222, 1300, 1341, 1362, 1389, 1538, 1619, 1636, and 1693. Flames appeared in the neighbourhood in 1728. In 1554 there were eruptions from the mountains to the eastward; and ir 1754 flames burst out to the westward. From the mountain itself no eruption took place between the years 1693 and 1766, an interval of seventy-three years; and, during this last period of activity, no lava was thrown out. The following year flames broke out afresh, and the mountain was not perfectly quiet in the year 1768: since that time it has remained inactive. We had no opportunity of measuring the height of Mount Hecla; but we have been informed by Sir J. Stanley that the elevation which resulted from his observations was 4300 feet, and this, from different circumstances, we believe to be correct.

'The whole tract between Hecla and Krabla is a desert quite impassable and unknown; and there is still subsisting a ridiculous notion that it is inhabited by a tribe of robbers. Did such people really exist, and did they know the dread which they inspire, they might easily procure more comfortable quarters.' See lCELAND.

HECQUET (Philip), a French physician of considerable eminence, and author of several works on medicine. But, being a great advocate for the use of warm water and copious bleeding, in many diseases, his practice was ridiculed by M. Le Sage, in his ingenious satirical novel of Gil Blas; wherein he is caricatured under the character of Dr. Sangrado. He died in 1737.

 11E/CT1C, n. s. & adj. }
 Fr. hectique; from

 HE'CTICAL, adj.
 \$Gr. έξις.

 Scoustitutional: a fever so called; morbid heat.

 See MEDICINE.

Like the hectick in my blood he rages,

And thou must cure me. Shakspeare. Hamlet. A heetick fever hath got hold

Of the whole substance, not to be controuled.

No hectick student scares the gentle maid. Taylor. Can this be death? there's bloom upon her cheek; But I see it is no living huc,

But a strange hectic-like unnatural red

Which Autumn paints upon the perished leaf. Byron's Manfred.

HEC'TOR, *n.s.*, *v. a.* & *v. n.* From the name of Hector, the great Homeric warrior. A bully; a blustering, turbulent, pervicacious, noisy fellow. The verbs signify to domineer or bully; to treat with insolence; to threaten.

They have attacked me, some with piteous moans and outcries, others grinning and only shewing their teeth, others ranting and hectoring, others scolding and reviling. Stillingfleet.

The weak low spirit Fortune makes her slave; But she's a drudge, when *hectored* by the brave.

Dryden.

Those usurping *hectors*, who pretend to honour without religion, think the charge of a lye a blot not to be washed out but by blood. South.

One would think the *hectoring*, the storming, the sullen, and all the different species of the angry should be cured. Spectator,

They reckon they must part with honour together with their opinion, if they suffer themselves to be hectored out of it. Government of the Tongue.

We'll take one cooling cup of nectar,

And drink to this celestial hector. Prior. An honest man, when he came hone at night, found another fellow domineering in his family, hectoring his servants, and calling for supper.

Arbuthnot's History of John Bull.

Don Carlos made her chief director,

That she might o'er the servants hector. Swift.

HECTOR, the son of Priam and Hecuba, and the father of Astyanax, celebrated for the valor with which he defended the city of Troy against the Greeks. He was killed by Achilles, who dragged his body, fastened to his chariot, thrice round the walls of Troy, and afterwards restored it to Priam for a large ransom. See TROY.

HECUBA, in fabulous history, the wife of Priam, the last king of Troy, and the mother of anneteen of his fifty-three children. She was the daughter of Dymas, according to Homer, or of Cisseus, according to Virgil. When with child of Paris she dreamed that she brought forth a firebrand. See PARIS. After the destruction of Troy she was carried captive by Ulysses, and in a fit of insanity for her misfortune threw herself into the Hellespont; whereupon she was fabled to have been turned into a bitch.

HEDERA, ivy, in botany, a genus of the monogynia order, and pentandria class of plants; natural order forty-sixth, hederaceae. There are five oblong petals: the berry is pentaspermous, girt by the calyx.

H. dionysias, or poet's-ivy, a species that grows in many of the islands of the Archipelago; so named by Caspar Bauhine and Tournefort,

Donne.

134

because the ancients made crowns of it for adorning the brows of their poets. It is called dionysias, because they also made use of it in their public feasts, in honor of Bacchus. The berries are of a fine gold color, whence it has been termed by others chrysocarpos.

II. helix, or common ivy, grows naturally in many parts of Britain; and, where it meets with any support, will rise to a great height, sending out roots on every side, which strike into the joints of walls or the bark of trees. If there is no support, they trail on the ground, and take root all their length, so that they closely cover the surface, and are difficult to eradicate. While these stalks are fixed to any support, or trail upon the ground, they are slender and flexible; but when they have reached to the top of their support, they shorten and become woody, forming themselves into large bushy heads; and their leaves are larger, more of an oval shape, and not divided into lobes like the lower leaves, so that it has quite a different appearance. There are two varieties of this species, one with silver-striped leaves, the other with yellowish leaves on the tops of the branches; and these are sometimes admitted into gardens. They are easily propagated, and thrive in any soil. The roots are used by leather-cutters to whet their knives upon. Apricots and peaches covered with ivy, bear fruit plentifully in February. The leaves have a nauseous taste; Haller says, they are given to children in Germany, as a specific for the atrophy. The people of England apply them to issues; and an ointment made from them is in great esteem among our Scots Highlanders as a ready cure for burns. The berries have a little acidity. When fully ripe, a dose of them has been recommended in the In warm climates, a resinous juice plague. exudes from the stalks, which is said to be a powerful resolvent and discutient, and an excellent ingredient in plasters and ointments adapted for these purposes. Horses and sheep eat the plant; goats and cows refuse it.

II. quinquefolia, the Virginian creeper, is a native of all the northern parts of America. It was first brought to Europe from Canada; and has been long cultivated in the British gardens, chiefly to plant against walls or buildings to cover them: which these plants will do in a short time; for they will shoot almost twenty feet in one year, and will mount up to the top of the highest building : but, as the leaves fall off in autumn, the plants make but an indifferent appearance in winter, and therefore are proper only for such situations as will not admit of better plants; for this will thrive in the midst of cities, and is not injured by smoke or the closeness of the air. It may be propagated by cuttings; which, if planted in autumn in a shady border, will take root, and by the following autumn will be fit to plant in those places where they are to remain.

HEDERACEÆ, from hedera, ivy. The fortysixth order in Linnæus's fragments of a natural method. See BOTANY.

HEDERICII, or HEDERICUS (Benjamin), a learned lexicographer, born at Hain in Misnia, in 1675. He published a valuable Greek and Latin lexicon, and an edition of Empedocles de Sphæra. He died in 1748.

HEDGE, n. s. & v. a. Sax. pezze; Belg. HEDG'ER, n. s. & haag, hag. A fence made round grounds with prickly bushes, or woven twigs; to enclose; to obstruct; to encircle for defence; sometimes improperly written for edge; to shift; to hide the head. Hedge, prefixed to any word, notes something mean, vile, of the lowest class: perhaps from a hedge, or hedge-born man, a man without any known place of birth.

I will hedge up thy way with thorns.

Hosea ii. 6. Hedge thy possession about with thorns.

Eccles.

And after that, within a litel throw, The wind began so sturdily to blow, That down goth all the flowres, everichone So that, in all the mede there left not one, Save such as succoured were, among the leves Fro every storme that mightè hem assaile, Growing under the *hegges* and thick greves.

Chaucer. The Floure and the Leafe. I myself sometimes, hiding mine honour in my necessity, am fain to shuffle, to hedge, and to lurch.

Shakspeare.

England, hedged in with the main, That water-walled bulwark, still secure

And confident from foreign purposes. Id.

There's such divinity doth hedge a king, That treason can but peep to what it would. Id.

Those alleys must be hedged at both ends, to keep out the wind. Bacon.

The hedge, green satin pinked and cut, arrays The heliotrope to cloth of gold aspires;

In hundred-coloured silks the tulip plays ;

The' imperial flower, his neck with pearl attires. Fletcher's Purple Island.

The laboured ox

In his loose traces from the furrow came, And the swinked *hedger* at his supper sat.

Milton.

When I was hasty, thou delay'dst me longer : I pr'thee, let me *hedge* one moment more Into thy promise; for thy life preserved.

Dryden.

It must not be paid and exported in ready money; so says our law; but that is a law to *hedge* in the cuckow, and serves for no purpose: for if we export not goods, for which our merchants have money due to them, how can it be paid by bills of exchange.

Locke.

He would be laughed at, that should go about to make a fine dancer out of a country hedger at past fifty. Id.

It is a good wood for fire, if kept dry; and is very useful for stakes in hedges. Mortimer.

The gardens unfold variety of colours to the eye, every morning, and the *hedges* breath is beyond all perfume. *Pope*.

A person, who, by his style and literature, seems to have been the corrector of a *hedge*-press in Little Britain, proceeded gradually to an author. Swift.

The clergy do much better than a little *hedge*, contemptible, illiterate viear can be presumed to do.

When you are sent on an errand, be sure to hedge in some business of your own. Id.

Through the verdant maze

Of sweet-briar hedges, I pursue my walk.

Thomson.

Among the crooked lanes, on every hedge, The glow-worm lights his gem; and through the

dark, A moving radiance twinkles.

Thomson's Seasons. Summer.

HEDGES, in agriculture, are either planted to make fences round enclosures, or to divide the several parts of a garden. When they are designed as outward fences, they are planted either with hawthorn, crabs, or black-thorn; but those hedges which are planted in gardens, either to surround wilderness quarters, or to screen the other parts of a garden from sight, are planted according to the fancy of the owner. Some prefer ever-greens, in which case the holly is best; next the yew, then the laurel, laurustinus, phyllyrea, &c. Others prefer the beech, the hornbeam, and the elm.

Before planting the hedge in the open field, it is proper to consider the nature of the land, what sort of plants will thrive best in it; and what is the soil whence they are to be taken. The sets ought to be about the thickness of one's little finger, and cut within about four or five inches of the ground; they ought to be fresh taken up, straight, smooth, and well-rooted. Those plants that are raised in the nursery are to be preferred. In planting outside hedges the turf is to be laid with the grassy side downwards, on that side of the ditch on which the bank is designed to be made; and some of the best mould should be laid upon it to bed the quick, which is set upon it at a foot asunder. When the first row of hawthorn or quick is set, it must be covered with mould; and, when the bank is a foot high, another row of sets may be laid against the spaces of the former, and covered like the others. The bank is then to be topped with the bottom of the ditch, and a dry or dead hedge laid, to shade and defend the under plantation. Stakes should then be driven into the loose earth, so low as to reach the firm ground : these are to be placed at about two feet and a half distance : to render the hedge yet stronger, edder it, that is, bind the top of the stakes with small long poles, and, when the eddering is finished, drive the stakes anew. The quick must be kept constantly weeded, and secured from being cropped by cattle; and in February it will be proper to cut it within an inch of the ground, which will cause it to strike root afresh, and help it much in the growth. The crab is frequently planted for hedges. Plants raised from the kernels of the small wild crabs are to be preferred to those raised from the kernels of all sorts of apples without distinction; because the plants of the true small crab never shoot so strong as those of the apples, and may therefore be better kept within the proper compass of a hedge. The black thorn, or sloe, is often planted for hedges. The best method is to raise the plant from the stones of the fruit, which should be sown about the middle of January, if the weather permit, in the place where the hedge is intended.

With respect to the age at which hedge-plants ought to be used, it is very common, especially where young hedges are made with thorns, to plant them of one, two, or three years old, el-

dom exceeding this last age. Plants of this description, says Mr. Loudon, however, are long in a state of infancy, and require great nursing and the most complete protection to bring them to perfection, and are hable to be either much hurt or totally destroyed by many accidents that would produce little or no effect upon older and stronger plants. Much time might be saved in the rearing of hedges, and the fences be much more perfect and useful, if older plants were employed for that purpose. Three years old is certainly the youngest that should be planted, and, if they are six or seven years old, so much the better : the prevailing idea that plants of that age will not thrive, if transplanted, is totally unfounded.

Hedges for ornament in gardens are sometimes planted with ever-greens, in which case the holly is preferable to any other; next to this most people prefer the yew; but the dead color of its leaves renders those hedges less agreeable. The laurel is one of the most beautiful ever-greens; but the shoots are so luxuriant that it is difficult to keep it in any tolerable shape; and, as the leaves are large, to prevent the disagreeable appearance given them by their being cut through with the shears, it will be best to prune them with a knife, cutting the shoots just down to a leaf. The laurustinus is a very fine plant for this purpose; but the same objection may be made to this as to the laurel; this, therefore, ought only to be pruned with a knife in April, when the flowers are going off; but the new shoots of the same spring must by no means be shortened. The small-leaved and rough-leaved laurustinus are the best plants for this purpose. The true phillyrea is the next best plant for hedges, which may be led up to the height of ten or twelve feet; and if they are kept narrow at the top, that there may not be too much width for the snow to lodge upon them, they will be close and thick, and make a fine appearance. The ilex, or ever-green oak, is also planted for hedges, and is a fit plant for those designed to grow very tall. The deciduous plants usually planted to form hedges in gardens are, the hornbeam, which may be kept neat with less trouble than most other plants; the beech, which has the same good qualities as the hornbeam : but the gradual falling of its leaves in winter causes a continual litter. The small-leaved English elm is a proper tree for tall hedges, but these should not be planted closer than eight or ten feet. The lime-tree has also been recommended for the same purpose; but, after they have stood some years, they grow very thin at bottom, and their leaves frequently turn of a black disagreeable color. Many of the flowering shrubs have also been planted in hedges, such as roses, honcysuckles, sweet briar, &c. ; but these are difficult to train; and, if they are cut to bring them within compass, their flowers, which are their greatest beauty, will be entirely destroyed.

From the first year of planting, till the hedge has risen to the height of five or six feet, the main stems ought to be left untouched, and the pruning confined solely to the side branches, leaving those next the root pretty long, and gradually tapering towards the top; this pruning of the side branches will make them send out many new shoots from their extremities; while the main stems, by being left untouched, continue their growth upward, when they may have their extremities cut off with perfect safety. When a hedge has attained the wished-for height, all that is requisite afterwards is cutting the sides regular with a hedge-bill, preserving it pretty broad at bottom, and drawing it gradually to a point at top; a hedge of this form is pleasant to the eye, is well calculated to stand the weather, and becomes every year stronger and thicker.

It sometimes happens, says Dr. Anderson, that a hedge may have been long neglected, and be in general in a healthy state, but full of gaps and openings, or so thin and straggling as to form but a very imperfect sort of fence. On these occasions, it is in vain to hope to fill up the gaps by planting young quicks; for these would always be outgrown, choked, and starved, by the old plants; not could it be recovered by cutting clear over by the roots, as the gaps would still continue where they formerly were. The only methods that I know of rendering this a fence are, either to mend up the gaps with dead wood, or to plash the hedge; which last operation is always the most eligible where the gaps are not too large to admit of being cured by this means. The operation I here call plashing, may be defined, a wattling made of living wood. To form this, some stems are first selected, to be left as stakes at proper distances, the tops of which are all cut over at the height of four feet from the root. The straggling side branches of the other part of the hedge are also lopped away. Several of the remaining plants are then cut over, close by the ground, at convenient distances; and the remaining plants are cut perhaps half through, so as to permit them to be bent to one side. They are then bent down almost to a horizontal position, and interwoven with the upright stakes, so as to retain them in that position. Care ought to be taken, that these be laid very low at those places where there were formerly gaps; which ought to be farther strengthened by some dead stakes or truncheors of willows, which will frequently take root in this case, and continue to live. And sometimes a plant of eglantine will he able to overcome the difficulties it meets with, strike root, and grow up so as to strengthen the hedge in a most effectual manner. The operator begins at one end of the field, and proceeds regularly forward, bending all the stems in one direction, so that the points rise above the roots of the others, till the whole wattling is completed to the same height as the uprights. An expert operator will perform this work with much greater expedition, than one who has not seen it done could easily imagine. And as all the diagonal wattlings continue to live and send out shoots from many parts of their stems, and, as the upright shoots that rise from the stumps of those plants that have been cut over quickly rush up through the whole hedge, these serve to unite the whole into one entire mass, that forms a strong, durable, and beautiful fence. This is the best method of recovering an old neglected hedge that has as yet come to my knowledge.

In some cases it happens, that the young shoots of a hedge are killed every winter; in which case it soon becomes dead and unsightly, and can never rise to any considerable height. A remedy for this disease may therefore be wished for. Young hedges are observed to be chiefly affected with this disorder; and it is almost always occasioned by an injudicious management of the hedge, by means of which it has been forced to send out too great a number of shoots in summer, and is thus rendered so weakly as to be unable to resist the severe weather in winter. It often happens that the owner of a young hedge, with a view to render it very thick and close, cuts it over with the shears a few inches above the ground the first winter after planting : in consequence of which, many small shoots spring out from each of the stems that has been cut over; each of which, being afterwards cut over in the same manner, sends forth a still greater number of shoots, which are smaller and smaller in proportion to their number. If the soil in which the hedge has been planted is poor, in consequence of this management, the branches, after a few years, become so numerous, that the hedge is unable to send out any shoots at all, and the utmost exertion of the vegetative powers enables it only to put forth leaves. These leaves are renewed in a sickly state for some years, and at last cease to grow at all-the branches become covered with fog, and the hedge perishes entirely. But if the soil be very rich, notwithstanding this great multiplication of the stems, the roots will still have sufficient vigor to force out a great many small shoots, which advance to a great length, but never attain a proportional thickness. And, as the vigor of the hedge makes them continue to vegetate very late in the autumn, the frosts come on before the tops of these dangling shoots have attained any degree of woody firmness, so that they are almost entirely killed by it: the whole hedge becomes covered with these long dead shoots, which are always disagreeable to look at, and usually indicate the approaching end of the hedge. The causes of the disorder being thus explained, it will readily occur, that the radical cure is amputation; which, by giving an opportunity to begin with training the hedge anew, gives also an opportunity of avoiding the errors that occasioned it. In this case care ought to be taken to cut the plants as close to the ground as possible, as there the stems will be less numerous than at any greater height. And particular attention ought to be had to allow very few shoots to arise from the stems that have been cut over, and to guard carefully against shortening them. But as the roots, in the case here supposed, will be very strong, the shoots that are allowed to spring from the stems will be very vigorous, and there will be some danger of their continuing to grow later in the season than they ought in safety to do; in which case, some part of the top of the shoot may perhaps be killed the first winter, which ought, if possible, to be prevented. This can only be effectually done by giving a check to the vegetation in autumn, so as to allow the young shoots to harden in the points before the winter approaches. If any of the 137

leaves or branches of a tree are cut away while it is in the state of vegetation, the whole plant feels the loss, and it suffers a temporary check in its growth in proportion to the loss that it thus sustains. To check, therefore, the vigorous vegetation at the end of autumn, it will be prusustains. dent to choose the beginning of September for the time of lopping off all the supernumerary branches from the young hedge, and for clipping off the side branches that have sprung out from it; which will, in general, be sufficient to give it such a check in its growth, at that season, as will prevent any of the shoots from advancing afterwards. If the hedge is extremely vigorous, a few buds may be allowed to grow upon the large stumps in the spring, with a view to be cut off at this season, which will tend to stop the vegetation of the hedge still more effectually. By this mode of management the hedge may be preserved entire through the first winter. And, as the shoots become less vigorous every successive season, there will be less difficulty in preserving them at any future period. It will always be proper, however, to trim the sides of a very vigorous hedge for some years while it is young, about the same season of the year, which will tend powerfully to prevent this malady. But, when the hedge has advanced to any considerable height, it will be equally proper to clip it during any of the winter months, before Candlemas.

HEDGE-BORN, adj. Hedge and born. ()f no known birth; meanly born.

He then, that is not furnished in this sort, Doth but usurp the sacred name of knight, And should, if I were worthy to be judge, Be quite degraded, like a hedge-born swain, That doth presume to boast of gentle blood.

Shakspeare.

HEDGE-CREEPER, n. s. liedge and creep. One that skulks under hedges for bad purposes.

HEDGE-HOG, n. s. Hedge and hog; crinaceus.

An animal with prickles, like thorns in a hedge.

Like hedge-hogs, which

Lie tumbling in my bare-foot way, and mount Their pricks at my foot-fall.

Shakspeare. Tempest.

Few have belief to swallow, or hope enough to experience, the collyrium of Albertus, that is to make one see in the dark : yet thus much, according to his receipt, will the right eye of an hedge-hog, boiled in oil, and preserved in a brazen vessel, effect. Browne's Vulgar Errours.

The hedge-hog hath his backside and flanks thick set with strong and sharp prickles; and besides, by the help of a muscle, can contract himself into a globular figure, and so withdraw his whole underpart, head, belly, and legs, within his thicket of prickles. Ray.

A term of reproach.

Did'st thou not kill this king?

-I grant ye.

-Do'st grant me, hedge-hog ? Shahspeare.

A plant; trefoil; medica echinata .-- Ainsworth.

The globe-fish ; orbis cchinatus.—Aiusworth.

HEDGE-HYSSOP, n.s. Hedge and hyssop. A species of willowwort ; gratiola.

Hedge-hyssop is a purging medicine, and a very rough one : externally it is said to be a vulnerary. Hill. Mat. Medica.

HEDGE-NOTE, n. s. Hedge and note. A word of contempt for low writing.

When they began to be somewhat better bred, they left these hedge-notes for another sort of poem, which was also full of pleasant raillery. Dryden.

HEDGE-PIG, n. s. Hedge and pig. A young hedge-hog. Thrice the brinded cat hath mewed,

Thrice and once the hedge-pig whined.

Shakspeare.

HEDGE-ROW, n. s. Hedge and row. The series of trees or bushes planted for enclosures. Sometime walking not unseen

By hedge-row elms, on hillocks green.

Milton. The fields in the northern side are divided by hedge-rows of myrtle. Berkley to Pope.

HEDGE-SPARROW, n. s. Hedge and sparrow; curruca. A sparrow that lives in bushes, distinguished from the sparrow that generally builds in thatch, or holes in walls.

The hedge-sparrow fed the cuckoo so long,

That it had its head bit off by its young.

Shakspeare.

HEDGING-BILL, n. s. Hedge and bill. A cutting-hook used in making hedges.

Comes master Dametas with a hedging-bill in his hand, chafing and swearing. Sidney.

HEDSJAS, one of the great divisions of modern Arabia, extends, in one vast plain, along the Red Sea from Mount Sinai to the frontier of It is sandy and very barren; but one Yemen. district yields the balm of Mecca: and there are some fruitful mountains behind. Except Jidda, there are few towns or villages of importance on the coast; and Hedsjas is chiefly remarkable for containing the famous capitals of MECCA and MEDINA; these have, however, a separate jurisdiction. See these articles. The highlands are possessed by a number of independent sheiks, but the Wahabees possess the general sovereignty.

HEDWIG (John), in biography, a botanist particularly celebrated for his discoveries relative to the fructification of mosses, and for a new and very ingenious generic distribution of them, the result of those discoveries, was born October 8th, 1730, at Cronstadt, in Transylvania, where his father filled a respectable station in the magistracy. He studied for four years at the public school of his native town On the death of his father in 1747, though he inherited but a very slender patrimony, he was enabled to go for further improvement to the university of Presburg in Hungary, where he remained two years, and then proceeded to Zittau in Upper Lusatia. In 1759 he took his degree of doctor of physic at Leipsic, on which occasion he published a thesis on the use of emetics in acute fevers, and was induced to establish himself at Chem nitz. The first and greatest fruit of Hedwig's labors, was the determination of the male and female flowers of mosses; the parts of which had been made out by Micheli, at least in a great measure, and even the true office of each sug-

gested; but the theory of the whole was first clearly detailed, as it was subsequently illustrated on every possible occasion, by Hedwig. Our author is recorded to have first beheld the bladder-like anther of the Linnæan Bryum pulvinatum, discharging its pollen, on the 17th of January 1770. He was already satisfied that what Linnæus, misled by Dillenius against his own previous opinion, had taken for anthers, were in fact the capsules of mosses, and produced real seed. A history of his discoveries was published in a German periodical work at Leipsic, in 1779. In 1782 appeared his valuable Fundamentum Historiæ Naturalis Muscorum Frondoscrum, a handsome Latin quarto, in two parts, with twenty colored microscopical plates. Hedwig lost his first wife in 1776; and, after marrying again ne in 1781 removed to Leipsic; and the following year the work above mentioned was there published, on which his fame as an original physiologist and botanist most securely rests. The same subject is happily followed up in his Theoria Generationis et Fructificationis Plantarum Cryptoga Micarum Linnæi, published at Petersburgh in 1784. The literary fame of Hedwig, and his medical practice, were now every day increasing; he was made physician to the town-guards, and professor of physic and of hotany at Leipsic. He lived to witness the general applause which his labors received, notwithstanding some attacks made on his theories of impregnation by Gærtner, Necker, and others. But he was not exempt from domestic afflictions. Of seven children brought him by his second wife six had died in their infancy; and the only remaining one, a favorite daughter, was taken from him at the age of sixteen, by a consumption. His grief, locked up in his own breast, could not be dissipated even by the scientific pursuits to which he wisely resorted for the occupation of his thoughts. His health declined ; a succession of feverish attacks impaired his constitution; and he died of a typhus, after nine days' confinement, on the 17th of February 1799, aged sixty-eight.

HEDÝPNOIS, from $\eta \delta v \varsigma$, sweet, and $\pi \nu \epsilon \omega$, to smell, is recorded by Pliny as a name sometimes given to the wild endive or succory. Class and order, syngenesia polygamia æqualis. Natural order, compositæ semiflosculosæ, Linn. cichoracez, Juss. Essential character; receptacle naked : CAL. with scales at the base; seed-crown of the disk double; the outermost obsolete, of many bristles: the inner of five chaffy scales: of the radius single, membranous and toothed. Species five; all natives of the south of Europe.

HEDYSARUM, French honey-suckle, a genus of the decandria order, and diadelphia class of plants; natural order thirty-second, papilionaceæ. The carina of the corolla is transversely obtuse; the seed-vessel a legumen with monospermous joints. There are above 120 species of this plant, of which the most remarkable are,

11. coronarium, the common biennial French honeysuckle, with large deeply striking bicnnial roots; upright, hollow, smooth, very branchy stalks, three or four feet high, garnished with pinnated leaves; and from between the leaves proceed long spikes of beautiful red flowers, succeeded by jointed seed-pods. It is easily raised from seed in any of the common borders, and is very ornamental.

H. gyrans, or sensitive hedysarum, a native of the East Indics, where it is called burrum chun-It arrives at the height of four feet, and dali. in autumn produces bunches of yellow flowers. The root is annual or biennial. It is a trifolious plant, and the la'eral leaves are smaller than those at the end, and all day long they are in constant motion without any external impulse. They move up and down and circularly. This last motion is performed by the twisting of the footstalks; and, while the one leaf is rising, its associate is generally descending. The motion downwards is quicker and more irregular than the motion upwards, which is steady and uniform. These motions are observable for twenty-four hours in the leaves of a branch which is lopped off from the shrub, if kept in water. If from any obstacle the motion is retarded, upon the removal of that obstacle it is resumed with a greater degree of velocity. This species requires the common culture of fender exotics.

HEED, v. a. & n. s.
HEED'FUL, adj.
HEED'FULLY, adv.
HEED'FULNESS, n. s.
HEED'ILY, adv.
HEED'INESS, n. s.

II

Sav. bedan; Swehad; Belg. hoede; Goth. hugad, from hug, the mind .--->Thomson. Attention and caution with reference to danger, HEED'LESSLY, adv. despecially as to HEED'LESSNESS, n. s. morals : but, in a

looser sense, regard; respect; caution; vigilance; care; observation: heedless is the opposite of all these.

Thou tokest noon hede, whils it shoon hoot;

Therfor wynter the nygheth, asay by thy cote. Chaucer. The Merchantes Second Tale. Take heed; have open eye; for thieves do foot by night;

Take heed ere Summer comes, or cuckoo birds affright.

Shakspeare. Merry Wives of Windsor.

Give him heedful note ;

For I mine eyes will rivet to his face;

And, after, we will both our judgments join,

In censure of his seeming. Id. Hamlet. Either wise bearing or ignorant carriage is caught

as men catch diseases, one of another; therefore, let men take heed of their company. Shakspeare. I am commanded

To tell the passion of my sovereign's heart ; Where fame, late ent'ring at his heedful ears, Hath placed thy beauty's image and thy virtue. Id.

To him one of the other twins was bound, Whilst I had been like heedful of the other.

Id.

Milton.

He did unseal them; and the first he viewed, He did it with a serious mind ; a heed

Id. Was in his countenance. Speech must come by hearing and learning; and birds give more heed, and mark words more than Bacon.

beasts. With wanton heed and giddy cunning, The melting voice through mazes running.

The heedless lover does not know

Whose eyes they are that wound him so. Waller.

We should take heed of the neglect or contempt of his worship. Tillotson.

Heedless of verse, and hopeless of the crown, Scarce half a wit, and more than half a clown. Dryden.

With pleasure Argus the musician heeds ; But wonders much at those new vocal reeds. Id.

It is a way of calling a man a fool, when no heed is given to what he says. L'Estrange.

Take heed that, in their tender years, ideas, that have no natural cohesion, come not to be united in their heads. Locke.

In the little harms they suffer from knocks and falls, they should not be pitied, but bid do so again ; which is a better way to cure their heedlessness. Id.

He will no more have clear ideas of all the operations of his mind, than he will have of all the particular ideas of any landscape or clock, who will not turn his eyes to it, and with attention heed all the parts of it. Id.

Some ideas, which have more than ence offered themselves to the senses, have yet been little taken notice of ; the mind being either heedless, as in childdren, or otherwise employed, as in men. Id.

Thou must take heed, my Portius?

The world has all its eyes on Cato's son.

Addison. Surprises are often fatal to heedless unguarded innocence. Sherlock.

Whilst ye discharge the duties of matrimony, ye Arbuthnot and Pope. heedlessly slide into sin.

Thou heedful of advice, secure proceed ;

My praise the precept is, be thine the decd.

Pope. Let the learner maintain an honourable opinion of his instructor, and heedfully listen to his instructions, as one willing to be led. Watts.

The tempest caught them on the tender walk, Heedless how far, and where its mazes strayed, While with each other blest, creative love Still bade eternal Eden smile around.

Thomson. Summer.

HEEL, n. s., v. n. & v. a. Sax. mere, itel; hal; Belg. hiel; HEEL'PIECE, n. s. & v. a. Goth. hala, the tail of an animal. A part of the foot; the whole foot; feet as employed in flight: to pursue as an enemy; to follow close as a dependent; to fetter or shackle: the back part of a stocking : heeler, a cock that strikes well with his heels: heel-piece, a piece fixed on the hinder part of the shoe, to supply what is worn away. To be at the heels is to pursue; to lay by the heels, to confine or overcome; to be out at heels, to be worn out or useless. Heel, to lean on one side, as the ship heels; to dance; to arm a cock for fighting.

In lusty leas at liberty I walk; And of these news these are not hele. Save that a clog doth hang yet at my heel. Wyatt And of these news I feel nor weal nor woe,

Id.

Sir, when comes your book forth?

Upon the heels of my presentment. Shakspeare. But is there no sequel at the heels of this

Mother's admiration? Id. Hamlet. A good man's fortune may grow out at heels.

Through proud London he came sighing on, Id. After the admired heels of Bolingbroke.

If the king blame mc for't, I'll lay ye all By the heels, and suddenly; and on your heads Clap round fines for neglect. Id.

I cannot sing,

Nor heel the high lavolt, nor sweeten talk.

The Spaniards fled on towards the north to seek their fortunes, being still chased by the English navy at their heels, until they were fain to give them over for want of powder. Bacon.

The stag recals his strength, his speed, His winged heels, and then his armed head, With these t' avoid, with that his fate to meet; But fear prevails, and bids him trust his feet.

Could we break our way

139

By force, and at our heels all hell should rise

With blackest insurrection, to confound

Heaven's purest light.

One half of man, his mind

Is sui juris, unconfined,

And cannot be laid by the heels. Hudibras. Nothing is commoner, in times of danger, than for

men to leave their masters to bears and tygers, and shew them a fair pair of heels for't. L'Estrange.

At the other side is a kind of heel or knob, to break clots with. Mortimer's Husbandry.

I began to smoke that they were a parcel of mummies; and wondered that none of the Middlesex justices took care to lay some of them by the heels.

Addison.

Denham.

Milton.

Pegasus appeared hanging off the side of a rock, with a fountain running from his heel. Id.

Some blamed Mrs. Bull for new heel-piecing her shoes. Arbuthnot.

If the luxated bone be distorted backward, it lieth over the heel bone. Wiseman's Surgery.

At his heels,

Close at his heels, a demagogue ascends, And with a dex'trous jerk soon twists him down, And wins them, but to lose them in his turn. Cowper.

Their culverins and so forth, would find way Through our friends armour there, with greater ease Than the adulterer's arrow through his heel Which Thetis had forgotten to baptize

In Styx. Byron. The Deformed Transformed.

HEFT, n.s. From heave; for HAFT, a handle, which see. Heaving; effort.

May be in the cup

A spider steeped, and one may drink ; depart, And yet partake no venom ; for his knowledge Is not infected : but if one present

The abhorred ingredient to his cyc, make known

How he hath drunk, he cracks his gorge, his sides Shakspeare. Winter's Tale. With violent hefts.

His oily side devours both blade and heft.

Waller.

HE'GIRA, n. s. Arabic. A term in chronology, signifying the epocha, or account of time, used by the Arabians and Turks, who begin their computation from the day that Mahomet was forced to make his escape from the city of Mecca, which happened on Friday, July 16th, A.D. 622, under the reign of the emperor Heraclius.

HEGIRA, from הגרח flight of, הגרח to fly; is the epocha from which the Mahommedans reckon time. To render this epocha more creditable, the Mahommedans affect to use the word hegira in a peculiar sense for an act of religion, whereby a man forsakes his country, and gives way to the violence of persecutors and enemies of the faith: they add, that the Corashites, being then the strongest party in the city, obliged their prophet to fly, as not being able to endure his abc-lishing of idolatry. This flight was not the first of Mahomet's, but it was the most famous. It

nappened in the fourteenth year from his assuming the character of prophet and apostle, and promulgating his new religion. The orientals do not agree with us as to the time of the hegira. Among the Mahommedans, Amasi fixes it to A. D. 630, and from the death of Moses 2347; and Ben Cassem to A. M. 5804: according to the Greek computation among the Christians, Said Ebn Batrick refers the hegira to A. D. 614, and A. M. 6113. Khondemir relates, that it was Omar, the second caliph, that first established the hegira as an epocha, and appointed the years to be numbered from it : at the time he made this decree, there were already seven years This establishment was made in imielapsed. tation of the Christians, who, in those times, reekoned their years from the persecution of Dioclesian. But there is another hegira, and that earlier too, though of less eminence. Mahomet, in the fourteenth year of his mission, was obliged to relinquish Medina; the Corashites had all along opposed him very vigorously, as an in-novator and disturber of the public peace; and many of his disciples, not enduring to be reputed followers of an impostor, desired leave of him to abandon the city, for fear of being obliged to renounce their religion. This retreat makes the first hegira. These two hegiras the Mahommedans, in their language, call hegiratan. The years of the hegira consist only of 354 days. To reduce these years to the Julian kalendar, i. e. to find what Julian year a given year of the hegira answers to, reduce the year of the hegira given into days, by multiplying by 354, divide the product by 365, and from the quotient subtract the intercalations, i. e. as many days as there are four years in the quotient; and lastly, to the remainder add 622.

HEIDEGGER (John Henry), professor of divinity at Zurich, was born in 1633. He published 1. Exercitationes Selectæ de Historia sacra Patriarcharum, 2 vols. 4to. 2. De Ratione Studiorum Opuscula Aurea, 12mo. 3. Tumulus Tridentini Concilii, 4to. 4. Historia Papatus, 4to.

HEIDEGGER (John James), a native of Zurich. in Switzerland, who long figured in England as Arbiter Elegantiarum, or manager of the public amusements. He was the son of a clergyman, and married, but left his country in consequence of an intrigue. In 1708, when he was nearly fifty years old, he came to England on a negociation from the Swiss at Zurich; but, failing in his embassy, he entered as a private soldier in the guards for protection. By his sprightly conversation, and insinuating address, he soon worked himself into the good graces of people of fashion, who called him the Swiss count. He procured a subscription, with which, in 1709, he was enabled to furnish out the opera of Thomyris, which was written in English, and performed at the queen's theatre in the Haymarket. The music, however, was Italian; that is to say, airs selected from sundry of the foreign operas by Buononeini, Searlatti, Steffani, Gasparini, and Heidegger, by this performance, Albinoni. gained 500 guineas. The judicious remarks he made on several defects in the conduct of our operas in general, and the hints he threw out for improving the entertainments of the royal theatre, soon established his character as a good critic. Appeals were made to his judgment; and some very magnificent and elegant decorations, introduced upon the stage in consequence of his advice, gave such satisfaction to George II., who was fond of operas, that, upon being informed to whose genius he was indebted for these improvements, he patronised him, and Heidegger soon obtained the chief management of the opera-house in the Haymarket. He then set about improving another species of diversion not less agreeable to the king, viz. the masquerades, and over these he always presided at the king's theatre. He was likewise appointed master of the revels. The nobility now favored him so much, that all splendid and elegant entertainments given upon particular occasions, and all private assemblies by subscription, were submitted to his direction. From the emoluments of these employments he gained a considerable income, amounting, in some years, to £5000, which he spent with much liberality, particularly in the maintenance of a luxurious table; so that it may be said he raised an income, but never a fortune. At the same time his charities ought not to pass unnoticed, which were frequent and ample. After a successful masquerade he has given away several hundred pounds at a time. 'You know poor objects of distress better than I do,' he would frequently say to a particular acquaintance, ' be so kind as to give away this money for me.' An amusing story is told respecting his conduct at the duke of Montagu's on one occasion. The facetious duke gave an entertainment to several of the nobility and gentry, when Heidegger was invited, and, in a few hours after dinner, so completely intoxicated, that he was carried out of the room, and laid insensible upon a bed. A Miss Salmon was now introduced, who took a mould from his face in plaster of Paris. From this a mask was made, and a few days before the next masquerade (at which the king promised to be present, with the countess of Yarmouth), the duke made application to Heidegger's valet de chambre, to know what suit of clothes he was likely to wear; and then, procuring a similar dress, and a person of the same stature, he gave him his instructions. On the evening of the masquerade, as soon as his majesty was seated, Heidegger as usual ordered the music to play ' God save the King;' but his back was no sooner turned, than the false Heidegger ordered them to strike up 'Over the water to Charley.' The whole company, and all the courtiers, not in the plot, were thunderstruck. Heidegger flew to the music-gallery, swore, stamped, and raved, accusing the musicians of drunkenness. The king and the countess laughed so immoderately, that they hazarded a discovery. While Heidegger staid in the gallery 'God save the king' was the tune; but when, after setting matters to rights, he retired to one of the dancing-rooms, to observe if decorum was kept by the company, the counterfeit stepping forwards, and placing himself upon the floor of the theatre, just in front of the musicgallery, called out in a most audible voice, imitating Heidegger, rated them for blockheadshad he not just told them to play ' Over the

water to Charley ?' A pause ensued; the musicians who knew his character, in their turn, thought him either drunk or mad; but as he continued his vociferation, 'Charley' was played again. At this repetition of the supposed affront, some of the officers of the guards, who always attended upon these occasions, were for ascending the gallery, and kicking the musicians out; but the late duke of Cumberland, who could hardly contain himself, interposed. The company were thrown into great confusion. 'Shame ! Shame !' resounded from all parts ; and Heidegger once more flew in a violent rage to that part of the theatre facing the gallery. Here the duke of Montagu, artfully addressing himself to him, told him, ' the king was in a violent passion; that his best way was to go instantly and make an apology, for certainly the musicians were mad, and afterwards to discharge them.' Almost at the same instant he ordered the false Heidegger to do the same. The scene now became truly comic in the circle before the king. Heidegger had no sooner made an humble apology for the insolence of his musicians, but the false Heidegger advanced, and, in a plaintive tone, cried out, Indeed, sire, it is not my fault, ' but that devil in my likeness.' Poor Heidegger turned round, stared, staggered, grew pale, and could not utter a word. The duke then humanely whispered in his ear the sum of his plot, and the counter-feit was ordered to take off his mask. Here ended the frolic; but Heidegger swore he would never attend any public amusement, if that witch the wax-work woman did not break the mould, and melt down the mask before his face. Heidegger was of so peculiar a visage, we may add, that he made a bet with lord Chesterfield, that he could not produce an uglier man throughout the metropolis, and won the wager. He died in 1749 at the advanced age of ninety years.

HEIDELBERG, a populous but ill built city of Germany, once the capital of the Lower Palatinate, but now belonging to Baden. It has a celebrated university, founded in 1386, and stands in a pleasant rich country, famous for the best Rhenish wine. It has, however, undergone many calamities. It was entirely burnt down in 1278, and 1288. In 1622 it was plundered by the Bavarians, and the rich library was transported partly to Vienna, and party to the Vatican. After this it enjoyed peace till 1689, when, the Protestant electoral house becoming extinct, a bloody war ensued, in which not only the castle was ruined, and the town burnt, but the tombs and bodies of the electors were shamefully violated and pillaged. This happened in 1693; and the people of the Palatinate were obliged to abandon their dwellings, and take refuge in foreign countries. The great tun, said to hold 600 hhds., was broken to pieces in 1693 by the French, but repaired at great expense in 1729. The public buildings worth notice are the townhouse, the three hospitals, several churches, and the university. The old fortress, Treutzkaiser, or Sternschanze, is also remarkable. The ancient electoral palace stands on a hill near the town, and is a fine ruin: its principal gate is ornamented with statues of the ancient electors and counts-palatine, as large as the life. The keep

and outer wall of the platform are entire; and a beautiful semicircular walk runs through an adjoining plantation. From the interior of this edifice there is a subterraneous passage to the great square in the town.

The foundation of a new library was laid here by the celebrated Grævius; and it had been gradually carried to 30,000 volumes, when, in 1815, the books and MSS. carried to Rome were restored. A liberal grant is now made to the university annually, and its reputation is increasing : a botanical garden has been lately attached to it. Besides the university there is an academy, and various other public and private schools. Several literary journals are published here, where also are held the periodical meetings of the Baden Protestant church. The manufactures, on a small scale, embrace woollens and cottons, silk stockings, tapestry, and paper. The environs are extremely beautiful. The town stands on the Neckar, over which is a stone bridge 790 feet in length : fourteen miles north-east of Spire, and ten S.S.E. of Manheim.

HEI'FER, n. s. Sax. bearore. A young cow.

Who finds the *heifcr* dead and bleeding fresh, And sees fast by a butcher with an axe,

But will suspect 'twas he that made the slaughter?

Shakspeare. A heifer will put up her nose, and snuff in the air against the rain. Bacon.

For her the flocks refuse the verdant food,

Nor thirsty heifer seck the gliding flood. Popc.

HEIGH Ho, *interj.* An expression of slight languor and uneasiness. It is used by Dryden, contrarily to custom, as a voice of exultation.

Heigh ho! an't be not four by the day, I'll be hanged. Shukspeare.

We'll toss off our ale 'till we cannot stand, And heigh ho for the honour of Old England.

Dryden.

HEIGHT, n.s. From IIIGH, which see. HEIGHT'EN, v. a. The simple idea of elevation used in a variety of ways; as, altitude; degrees of latitude; summit; rank; dignity; the utmost degree, or exertion; state of excellence; improvement by decorations or colors: to aggravate, or increase, or ameliorate.

Round was the shape, in manere of a compas Ful of degrees, the *hight* of sixty pas.

Chaucer. The Knightes Tale.

Come on, sir; I shall now put you to the height of your breeding. Shakspeare.

By him that raised me to this eareful height, From that contented hap which I enjoyed. Id.

There is in Ticinium a church that is in length one hundred feet, in breadth twenty, and in *height* near fifty. Bacon.

Putrefaction doth not rise to its height at once. Id.

Abroad I'll study thee,

As he removes far off, that great heights takes.

Of power, dominion, glory, wealth, and state.

Daniel.

Guinea lieth to the North sea, in the same height as Peru to the South. Abbott.

Ten kings had from the Norman conqueror reigned, When England to her greatest height attained,

Into what pit thou seest,	
From what height fallen.	Milton.
Did not she	
Of Timna first betray me, and reveal	
The secret, wrested from me in the heia	ht

Of nuptial love professed ? Id.

Hide me from the face

Of God, whom to behold was then my height Of happiness ! Id.

All beauty when at such a height

Is so already consecrate. Marvell. As in a room, contrived for state, the height of the roof should bear a proportion to the area; so in the heightenings of poetry, the strength and vehemence of figures should be suited to the occasion. Dryden. From Alpine heights the father first descends;

His daughter's husband in the plain attends. Id. Æneid.

An amphitheatre appeared,

Raised in degrees, to sixty paces reared : That when a man was placed in one degree, *Height* was allowed for him above to see.

a above to see.

Dryden.

An amphitheatre's amazing height Here fills the eye with terror and delight.

Addison. ocial duties are carried to greater heights, and enforced with stronger motives, by the principles of our religion. Id.

Foreign states used their endeavours to *heighten* our confusions, and plunge us into all the evils of a civil war. *Id.*

Despair is the *height* of madness. Sher.ock. Every man of learning need not enter into their difficulties, nor climb the *heights* to which some others have arrived. Watts.

Her robe along the gale profusely streamed, Light leaned the sceptre on her bending arm;

And round her brow a starry circlet gleamed, Height'ning the pride of each commanding charm.

Beattie.

It is the hush of night, and all between Thy margin and the mountains, dusk, yet clear, Mellowed and mingling, yet distinctly seen, Save darkened Jura, whose capt heights appear Precipitously steep. Byron. Childe Harold.

HEILBRONN, a town of Wirtemberg, on the Neckar, containing three churches, a well-endowed academy, and public baths. Its name signifies 'The Spring of Health,' derived from a fountain in the neighbourhood, once used medicinally, and which still supplies the town with water. It formerly had a commandery of the Teutonic order, and was the chief place of one of their provinces. The culture of the neighbouring vineyards, and the conveyance of goods by the Neckar, are the chief employment of the inhabitants. The only manufacturing establishment worth notice is an ingenious machine for the preparation of plaster of Paris. In 1810 Heilbronn became the capital of the department of the Lower Neckar. Twenty-five miles north of Stutgard.

ITEINECCIUS (John Gotlieb), a celebrated civilian of the eighteenth century, born at Eisenberg, in Altenburg, in 1681. After having studied at Goslar and Leipsic he became professor of philosophy at Halle in 1710; and in 1721 he was made professor of civil law, with the title of counsellor of the court. Ilis great reputation induced the states of Friesland to invite him to Francker in 1724; but in 1727 the king of Prussia prevailed on him to accept of a professorship of law at Frankfort on the Oder, where he distinguished himself till 1733. Becoming again professor at Halle, he remained there till his death in 1741, though invited to Marpurg, Denmark, and Holland. He wrote many works, all of them much esteemed. The principal are, 1. Antiquitatum Romanarum Jurisprudentiam Illustrantium Syntagma. This excellent abridgment gave rise to his reputation in foreign countries. 2. Elementa Juris Civilis. 3. Fundamenta Styli Cultioris. 4. Elementa Philosophiæ Rationalis et Moralis. 5. Ilistoria Juris Civilis Romani ac Germanici. 6. Elementa Juris Naturæ et Gentium, &c.

HEINECKEN, or HEINETKEN (Christian), an extraordinary child born at Lubeck in 1721. He spoke his maternal tongue fluently at ten months. At one year old he knew the principal events of the pentateuch; in two months more he was master of the entire history of the Old and New Testaments; at two years and a half he answered the principal questions in geography, and in ancient and modern history; and he spoke Latin and French with great facility before his fourth year. His constitution was so delicate, that he was not weaned till a few months before his death. M. Martini of Lubeck published a pamphlet in 1730, in which he endeavoured to give natural reasons for the extraordinary capacity of this child, who died in his fifth year.

HÉIN'OUS, adj. HEIN'OUSNESS, n. s. HEIN'OUSNESS, n. s. hate; or from the Teutonic hoon, shame. Atrocious; wicked in a high degree: atrociousness; wickedness; criminality; daring offence.

To abrogate or innovate the gospel of Christ, if men or angels should attempt, it were most *heinous* and accursed sacrilege. *Hooker*.

This is the man should do the bloody deed :

The image of a wicked heinous fault

Lives in his eye.

As it is a most *heinous*, so it is a most dangerous impiety to despise him that can destroy us.

Tillotson.

Shakspeare.

He who can treat offences provoking God, as jests and trifles, must have little sense of the *heinousness* of them. Rogers.

IIEINSIUS (Daniel), professor of politics and history at Leyden, and librarian to the university, was born at Ghent in 1580. He became a pupil of Joseph Scaliger at Leyden, and was greatly indebted to him for the eminence to which he attained in literature. He distinguished himself as a critic by his labors on many classical authors; and was highly honored at home and abroad. Gustavus Adolphus gave him a place among his counsellors of state; the republic of Venice made him a knight of the order of St. Mark; and pope Urban VIII. invited him to come, as he expressed it, 'to rescue Rome from barbarism.' He died in 1666, leaving several works both in poetry and prose. This great critic was lamentably attached to his bottle: his pupils, finding the door of the lecture-room closed one day, and suspecting the reason, are said to have written on it 'Heinsius non legit hodie, propter hesternam crapulam :' and one night, returning at a

142

Late hour towards his own house, in a zigzag direction, he had, we are told, sufficient command over his faculties to compose the following Latin verses :—

> Sta pes, sta bone pes, Aut hi lapides Mihi lectus erunt. Steady ! my feet—good feet be staid, Or else these stones will be my bed.

HEINSTUS (Nicholas), the son of Daniel, was born at Leyden; and became as great a Latin poet as his father, and a greater critic. His poems have been several times printed, but the best edition is that of Amsterdam in 1666. He gave editions of several of the classics, with notes; his Claudium is dedicated in a Latin poem to queen Christina of Sweden, and his Ovid to Thuanus. He died in 1681.

HEIR, n. s. & v. a. HEIR'ESS, n. s. HEIR'ESS, a. dj. HEIR'LESS, adj. HEIR'LESS,
heir; heiress: heirless, without an heir: heirship, the privilege of an heir. Heir-loom, from Sax. heir, and zzloma, goods. Any furniture or moveable decreed to descend by inheritance, and therefore inseparable from the freehold.

Being heirs together of the grace of life.

1 Pet. iii. 7.

Id

Id.

He was of knighthode and of fredome flour; Fortune him maked the *heir* of hir honour. *Chaucer. The Monhes Tale.*

God made marriage in Paradis, in the estate of innocencie, to multiplic mankinde to the service of God, and therefore is the breking thereof the more grevous; of which breking, come false heires, oft time that wrongfully occupien folkes heritages.

Id. The Persones Tale. I still think of

The wrong I did myself; which was so much, That *heirless* it hath made my kingdom.

Shakspzare.

What lady is that?

The heir of Alanson, Rosaline her name. Id. That I'll give my voice on Richard's side,

To bar my master's heirs in true descent,

God knows, I will not do it.

An heiress she, while yet alive ; All that was her's to him did give. Waller.

His son in blooming youth was snatched by fate,

One only daughter heired the royal state. Dryden. Æneas, though he married the heiress of the crown, yet claimed no title to it during the life of his father-

in-law. Id. An heir signifies the eldest, who is, by the laws of

England, to have all his father's land. Locke. A layman appoints an heir or an executor in his

will, to build an hospital within a year, under pain of being deprived of his heirship. Ayliffe's Par.

Sunk is the hero, and his glory lost, And 1 his heir in misery alone. Pope.

i misery atome.

The heirs to titles and large estates have a weakness in their eyes, and a tenderness in their constitution. Swift.

Achilles' sceptre was of wood,

Transmitted to the hero's line;

Thence through a long descent of kings

Came an heirloom, as Homer sings.

HEL

The young extravagant heir had got a new steward, and was resolved to look into his estate.

Swift.

What race of chiefs and heroes did she bear: What daughter of her beauties was the heir.

Byron. Childe Harold.

HEIR, in law, signifies the person who succeeds another by descent to lands, tenements, and hereditaments, being an estate of inheritance, or an estate in fee; because nothing passes by right of inheritance but in fee. See Consanguinity, Descent, Inheritance, Succession, and Law. If land be given to a man for ever, or to him and his assigns for ever, this vests in him but an estate for life. This very great nicety about the insertion of the word heirs in all feoffments and grants, in order to vest a fee, is plainly a relic of the feudal strictness, by which it was required that the form of the donation should be punctually pursued; or that, as Craig expresses it, in the words of Baldus, donationes sint stricti juris, ne quis plus donasse præsumatur quam in donatione expresserit. And therefore, as the personal abilities of the donee were originally supposed to be the only inducements to the gift, the donee's estate in the land extended only to his own person, and subsisted no longer than his life; unless the donor, by an express provision in the grant, gave it a longer continuance, and extended it also to his heirs. But this rule is now softened by many exceptions. For, 1. It does not extend to devises by will; in which, as they were introduced at the time when the feudal rigor was apace wearing out, a more liberal construction is allowed; and therefore, by a devise to a man for ever, or to one and his assigns for ever, or to one in fee-simple, the devisee has an estate of inheritance; for the intention of the devisor is suficiently plain from the words of perpetuity annexed, though he has omitted the legal words of inheritance. But if the devise be to a man and his assigns, without annexing words of perpetuity, there the devisee shall take only an estate for life; for it does not appear that the devisor in-tended any more. 2. Neither does this rule extend to fines or recoveries, considered as a species of conveyance; for thereby an estate in fee passes by act and operation of law without the word heirs; as it does also, for particular reasons, by certain other methods of conveyance which have relation to a former grant or estate, in which the word heirs was expressed. 3, In creations of nobility by writ, the peer so created has an inheritance in his title, without expressing the word heirs; for they are implied in the creation, unless it be otherwise specially provided : but in creations by patent, which are strictly juris, the word heirs must be inserted, otherwise there is no inheritance. 4. In grants of land to sole corporations and their successors, the word successor supplies the place of heirs; for, as heirs take from the ancestor, so does the successor from the predecessor. Nay, in a grant to a bishop or other sole spiritual corporation, in frank almoign, the words frank almoign supply the place of successors (as the word successors supplies the place of heirs) ex vi termini; and, in all these cases, a fee-simple vests in such sole corporation. But, in a grant of lands to a corporation aggregate, the word successors is not necessary, though usually inserted : for, although such simple grant be strictly only an estate for life, yet, as that corporation never dies, such estate for life is perpetual, or equivalent to a feesimple, and therefore the law allows it to be one. Lastly, in the case of the king, a fee-simple will vest in him, without the word heirs or successors in the grant; partly from prerogative royal, and partly from a reason similar to the last, because the king, in judgment of the law, never dies. But the general rule is, that the word heirs is necessary to create an estate of inheritance.

HEIR APPARENT is a person so called in the lifetime of his ancestor, at whose death he is heir at law.

HEIR PRESUMPTIVE is one who, if the ancestor should die immediately, would, in the present circumstances of things, be his heir; but whose right of inheritance may be defeated by some nearer heir being born.

HEIR-LOOM comprehends divers implements, as tables, presses, cupboards, bedsteads, furnaces, wainscot, and such like; which in some countries have belonged to a house for certain descents, and are never inventoried after the decease of the owner, as chattels are, but accrue by custom, not by common law, to the beir with the house itself. The ancient jewels of the erown are held to be heir-looms, and are not devisable by will, but descend to the next successor.

HEISTER (Laurence), a celebrated physician, surgeon, and anatomist, who also rendered himself conspicuous among botanists by his opposi-tion to the system and principles of Linnæus, at a time when they were making the greatest progress in the general estimation, was born at Frankfort on the Maine, in 1683. He was educated at several German universities, and in the year 1706 spent some time in the study of anatomy and surgery at Amsterdam under Ruysch, then so famous for his dissections and anatomical preparations. In the following year he went to serve as a surgeon in the Dutch camp in Brabant; devoting the subsequent winter to further improvement, under Boerhaave and his eminent colleagues, who at that time attracted students from all parts to the university of Leyden, where Heister took his degree. Returning afterwards to the camp, he was, in 1709, appointed physician general to the Dutch military hospital. The experience he thus acquired raised him to a distinguished rank in the theory and practice of surgery. In 1710 he became professor of anatomy and surgery at Altorf, in the little canton of Uri, and rendered himself celebrated by his lectures and writings. Ten years afterwards a more advantageous situation offered itself to him at Helmstadt, where he became physician to the duke of Brunswick, with the title of Aulic counsellor, as well as professor of medicine, and afterwards of surgery and botany, in that university. Here he continued till his death, which happened in 1758, at the age of seventy-five. In August, 1741, our author came forward as the professed adversary of Linnæus, in the inaugural dissertation of one of his pupils

named Goeckel, entitled Meditationes et Animadversiones in Novum Systema Botanicum sexuale Linnæi. Another dissertation of Heister's, published in October 1741, De Nominum Plantarum Mutatione utili ac noxia, is a more diffuse and elaborate attack on the nomenelature of the great Swedish teacher, whom however he terms 'a most diligent and most valuable botanist.' In 1748 he published a Systema Plantarum Generale ex Fructificatione, cui annectuntur regulæ ejusdem, de Nominibus Plantarum, a Celeb. Linnæi longè diversæ.

HEISTERIA, in botany, a genus of the monogynia order, and decandria class of plants; natural order twelfth, holoraceæ: CAL. quinquefid, the petals five: the fruit is a plum on a very large colored calyx. Species three; natives of different tropical countries.

different tropical countries. HEITERSHEIM, a town of Baden, on the borders of the Black Forest, long the residence of the grand prior of the order of St. John in Germany, who had a seat and a vote in the imperial diet. To this town, and its seven dependent villages, he added other possessions on the left bank of the Rhine : in 1806 the grand priory was suppressed. It is ten miles south of Brisac, and twenty N.N.E of Bale.

HELDER, or HELDER POINT, a town and fort of North Holland, opposite the Texel, seated on a cape on the coast of the Zuyder Zee, about twenty-four miles from Alkmaer. It was taken by the British, under the duke of York, August 30th, 1799, after a battle wherein about 1000 of the Dutch and 540 of the British were killed or wounded. It has a strong fort to defend the road of Mars Diep. Population about 2500. Near this place also Van Tromp fell in a naval action fought in 1653.

HELE (Thomas), a dramatic author of the eighteenth century, born in Gloucestershire in 1740. He acquired so complete a knowledge of the French language that he wrote it with all the ease and elegance of a native. After serving in the army during the German war, till the peace of 1763, he went to Italy, and thence to Paris; where he settled, and wrote comedies for the theatre which have been much admired. He died in 1780.

HELEN, or HELENA, in fabulous history, the daughter of Tyndarus, or, according to the poets, of Jupiter and Leda, was married to Menelaus king of Sparta, but was stolen from him by Theseus, A. A. C 1235. She was restored soon after; but carried off again by Paris, which occasioned the famous Trojan war. See PARIS and TROY.

HELENA (St.), the wife of the emperor Constantius Chlorus, and mother of Constantine the Great, was a native of South Britain; but authors differ as to the rank she held when the emperor married her. Dr. Watkins, in his Biographical Dictionary, makes her of 'obscure birth;' but Dr. Anderson, in his Royal Genealogies, says that she was the daughter of king Coilus II. In her eightieth year she went to the Holy Land, where, the Roman Catholies say, she discovered the holy cross. She died soon after, about A. D. 321. Helena (St.), an island of the South Atlantic Ocean, discovered by the Portuguese commander, J. Nova Gallega, on the festival of St. Helena in 1501. It is a mass of detached rock in the midst of the ocean, being about 1200 miles from the nearest point of land, in 15° 55' N. lat., and 5° 43' W. long.

The Portuguese stocked it with goats, fowl, fruit, and stores, for the refreshment of their ships bound to India; but soon neglected it, and at the close of the sixteenth century the Dutch obtained it with scarcely any resistance on the part of its discoverers. Afterwards, establishing a colony at the Cape of Good Hope, they also abandoned the island, and the East India Company settled on it in the same year, 1651; ten years after they obtained the possession of it by a charter from king Charles II. They now took pains in stocking and improving it; and the island, it is said, received a considerable supply of inhabitants in consequence of the fire of London. The Dutch, indeed, recovered it again in 1665, but, in less than twelve months, the English regained the possession. No fortifications seem to have been constructed here either by the Portuguese or Dutch. The first fort was a triangular redoubt, erected in 1665, called Fort James, in compliment to the duke of York, afterwards king James II. The appellation of James's Valley is derived from this fort, and that of Chapel Valley from the Portuguese chapel, the ruins of which were visible when the island was first settled by the English. The Dutch, recovered it again, but it was retaken by Sir Richard Munden, and, upon his arrival in England, the possession and government of it were again assigned by the king to the East India Company, and a charter was granted December 16th, 1673, constituting them lords proprietors of the island, with the rights and powers of sovereignty.

Thus it remained until in 1815 it was selected as the final abode of the deposed emperor Napoleon. It was in consequence ceded at this time to government; an act of parliament regulating the intercourse of ships with the island was passed; and a governor appointed having special charge of this important state prisoner, who died here the 5th of May, 1821. See NA-POLEON.

St. Helena is about ten miles and a half long, and six and three quarters broad, or about twentyeight miles in circuit. It rises abruptly from the sea, in vast masses varying from 600 to nearly 3000 feet in height : the whole coast being a perpendicular wall of solid rock, with four strongly fortified openings. The whole island, indeed, is but the summit of a mountain, and probably of volcanic origin. On entering the interior, however, the bleak appearance vanishes; verdant and beautiful small valleys occupy the interstices between the hills; and a plain, wholly free from large stones, extends about 1500 acres in an elevated part of the island. Here almost any grain or fruit will flourish. There is also another plain of about 200 acres, on a lower level; but the soil is impregnated with saline matter, and marine plants are its chief productions. Drana. Vor. XI. Diana's Peak, the loftiest summit of the

island, is about 2700 feet in height. In the southwest part there is another conspicuous conical hill called the High Knoll, but it is of inferior elevation. The shores present various rugged points and numerous caverns into which the sea breaks.

Its climate, from the elevation of the island, is mild, but moist, and remarkably uniform; so that at Plantation House, Fahrenheit's thermometer varies in the course of the year only from about 61° to 73°; at Longwood, which is still more elevated, it is generally 5° lower; while at James Town, it is about as much higher. Storms or hurricanes are rarely known: the trade winds blow steadily, but seldom to exceed a fresh breeze. The sky is, however, often enveloped in clouds. The quantity of rain that fell, in an average of four years, was 33.38 inches. Iron ore is said to be found in some parts of the island, and there are some appearances of gold and copper ore. Lime is plentiful and excellent. When first discovered St. Helena was covered with forests, but few traces of them now remain. Indeed the island is remarkably destitute of trees.

The scarcity of water is the principal impediment to the extension of agriculture, but this might probably be remedied by the planting timber on the hills. The oak of Europe has been introduced with success, and it is probable the teak of India would also succeed. Furze, the seeds of which were brought by the English, is tolerably abundant, and supplies the only fuel. The shrub called palma Christi seems indigenous to the island and can scarcely be rooted out; it has been supposed that it might be be made useful in the formation of hedges.

As a landing can only be effected on the lee side of the island, every accessible spot on that side is protected by fortifications, and the strictest military discipline has long been enforced throughout the island.

It possesses but one town on the north-west side, in James's Valley, which is entered from the shore by an arched gateway that leads into a parade of about 100 feet square. On the left is the government-house, or castle as it is sometimes called, and the principal guard-room. A handsome church is in front of this edifice, and a theatre on the right. The most respectable street extends from this part of the town, and contains about thirty houses. Two others branch from the upper part to the east and west; containing shops, well stored with European, and In-dian goods. The principal inhabitants have houses and plantations in the interior. Ships anchor in the road opposite the town. English families to the amount of 300 or 400 are often found here; the whole population being about 2000, one-half of whom, perhaps, are soldiers or slaves.

The annual expenses of the island to the East India Company, before the cession, amounted to from £40,000 to £50,000. The only revenue was in the quit rent and rent of lands leased, which amounted to £1000 a year, and the profit on the monopoly of arrack, which commonly produced £10,000. In 1809 the island contained 1811 sheep, and 2887 goats. The value of provisions furnished to ships amounted in 1789, to £6569; in 1809, to £6346. The quantity supplied at the latter period must have been little more than a third of that at the former, the prices of all the articles of produce having in that time nearly tripled. Beef and pork had risen from 6d. to 1s. 2d.; a sheep from $\pounds 1$ 1s. to $\pounds 2$ or $\pounds 3$; fowls from 1s. 6d. to 7s. 6d. On the shore of St. Helena there is produced a considerable quantity of the marine plant called salsola, which yields fine barilla.

HEL

Round the island are a number of small rocky islets surrounding it, the principal of which are called Egg, Speery, and George Islands. The rocks, as in most of the African Islands, consist in a great measure of basalt, of which there are excellent quarries.

HELENIUM, bastard sun-flower, a genus of the polygamia superflua order, and syngenesia class of plants, natural order forty-ninth, compositæ. The receptable is naked in the middle : under the radius paleaceous: the pappus consists of five short awns : CAL. is simple and multipartite : the florets of the radius semitrifid. The principal species are, H. autumnale, with spear-shaped narrow leaves: and, H. latifolium, with pointed, spear-shaped, sawed leaves. Both are natives of North America, where they grow wild in great plenty. They rise to the height of seven or eight feet in good ground. The roots, when large, send up a great number of stalks, which branch toward the top; the upper part of the stalk sustains one yellow flower, shaped like the sun-flower, but much smaller, having long rays, which are jagged pretty deep into four or five segments. These plants may be propagated by seeds, or by parting their roots; the latter is generally practised in this country. The best season to transplant and part the old roots is in October, when their leaves are past, or in the beginning of March, just before they begin to shoot. They delight in a soil rather moist than dry, provided it is not too strong, or does not hold the wet in winter.

HELEN'S (St.), a village, and road or bay in the Isle of Wight, on the northern coast. It is a place of rendezvous for the navy, and of great traffic in time of war. At the mouth of the bay is a cluster of rocks called the Mixen.

HELEN'S (St.), one of the Scilly Islands, about a mile north of Fresco, and containing the remains of one of the oldest churches in Britain. It comprises 100 acres of good soil, but is uninhabited.

HELENUS, a celebrated soothsayer, son of Priam and Hecuba. He was greatly respected by the Trojans. When Deiphobus was given in marriage to 11elen, in preference to himself, he retired to mount Ida, where Ulysses took him prisoner by the advice of Calchas. The Greeks, by threats and promises, induced him to reveal the secrets of the Trojans; and either the fear of death, or gratification of resentment, led him to disclose to the enemies of his country, that Troy could not be taken whilst it was in possession of the Palladium, nor before Philoctetes came from his retreat at Lemnos and assisted in the siege. After the ruin of his country, he fell to the share of Pyrrhus the son of Achilles, and saved his life by warning him to avoid a dangerous tempest, which proved fatal

to all those who set sail This endeared him to Pyrrhus; from whom he received Audromache, the widow of his brother Hector, by whom he had a son called Cestrinus. He was the only one of Priam's sons who survived the ruin of his country. After the death of Pyrrhus he reigned over part of Epirus, which he called Chaonia, in memory of his brother Chaon, whom he had inadvertently killed. Helenus received Æneas as he sailed towards Italy, and foretold him some of the calamities which attended his fleet.

HELEPOLIS, in the ancient art of war, a machine for battering down the walls of a place, the invention of which is ascribed to Demetrius Poliorcetes. Diodorus Siculus says, that each side of the Helepolis was 405 cubits in breadth, and ninety in height; that it had nine stages, and was carried on four strong solid wheels eight cubits in diameter; that it was armed with large battering rams, and had two roofs capable of supporting them; that in the lower stages there were different sorts of engines for casting stones; and in the middle they had large catapultas for discharging arrows, and smaller ones in those above, with a number of expert men for working these machines.

HELI'ACAL, adj. Fr. heliaque; from ήλιος. HE'LIACALLY, adv. S Emerging from the lustre of the sun, or falling into it.

Had they ascribed the heat of the season to this star, they would not have computed from its *heliacal* ascent. Browne.

From the rising of this star, not cosmically, that is, with the sun, but *heliacally*, that is, its emersion from the rays of the sun, the ancients computed their canicular days. Id.

He is tempestuous in the Summer, when he rises heliacally; and rainy in the Winter, when he rises achronically. Dryden.

HELIACAL, in astronomy, is applied to the rising and setting of the stars. A star is said to rise heliacally, when, after having been in con junction with the sun, and on that account invisible, it comes to be at such a distance from him as to be seen in the morning before sun-rising; the sun, by his apparent motion, receding from the star towards the east. The heliacal setting is when the sun approaches so near a star as to hide it with his beams, which prevent the fainter light of the star from being perceived; so that the terms apparition and occulation would be more proper than rising and setting.

HELIADES, in mythology, the daughters of Apollo and Clymene, who were so afflicted with the death of their brother Phaeton, that the gods, in compassion, transformed them into poplars on the banks of the Eridanus. Their names were Phaetusa, Lampetia, and Phœbe. See Phaeton.

HELIANTIIUS, the great sun-flower, a genus of the polygamia frustanea order, and syngenesia class of plants: natural order forty-ninth, compositæ. Receptacle is paleaceous and plane: pappus diphyllous: cAL. imbricated : the scales standing a little out at the tops. There are twenty-one species, most of which are now common in our gardens, though all of them are natives of America. They are all very hardy, and prosper in almost any soil or situation. They may be propagated either by seeds or by parting their roots.

HELIASTÆ, or HELIASTES, in antiquity, the judges of the court Heliæa. They were so called, according to Ulpian, from ' $\alpha\lambda\iota\zeta\omega$, to assemble in a great number; or, according to others, from $\eta\lambda \iota og$, the sun, because they held their assemblies in an open place, and from sun-rise to sun-They composed the most numerous and set. important of the Athenian tribunals. Their province was to explain obscure laws, and to give authority to those which had been violated. The Thesmothetæ convoked the assembly of the Heliastæ, which sometimes amounted to 1000, sometimes to 1500 judges. Mr. Blanchard is of opinion, that, to make this number, the Thesmothetæ sometimes summoned those of each tribe who had last quitted the public offices which they had exercised in another court. The assemblies of the Heliastæ were not frequent, as they would have interrupted the jurisdiction of the stated tribunals and the common course of affairs. The Thesmothetæ paid to each member of this assembly, for his attendance, three oboli. Hence Aristophanes terms them the brothers of the triobulus. They were fined if they came too late, and, if the orators had begun to speak, they were not admitted. They were paid out of the public treasury, and their pay was called misthos heliasticus. The assembly met at first, according to Aristophanes, at the rising of the sun. If the judges were obliged to meet under cover, on account of frost and snow, they had a fire; but no ancient author informs us of the place where these assemblies were held. We only learn, that there was a double enclosure around the assembly, that it might not be disturbed. The first was a kind of arbor work, separated by doors, over which were painted in red the first ten or twelve letters of the Greek alphabet, which directed the entrance of the officers who composed the tribunal, each of them entering under the letter which distinguished his tribe. The beadles, to whom they showed the wands which had been sent them by the Thesmothetæ, examined the mark, to see if it was authentic, and then introduced them. The second enclosure, which was twenty feet from the former, was a rope or cord; that the people who stood round the first enclosure, and were desirous to see what passed within the second, might not be prevented from gratifying their curiosity at a proper distance. Thus the attention of the judges was not interrupted by the concourse of the multitude, many of whom were heated by views of interest or of party. To each member were given two pieces of copper; one of which was perforated. Sea shells were at first in use. The king was present at the assembly, at whose command it had been summoned. The Thesmothetæ read the names of those who were to compose it, and each man took his place as he was called. The Thesmothetæ were then sent for, whose function it was to observe prodigies and to superintend the sacrifices ; and, if they gave their sanction, the deliberations were begun. The Exegetæ were often corrupted by those who were interested in the debates of the assembly, and even excited tumults. Of all the monuments extant, relating to the Heliastæ, the

most curious is the oath which those judges took before the Thesmothetæ: Demosthenes preserved it in his oration against Timocrates, who, having been bribed by those who had been intrusted with the effects taken on board a vessel of Naucratis, and refusing to give an account of them, had a law passed, by which an enlarge-ment was granted to prisoners for public debts on giving bail. Demosthenes, in making his oration against that law, ordered the oath of the Heliastæ to be read aloud, as a perpetual auxiliary to his arguments. This oath we quote, as it shows how important a tribunal that of the Heliastæ was:--'Í will judge according to the laws and decrees of the people of Athens, and of the senate of 500. I will never give my vote for the establishment of a tyrant, nor of an oligarchy. Nor will I ever give my approbation to any opinion prejudicial to the liberty or to the union of the people of Athens. I will not second those persons who may propose a reduction of private debts, or a distribution of the lands or houses of the Athenians. I will not recal exiles, nor endeavour to procure a pardon for those who shall be condemned to die; nor will I force those to retire whom the laws and the suffrages of the people shall permit to remain in their country. I will not give my vote to any candidate for a public function, who gives not an account of his conduct in the office which he has previously filled; nor will I presume to solicit any trust from the commonwealth without subjecting myself to this condition, which I intend as obligatory to the nine archons, to the chief of religious matters, to those who are ballotted on the same day with the nine archons, to the herald, the ambassador, and the other officers of their court. I will not suffer the same man to hold the same office twice, or to hold two offices in the same year. I will not accept any present, either myself or by another, either directly or indirectly, as a member of the Heliastic assembly. I solemnly declare that I am thirty years old. I will be equally attentive and impartial to the accuser and the accused; I will give my sentence rigorously according to evidence. Thus I swear, by Jupiter, by Neptune, and by Ceres, to act. And if I violate any of my engagements, I imprecate from these deities ruin on myself and my family; and I intreat them to grant me every kind of prosperity, if I am faithful to my oath.' Here we have one of the motives of the meeting of this assembly. Aristotle informs us of another; which was by the public authority deputed to them, to elect a magistrate in the room of one dead. It is surprising, that Pausanias, who enters so often into details, gives us no particular account of this assembly. All that he says of it is, that the most numerous of the Athenian assemblies was called Heliaa. Diogenes Lacrtius, in his life of Solon, says, that it was before one of these lleliastic assemblies, that Pisistratus presented himself, covered with wounds and contusions, to excite the indignation of the people against his pretended enemies. As to the manner in which the judges gave their suffrages, there was a sort of vessel covered with an osier mat, in which were placed two urns, the one of copper, the L^2

other of wood. In the lid of these urns was an oblong hole, large at the top, and narrower downwards. The suffrages which condemned the accused person were thrown into the wooden urn, called kyrios. That of copper, named akyros, received those which absolved him. Aristotle observes that Solon, whose aim was to make his people happy, and who found an aristocracy established by the election of the nine archons annual officers, whose power was almost absolute, tempered their sovereignty, by instituting the privilege of appealing from them to the people, who were to be assembled by lot to give their suffrages; after having taken the oath of the Heliastæ, in a place near the Panathenæum, where Hissus had, in former days, calmed a sedition of the people, and bound them to unanimity by an oath. It has likewise been remarked, that Apollo was not invoked in the oath of the Heliastæ, as in the oaths of the other judges. As all who took the oath of the Heliastæ, engaged not to he corrupted by solicitation or money, those who violated this part of their oath were condemned to pay a severe fine.

HEL'ICAL, adv. Fr. helice; from ἕλιζ. Spiral; with many circumvolutions.

The screw is a kind of wedge multiplied or continued by a *helical* revolution about a cylinder, receiving its motion not from any stroke, but from a vectis at one end of it. *Wilkins.*

HELICON, in ancient geography, a mountain in the neighbourhood of Parnassus and Cytheron, sacred to Apollo and the Muses. It is situated in Livadia, and now called Zagura or Zaguya. It was one of the most fertile and woody mountains in Greece. On it the fruit of the adrachnus, a species of the arbutus, or strawberry tree, was uncommonly sweet; and the inhabitants affirmed, that the plants and roots were all friendly to man, and that even the serpents had their poison weakened by the innoxious qualities of their food. Its north side was near Parnassus, where it touched on Phocis; and resembled that mountain in loftiness, extent, and magnitude. Here was the shady grove of the Muses and their images; with statues of Apollo and Bacchus, of Linus and Orpheus, and other illustrious poets. Among the tripods, in the second century, was that consecrated by Ilcsiod. On the left hand towards the grove was the fountain Aganippe; and about twenty stadia, or two miles and a half, higher up, the violet-colored Hippocrene. Round the grove were houses. A festival was celebrated there by the Thespians with games called musea. The valleys of Helicon are described by Wheeler as green and flowery in the spring; and enlivened by pleasing cascades and streams, and by fountains and wells of clear water. The Bœotian cities in general, two or three excepted, were reduced to inconsiderable villages in the time of Strabo. The grove of the Muses was plundered under Constantine the Great. The Heliconian goddesses were afterwards consumed in a fire at Constantinople, to which city they had been removed. See GREFCE.

IIELICONIA, in botany, a genus of the monogynia order, and pentandria class of plants.

The spatha is universal and partial; there is no calyx: cor. has three petals, and the nectarium two leaves: cars. is three-grained.

HELICTERES, the screw-tree: a genus of the decandria order, and gynandria class of plants; natural order thirty-seventh, columniferæ: cAL. monophyllous and oblique; petals five; and the nectarium consists of five petal-like leaflets; cAPS. intorted or twisted inwards. There are ten species, all natives of warm climates. They are shrubby plants, rising from five to fourteen feet in height, adorned with flowers of a yellow color. They are propagated by seeds; but are tender, and in this country must be kept in a stove during the winter.

HELIER (St.), the capital of the island of Jersey, in the bay of St. Aubin, where it has a harbour, and a stone pier, having the sea on the south-west and hills on the north. Another large hill projects over the town, and has a pleasant walk, and an extensive prospect. It is defended by Elizabeth Castle, a strong fortress on a rock in the bay, about a mile from the The streets are wide and well paved. town. The inhabitants are about 6500. In the market-place is a statue of George II. in bronze, gilt. St. Helier, within the last twenty years, has been greatly improved: it profited largely by the late war. When properly lighted it will vie with most of the market-towns in England. It contains within itself nearly one-third of the population, and within its port nearly the whole trade of the island. A work-house and a public hospital have been established here for the use of the whole island; and in 1815 a new prison was completed in the vicinity of the sea-shore. Elizabeth Castle is a strong fortress, on a rocky island in St. Aubin's Bay, about a mile from St. Helier, of which it defends the entrance; and another fortification has recently been constructed on a high hill which overhangs the town : it will contain from 2000 to 3000 men. It has also a small theatre and a public library. Three gazettes are published here weekly in French, and one in English. Packets sail three times a week to Weymouth. See JERSEY. Long. 2° 13' W., lat. 49° 13' N.

HELIGOLAND (Holy Island), a group of islands nearly equidistant, or twelve leagues, from the mouths of the Elbe, Weser, and Eyder; formerly belonging to Denmark, but now to Great Britain, which took possession of it from the former power in the war of 1807. The action of the waves has reduced the principal island to a great rock, from two to three miles in circuit rising in the centre to a round elevation, the ascent to which is by 150 steps. What little soil it possesses is sand and clay: the shores rise perpendicularly, and the island is surrounded by reefs and banks, the remains of its ancient territory. It has long been diminishing in this way. The elevated part is sometimes called the Cliff, and the other the Low Land. At a short distance is the Doun, or Douns, a distinct island, but ever varying its form. To the east is a road where ships may find forty-eight feet of water. The inhabitants of Heligoland, who amount to upwards of 2000, are descended from the ancient Frieslanders, whose language and marmers they

preserve; subsisting principally by fishing and pilotage. On the north end of the island is a light-house, and on the south a haven for boats.

Heligoland was in former ages the residence of a chief of the Sicambri, or North Frieslanders, and the seat of worship of the Saxon deity Phoseta. During the late war it was a considerable depôt for British merchandise, which was smuggled into the continent.

HELIOCARPUS, in botany, a genus of the digynia order, and dodecandria class of plants: natural order thirty-seventh, columniferæ: CAL. tetraphyllous* the petals four; the styles simple; CAPS. bilocular, compressed, and radiated lengthwise on each side.

HELIOCE'NTRIC, adj. Fr. heliocentrique ; ήλιος and κέντρον.

The heliocentrick place of a planet is said to be such as it would appear to us from the sun, if our eye were fixed in its centre. Harris.

HELIOCOMETES, a phenomenon sometimes observed about sun-setting; being a large luminous tail or column of light proceeding from the body of the sun, and dragging after it, like the tail of a comet, whence the name.

HE'LIOID PARABOLA, or the parabolic spiral, in mathematics, is a curve which arises from the supposition of the axis of the common Apollonian parabola being bent round into the periphery of a circle, and is a line then passing through the extremities of the ordinates, which do now converge towards the centre of the said circle.

HELIODORUS, bishop of Tricca, in Thessaly, and the father of romance writing, was born at Emmessa, in Phœnicia, in the end of the fourth century. In his youth he wrote a romance in ten books, the first work of its kind, entitled Æthiopics, relating the amours of Theagenes and Chariclea. He was deposed by a synod because he would not consent to suppress it. It has been repeatedly printed in Greek and Latin, particularly at Basil, in 1553. Professor Robison gives the following high character of this work, in his Proofs of a Conspiracy, p. 266. ' I think,' says he, ' that the first piece, in which woman is pictured as a respectable character, is the oldest novel that I am acquainted with, written by a Christian bishop, Heliodorus; I mean the adventures of Theagenes and Chariclea.' Ileliodorus was also a good Latin poet. He flourished under Theodosius I. and Arcadius.

HELIOGABALUS (M. Aurelius Antoninus), one of the many monsters who reigned in Rome. See ROME. He was murdered, after a short and detestable reign of four years, A. D. 222. He took the name of Heliogabalus from having been a priest of Apollo, in Phœnicia.

HELIOMETER, from $\eta\lambda \log$, the sun, and $\mu\epsilon\tau\rho\epsilon\omega$, to measure, an instrument called also astrometer, invented by M. Bouguer in 1747, for measuring with particular exactness the diameters of the stars, and especially those of the sun and moon. This instrument is a kind of telescope, consisting of two object glasses of equal focal distance, placed the one by the side of the other, so that the same eye glass serves for both. The tube is of a conic form, larger at the upper end, which receives the two object glasses,

than at the lower, which is furnished with an eye-glass and micrometer. By the construction of this instrument two distinct images of an object are formed in the focus of the eye-glass, whose distance, depending on that of the two object glasses from one another, may be measured with great accuracy; nor is it necessary that the whole disc of the sun or moon come within the field of view; since, if the images of only a small part of the disc be formed by each object-glass, the whole diameter may be easily computed by their position with respect to one another; for, if the object be large, the images will approach, or perhaps lie even over one another; and, the object-glasses being moveable, the two images may always be brought to touch one another, and the diameter may be computed from the known distance of the centres of the two glasses. Besides, as this instrument has a common micrometer in the focus of the eye-glass, when the two images of the sun or moon are made in part to cover one another, that part which is common to both the images may be measured with great exactness, as being viewed upon a ground that is only one-half less luminous than itself; whereas, in general, the heavenly bodies are viewed upon a dark ground, and on that account are imagined to be larger than they really are. By a small addition to this instrument, provided it be of a moderate length, M. Bouguer thought it very possible to measure angles of three or four degrees, which is of particular consequence in taking the distance of stars from the moon. With this instrument M. Bouguer, by repeated observation, found, that the sun's vertical diameter, though somewhat diminished by the astronomical refraction, is longer than the horizontal diameter; and, in ascertaining this phenomenon, he also found, that the upper and lower edges of the sun's disc are not so equally defined as the other parts; on this account his image appears somewhat extended in the vertical direction. This is owing to the decomposition of light, which is known to consist of rays differently refrangible in its passage through our atmosphere. Thus the blue and violet rays, which proceed from the upper part of the dise at the same time with those of other colors, are somewhat more refracted than the others, and therefore seem to us to have proceeded from a higher point; whereas, on the contrary, the red rays proceeding from the lower edge of the disc, being less refracted than the others, seem to proceed from a lower point; so that the vertical diameter is extended, or appears longer, than the horizontal diameter. Mr. Servington Savery discovered a similar method of improving the micrometer, which was communicated to the Royal Society in 1743. See MICROMETER.

HELIOPOLIS, a city of Egypt, so called by Herodotus and Diodorus Siculus; by Moses On, and by Jeremiah Bethshemesh. It is one of the most ancient cities of the world of which any vestiges can now be traced. It lay south-cast of the Delta, and cast of Memphis; and was long famous for its temple of the sun. The most enlightened philosophers of Greece and Rome were attracted to this celebrated seat of learning It was here that Herodotus became acquainted

with the sciences and mysteries of Egypt. Plato was here taught philosophy, and about thirty years before Christ its ruins were visited and described by Strabo. In this city was erected a temple to the sun, where a particular part was appropriated for the feeding of the sacred ox, which was here worshipped under the name of Mnevis. There was also another splendid temple, with avenues of sphinxes and superb obelisks, before the principal entrance. Out of the four obelisks, which were erected here by Sochis, two were carried to Rome; one was destroyed by the Arabs, and the fourth still remains. The obelisk, or pillar of On, which is now the only piece of antiquity that marks the site of Heliopolis, is about sixty-eight feet high, and six feet and a half wide on each side. According to Dr. Clarke, who has given a very correct engraving of it, it is one entire mass of reddish granite. Each of its four sides exhibits the same characters, and in the same order. Those which face the south have been the least affected by the decomposition of the substance of which they are hewn; and it is from the southern side that Dr. Clarke's engraving is taken. For a particular account of this obelisk, and the hieroglyphies which it contains, the reader is referred to Dr. Clarke's Travels in Egypt.—Near this city the French, under general Kleber, completely defeated the Turks under the grand vizier, and killed 8000 men, on the 18th of March, 1800, after the breach of the treaty of El-Arisch.

HELIOPOLIS, a city of Cœlesyria, near the springs of the Orontes; so called from the worship of the sun; now named Balbec. See BALBEC.

HE'LIOSCOPE, n. s. Fr. helioscope; ηλιος and σκοπέω. A sort of telescope fitted so as to look on the body of the sun, without offence to the eyes.

HĚ'LIOTROPE, n.s. Fr. heliotrope; $ij\lambda \log$ and $\tau_{\rho\ell}\pi\omega$; Lat. heliotropium. A plant that turns towards the sun; but more particularly the turnsol, or sunflower.

'Tis an observation of flatterers, that they are like the *heliotrope*; they open only towards the sun, but shut and contract themselves at night, and in cloudy weather. Government of the Tongue.

ILELIOTROPE, among the ancients, an instrument or machine for showing when the sun urrived at the tropics and the equinoctial line. This name was also used for a sun-dial.

HELIOTROPE, in lithology, a precious stone, of a green color, streaked with red veins. Pliny mys it is thus called, because, when cast into a vessel of water, the sun's rays falling thereon seem to be of a blood color; and that, when out of the water, it gives a faint reflection of the figure of the sun; and is proper to observe eclipses of the sun as a helioscope. The heliotrope is also called the oriental jasper, on account of its ruddy spots. It is found in the East Indies, as also in Ethiopia, Germany, Bohemia, &c. According to Brandes and Firnhaber it ontains, silica 96.55, oxide of iron 1.25, alutina 0.83, water $1.05, \pm 99.58$. It is found in rocks belonging to the secondary trap formation. The finest heliotrope comes from Bucharia and Siberia. A variety is found in the

island of Rume in Scotland. It is cut into seals and snuff-boxes. The Siberian wants the red spots.

¹ HELIOTROPIUM, turnsol, a genus of the polygynia order, and pentandria class of plants : natural order forty-first, asperifoliæ : cor. salvershaped and quinquefid, with smaller dents interjected alternately ; the throat closed up by small arches formed in the corolla itself. There are many species, all natives of warn countries. Only one, viz. II. tricoccum, grows in Europe, and is a native of France, Spain, and Italy.

HE'LISPHERICAL, adj. Helix and sphere. The *helispherical* line is the rhomb line in navigation, and is so called because on the globe it winds round the pole spirally, and still comes nearer and nearer to it, but cannot terminate in it. Harris.

HE'LIX, n. s. Fr. helice; Gr. art of a spiral line: a circumvolution.

Find the true inclination of the screw, together with the quantity of water which every *helix* does contain. *Wilkins*.

HELLX, in anatomy, is the whole circuit or extent of the auricle or border of the ear outwards; whence the inner protuberance surrounded thereby, and answering thereto, is called antihelix. See ANATOMY.

HELIX, in architecture. Some authors make a difference between the helix and the spiral. A stair-case, according to Daviler, is in a helix, or is helical, when the stairs or steps wind round a cylindrical newel; whereas the spiral winds round a cone, and is continually approaching nearer and nearer its axis. The word is also applied to the caulicules, or little volutes under the flowers of the Corinthian capital; called also urillæ.

HELIX, in zoology, the snail, a genus in the class of vermes, and order of testacea. The shell consists of one spiral, brittle, and almost diaphanous valve; and the aperture is narrow. There are numerous species, principally distinguished by the figure of their shells. They are of various sizes, from that of a small apple to less than a grain of corn. Some of them live on land, frequenting woods and gardens, or inhabiting clefts of rocks and dry sand-banks. Others are aquatic, inhabiting ponds, deep rivers, and the ocean. The principal species are,

1. H. hortensis, the garden snail, is in form like the pomatia, but less, and not umbilicated, clouded, or mottled with brown. It abounds with a viscid slimy juice, which it readily gives out by boiling in milk or water, so as to render them thick and glutinous. The decoctions in milk are apparently very nutritious and demulcent, and have been recommended in a thin acrimonious state of the humors, in consumptive cases, and emaciations. The eyes of snails are lodged in their horns, one at the end of each horn, which they can retract at pleasure. The manner of examining these eyes, which are four in number, is this: when the horns are out, cut off nimbly the extremity of one of them; and, placing it before the microscope, you may discover the black spot at the end to be really a semiglobular eye. The dissection of this animal is very curious; for the microscope not only discovers the heart beating just against the

round hole near the neck, which seems the place of respiration, but also the liver, spleen, stomach, and intestines, with the veins, arteries, mouth, and teeth, are plainly observable. The guts of this creature are green, from its eating herbs, and are branched all over with fine capillary white veins: the mouth is like a hare's or rabbit's, with four or six needle teeth, resembling those of leeches, and of a substance like horn. Snails are all hermaphrodites, having both sexes united in each individual. They lay their eggs with great care in the earth, and the young ones are hatched with shells completely formed. Cutting off a snail's head, a little stone appears, which is supposed to be a great diuretic, and good in all nephritic disorders. Immediately under this stone the heart is seen beating; and the auricles are evidently distinguishable, are membraneous, and of a white color; as are also the vessels which proceed from them. Snails discharge their excrements at a hole in their neck; they also breathe by this hole, and their parts of generation are situated very near it. Snails are said to couple three times at the distance of about fifteen days, which lasts ten or twelve hours. At the end of about eighteen days they bring forth their eggs by the aperture of their neck. The snail is a small animal; it is not free from the plague of supporting other smaller animals on its body; and as in other animals we find these secondary ones either living on their surface, as lice, &c., or in the intestines, as worms, it is very remarkable that this creature infests the snail in both these manners; being found sometimes on the surface of its body, and sometimes within its intestines. There is a part of the common garden snail, and of other of the like kinds, commonly called the collar. This surrounds the neck of the snail, and is considerably thick, and is the only part that is visible when the animal is retired quietly into its shell. In this state of the animal these insects which infest it are usually seen in considerable numbers marching about very nimbly on this part; besides, the snail, every time it has occasion to open its anus, gives them a place by which to enter into its intestines, and they often seize the opportunity. Snails are great destroyers of fruit in gardens, especially the better sorts of wall-fruit. Lime and ashes sprinkled on the ground where they most resort will drive them away, and destroy the young brood of them : it is a common practice to pull off the fruit they have bitten; but this should never be done, for they will eat no other till they have wholly eaten up this if it be left for them.

2. II. janthina, with a violet-colored shell. This is remarkable for the extreme thinness of texture, which breaks with the least pressure, and seems therefore entirely calculated to keep the open sea, or at least to shun rocky shores. It inhabits the seas of Europe, especially the Mcditerranean; those of Asia and Africa; and also the ocean. The living animal, when touched, exudes a juice which stains the hands of a violet color. Dr. Hawkesworth, in his account of Cook's voyage, mistakes this shell for that which yielded the purpura of the ancients. But whoever looks into Pliny cannot entertain the idea, that the thin shell aforementioned could be the same with it. They had several shells which yielded the purple dye; but these were all rock shells (see BUCCINUM, and MUREX), very different both in figure and hardness from the little helix janthina; which is not calculated for the neighbourhood of rocks.

3. H. pomatia, the exotic snail, with five spires, most remarkably ventricose, and fasciated with a lighter and deeper brown, is a native of France, where it inhabits the woods; but has been naturalised in England, where it inhabits the woods of the southern counties. It was introduced, as it is said, by Sir Kenelm Digby, whether for medical purposes, or as food, is uncertain: tradition says, that to cure his beloved wife of a decline, was the object. They are quite confined to our southern counties. An attempt was made to bring them into Northamptonshire, but they could not live there. They are used as food in several parts of Europe during Lent; and are preserved in an escargatoire, or a large place boarded in, with a floor covered half a foot deep with herbs, in which the snails nestle and fatten. They were also a favorite dish with the Romans, who had their cochlearia, a nursery similar to the above. Fulvius Hirpinus was the first inventor of this luxury, a little before the civil wars between Cæsar and Pompey. The snails were fed with sodden wine and bran. Its name is derived not from any thing relating to an orchard, but from $\pi\omega\mu a$, an operculum, it having a very strong one. This seems to be the species described by Pliny, lib. viii. c. 39, which he says was scarce; that it covered itself with the opercle, and lodged under ground; and that they were at first found only about the Maritime. Alps, and more lately near Velitræ.

HELL, n.s. Sax. bele; Teut. helle, signifying originally the grave; as some think, from Goth. hyla; Sax. belan, to cover, or conceal. The place of the devil and wicked spirits; the separate state, or invisible world; temporal death; the place at a running play to which those who are caught are carried; the place where the taylor throws his shreds; the infernal powers. By old writers it is a word used in composition.

I will go down to my son mourning to hell.

Genesis.

The pains of *hell* came about me; the snares of death overtook me. *Psa.* xviii. 4. He descended into *hell* Apado's Greed

He descended into hell. Apostle's Creed. Men shuld, eke, rembre hem of the shame

That is to come at the day of dome, to hem that hen Not penitent in this present lif; for all the creatures

In heven, and in erthe, and in helle, shul

See apertly all that they hidden in this world.

Chaucer. The Persones Tale.

For it is a knell

That summons thee to heaven, or to hell. Shakspeare.

If a man were a porter of *hell* gates, he should have o'd turning the key. *Id. Macbeth.*

Hell's black tyrant trembled to behold

The glorious light he forfeited of old. Couchy.

Let none admire That riches grow in hell; that soil may best Milton. Deserve the precious bane. In Covent-garden did a taylor dwell, Who might deserve a place in his own hell. King's Cookery.

This trusty squire, he had as well As the bold Trojan knight seen hell ; Not with a counterfeited pass Of golden bough, but true gold lace.

Hudibras.

152

O dire ambition ! what infernal power Unchained thee from thy native depth of hell, To stalk the earth with thy destructive train Murder and Lust! to waste domestic peace, And every heart-felt joy. Browne.

Then couples three be straight allotted there ; They of both ends the middle two do fly;

The two that in mid-place, hell called were, Must strive with waiting foot and watching eye,

To catch of them, and them to hell to bear, That they, as well as they, hell may supply. Sidney.

But some his royal service (fools !) disdain ; So down were flung :-- (oft bliss is double pain) In heaven, they scorned to serve, so now in hell they Fletcher's Purple Island. reign.

- by a power,

Deeper than all yet urged, a tyrant-spell, Which had its birth-place in a star condemned, The burning wreck of a demolished world, A wandering hell in the eternal space; By the strong curse which is upon my soul, The thought which is within me and around me, I do compel ye to my will.

Byron. Childe Harold.

HELL. The hell of the ancient heathens was divided into two mansions; the one called ELYSIUM, on the right hand, pleasant and delightful, appointed for the souls of good men; the other called TARTARUS, on the left, a region of misery and torment, appointed for the wicked. The latter only was hell, in the present restrained sense of the word. (See these articles). The philosophers were of opinion, that the infernal regions were at an equal distance from all the parts of the earth; nevertheless it was the opinion of some, that there were certain passages which led thither, as the river Lethe near the Syrtes, and the Acherusian cave in Epirus. At Ilermione it was thought that there was a very short way to hell; for which reason the people of that country never put the fare into the mouths of the dead to pay their passage. The Jews placed hell in the centre of the earth, and believed it to be situated under waters and mountains. According to them, there are three passages leading to it : the first is in the wilderness, and by that Korah, Dathan, and Abiram, descended into hell; the second in the sea, because Jonah, who was thrown into the sea, cried to God out of the belly of hell; the third is in Jerusalem, because it is said the fire of the Lord is in Zion, and his furnace is in Jerusalem. They likewise maintained seven degrees of pain in hell, because they find this place called by seven different names in scripture. Though they believed that infidels, and persons eminently wicked, will continue for ever in hell; yet they held, that every Jew who is not infected with some heresy, and has not acted contrary to

the points mentioned by the rabbies, will not be punished therein for any other crimes above a year at most.

The Mahommedans believe the eternity of rewards and punishments in another life. In the Koran it is said that hell has seven gates; the first for the Mussulmans, the second for the Christians, the third for the Jews, the fourth for the Sabians, the fifth for the Magians, the sixth for the Pagans, and the seventh for hypocrites of all religions. The locality of hell, and the reality of its fire, began first to be controverted by Origen. That father, interpreting the Scripture account metaphorically, makes hell to consist, not in external punishments, but in a consciousness or sense of guilt, and a remembrance of past pleasures. Among the moderns, Mr. Whiston advanced a new hypothesis. The comets, he thinks, are so many hells appointed in their orbits alternately to carry the damned into the confines of the sun, there to be scorched by its violent heat, and then to return with them beyond the orb of Saturn, to starve them in those cold and dismal regions. Another modern author supposes the sun to be the local hell. See Theology.

HELL, VALLEY OF, a valley of Suabia, in the Black Forest, through which, for many leagues, there is scarcely room for fifty men to march in front, the mountains rise so high on each side. Through this formidable defile, though defended by numerous bodies of Austrian troops, general Moreau, in 1798, forced a passage with his army, through a hostile country of 300 miles in extent : and daily gave battle to the Austrians, while flushed with victory; and even took several thousands of them prisoners, with many of their colors and cannons, during his desperate but masterly retreat, which many think has not been equalled since the days of Xenophon.

HELL'-BLACK, adj.
Hell'-BRED, adj.
HELL'-BROTH, n. s.
HELL'-NOOMED, adj.
Hell'-GOVERNED, adj.
Hell'-HATED, adj.
HELL'-HAUNTED, adj.
HELL'-HOUND, n. s.
HELL'-KITE, n. s.
HEL'LISH, adj.
HEL'LISHLY, adv.
HEL'LISHNESS, n. s.
HELL'WARD, adv.

Compounds now rarely used; their meaning is for the most part obvious: hell-broth, a composition boiled up for infernal purposes : hell-haunted, frequented by the devil: hell-hound, a dog or agent of hell: hellkite, a kite of the infernal breed : hellish,

any thing having the qualities of hell; infernal; diabolical; wicked: hellward, towards hell. The term hell prefixed to any word notes detestation.

Heart cannot think what courage and what cries, With foul enfouldered smoak and flashing fire, The hell-bred beast threw forth into the skies.

Spenser.

Adder's fork, and blind worm's sting, Lizard's leg, and owlet's wing; For a charm of powerful trouble, Like a hell-broth boil and bubble.

Shakspeare. Macbeth.

Did you say all? What all? Oh, hell-kite! all? What, all my pretty chickens, and their dam, Id. At one fell swoop?

Earth gape open wide and eat him quick, As thou dost swallow up this good king's blood, Which his *hell-governed* arm hath butchered. Shakspeare,

The sea, with such a storm as his bare head In hell-black night endured, would have boiled up,

And quenched the stelled fires. Id. King Lear. Back do I toss these treasons to thy head,

With the hell-hated lie o'erwhelm thy heart.

Shakspeare.

153

From forth the kennel of thy womb hath crept A hell-hound that doth hunt us all to death. Id.

And reckonest thou thyself with spirits of heaven, Hell-doomed.! and breathest defiance here and scorn, Where I reigned king? Milton.

Victory and triumph to the Son of God, Now entering his great duel, not of arms, But to vanquish by wisdom *hellish* wiles. Id. I called

My *hell-hounds* to lick up the draff, and filth, Which man's polluting sin with taint had shed On what was pure.

O thou celestial or infernal spirit of love, or what other heavenly or *hellish* title thou list to have, for effects of both I find in myself, have compassion of me. Sidney.

Now the *hell-hounds* with superior speed Had reached the dame, and, fastening on her side, The ground with issuing streams of purple dyed. Dryden.

Fierce Osmond closed me in the bleeding bark, And bid me stand exposed to the bleak winds, Bound to the fate of this *hell-haunted* grove. Id.

No benefits shall ever allay that diabolical rancour that ferments in some *hellish* breasts, but that it will foam out at its foul mouth in slander. South.

Be next thy care the sable sheep to place

Full o'er the pit, and hellward turn their face.

Pope.

HELL GATE, a strait near the west end of Long Island Sound, opposite to Harlem, in York Island, and about eight miles north-east of New York city, remarkable for its whirlpools, and a bed of rocks which extend quite across it. There is a sufficient depth of water for any vessel; but the passage of large ships can only be accomplished with the most skilful pilots.

HELLANICUS of Mitylene, a celebrated Greek historiau, born before Heredotus, flourished about A. A. C. 480. He wrote a history of the ancient kings and founders of cities, but it - has not come down to us.

IIELLAS, in ancient geography, an appellation comprising, according to the ancient Greeks and Romans, Achaia and Peloponnesus, but afterwards restrained to Achaia. It was bounded on the west by the Achelous, on the north by mounts Othrys and Octa, on the east by the Ægean Sea, and on the south by the Saronic and Corinthian Bays, and by the Isthmus which joins it to Peloponnesus. It was called Hellas from Hellen the son of Deucalion; and it is now called Livadia.

HELLE, in fabulous history, a daughter of Athamas, king of Thebes, by Nephele. She fled from her father's house with her brother Phryxus, to avoid the cruelty of her step-mother Ino. According to some, she was carried through the air on a ram with a golden fleece, which her mother had received from Neptune, and in her passage became giddy, and fell into that part of the sea which from her received the name of

Hellespont. Others say that she was carried or. a cloud, or rather upon a ship, from which she fell into the sea and was drowned. See PHRYXUS.

HEL'LEBORE, n. s. Lat. helleborus. Christmas flower.

HELLEBORE, BASTARD. See SERAPIAS.

Hellebore, Black. See Helleborus.

HEL'LEBORE, WHITE, n s. Lat. veratrum. A plant. See VERATRUM.

There are great doubts whether any of its species be the true *hellebore* of the ancients. Miller.

HELLEBORUS, HELLEBORE, a genus of the polygynia order, and pentandria class of plants: natural order twenty-sixth, multisiliquæ. CAL. none: petals five or more: the nectaria are bilabiated and tubular: CAPS. polyspermous, and a little erect. The most remarkable species is the

H. niger, black hellebore, or Christmas rose. It has roots composed of many thick fleshy spreading fibres, crowned by a large cluster of lobed leaves, consisting each of seven or eight obtuse fleshy lobes, united to one foot-stalk; and between the leaves several thick fleshy flowerstalks three or four inches high, surmounted by large beautiful white flowers of five roundish petals, and numerous filaments, appearing in winter, about or soon after Christmas. It may be propagated either by seeds or parting the roots. It prospers in open borders, or may be planted in pots to move when in bloom, in order to adorn any particular place; but it always flowers fairest and most abundantly in the front of a warm sunny border. The plants may be removed, and the roots divided for propagation, in September, October, or November; but the sooner in autumn it is done, the stronger will the plants flower at their proper season. The root was anciently used as a cathartic. The taste is acrid and bitter. Its acrimony is felt on the tip of the tongue, and then spreads itself immediately to the middle, without being much perceived in the intermediate part. On chewing the root for a few minutes, the tongue seems benumbed, and affected with a kind of paralytic stupor, as when burnt by eating any thing too hot. The fibres are more acrimonious than the head of the root from whence they issue. Black hellebore root, taken from fifteen to thirty grains, proves a strong cathartic; and, as such, has been celebrated for the cure of maniacal and other disorders proceeding from what the ancients called the atra bilis; in which cases, medicines of this kind are doubtless occasionally of use, though they are by no means possessed of any specific power. It does not however appear that our black hellebore acts with so much violence as that of the ancients; whence many have supposed it to be a different species of plant; and indeed the descriptions which the ancients have left us of their hellebore do not agree with those of any of the sorts usually taken notice of by modern botanists. Vauquelin ascribes its acrimony to a peculiar oil, which he separated from the infusion in alcohol, by distilling off the latter. It is very poisonous. Orfila says, on the contrary, that the poisonous quality of hellebore root resides in a principle soluble in water;

154

that the powdered root is more certainly fatal, when applied to a wound, than when swallowed; that the white hellebore is more active than the black; and that the alkaline extract, which forms a part of the tonic pills of Bacher, is also very powerful. Vomiting is the only antidote.

II. niger orientalis is a species discovered in the eastern countries, which Tournefort distinguishes thus : amplissimo folio, caule præalto, flore purpurescente, and he supposes it to be the true ancient hellebore, from its growing in plenty about mount Olympus, and in the island of Anticyra, celebrated of old for the production of this antimaniacal drug : he relates, that a scruple of this sort, given for a dose, occasioned convulsions.

HELLEN, the son of Deucalion, who is said to have given the name of Hellenus to the Greeks A Λ , C. 1521.

HEL'LENISM, n. s. 'E $\lambda\lambda\eta\nu\iota\sigma\mu\delta\varsigma$. A Greek idiom.

HELLENISM is only used when speaking of the authors who, writing in a different language, express themselves in a phraseology peculiar to the Greek.

HELLENISTIC LANGUAGE, that used by the Grecian Jews who lived in Egypt and other parts where the Greek tongue prevailed. In this language it is said the Septuagint was written, and also the books of the New Testament; and that it was thus denominated to show that it was Greek filled with Hebraisms and Syriacisms.

HELLENISTS, Hellenistæ, a term occurring in the Greek text of the New Testament, and which in the English version is rendered Grecians. The critics are divided as to the signification of the word. (Ecumenius, in his Scholia on Acts vi. 1, observes, that it is not to be understood as signifying those of the religion of the Greeks, but those who spoke Greek, $\tau \epsilon g$ $\epsilon \lambda \lambda \eta \nu \iota \tau \iota \phi \theta \epsilon \gamma \xi a \mu \epsilon \nu \epsilon g$. The authors of the Vulgate version, indeed, render it like ours, Græci ; but Messieurs Du Port Royal more accurately Juifs Grecs, Greek or Grecian Jews; the Jews who spoke Greek being here treated of, and hereby distinguished from the Jews called Hebrews, that is who spoke the Hebrew tongue of that time. These Hellenists, or Grecian Jews, were those who lived in Egypt and other parts where the Greek tongue prevailed. It is to them we owe the Greek version of the Old Testament commonly called the Septuagint, or that of the LXX. Salmasius and Vossius, however, are of a different opinion, with regard to the Hellenists. The latter will only have them to be those who adhered to the Grecian interests. Scaliger is represented, in the Scaligerana, as asserting the Hellenists to be the Jews who lived in Greece and other places, and who read the Greek Bible in their synagogues, and used the Greek language in sacris; and thus they were opposed to the Hebrew Jews, who performed their public worship in the Hebrew tongue. In this sense St. Paul speaks of himself as a Hebrew of the Hebrews (Phil. iii. 5.), i. e. a Hebrew both by na-tion and language. The Hellenists are thus properly distinguished from the Hellenes or Greeks, mentioned John xii. 20, who were Greeks by birth and nation, and yet proselytes to the Jewish religion.

HELLENODICÆ, 'Ελληνοδικαι, in antiquity the directors of the Olympian games. At first there was only one, afterwards the number increased to two and three, and at length to nine. They assembled in a place called 'EAAnvooikaiov, in the Elean forum, where they were obliged to reside ten months before the celebration of the games, to take care that such as offered themselves to contend, performed their $\pi \rho \circ \gamma v \mu \nu a \sigma \mu a \tau a$, or preparatory exercises; and to be instructed in all the laws of the games by certain men called νομοφυλακες, i. e. keepers of the laws. To prevent all unjust practices, they were obliged to take an oath, that they would act impartially, would take no bribes, nor discover the reason for which they disliked or approved of any of the contenders. At the solemnity they sat naked, having before them the victorial crown till the exercises were finished, and then it was presented to whomsoever they adjudged it. Nevertheless, there lay an appeal from the hellenodicæ to the Olympian senate.

HELLESPONT, a narrow strait between Asia and Europe, near the Propontis, so named from Helle. It is celebrated for the love and death of Leander, and for the bridge of boats which Xerxes built over it when he invaded Greece. It is now called the Dardanelles. It is about thirty-three miles long, and in the broadest parts the Asiatic coast is about one mile and a half distant from the European, and only half a mile in the narrowest, according to modern investigation.

HELM, n. s. & v.a. HELM'ED, adj. HEL'MET, n. s. defence; Berthelm eminent defence; like Amyntas and Boetius among the Greeks.—Gibson's

Canden. A covering for the head in war; a helmet; the part of a coat of arms that bears the crest; the upper part of the retort; the rudder of a vessel; the station of government; a steersman; to helm, to steer, guide, or conduct.

Of which every-first on a short truncheon His lordes *helmet* bore so richly dight, That the worst of hem was worth the ransoune

Of any king. Chaucer. The Floure and the Leafs. What so I spake, I ment it nought but wele,

By Mars the god that helmed is of stele.

Id. Troilus and Creseide.

More might be added of *helms*, crests, mantles, and supporters. *Camden's Remains*.

The very stream of his life, and the business he hath helmed, must give him a better proclamation. Shakspeare.

France spreads his banners in our noiseless land! With plumed *helm* the slayer begins his threats.

Id. I saw him down; thrice up again, and fighting; From helmet to the spur all bleeding o'er. Id.

You slander

The hclms o' the state, who care for you like fathers, When you curse them as enemics. Id.

They did not leave the *helm* in storms ; And such they are make happy states.

Ben Jonson.

More in prosperity is reason tost

Than ships in storms, their helms and anchors lost. Denham. The helmed cherubim

Are seen in glittering ranks with wings displayed. Milton.

With them arose

A forest huge of spears, and thronging *helms* Appeared, and serried shields in thick array Of depth immeasurable.

The vulgar chemists themselves pretend to be able, by repeated cohobations, and other fit operations, to make the distilled parts of a concrete bring its own caput mortuum over the *helm*. Boyle.

Seven darts are thrown at once, and some rebound From his bright shield, some on his *helmet* sound.

Dryden. Mnestheus lays hard load upon his helm. Id. Fair occasion shews the springing gale,

And interest guides the *helm*, and honour swells the sail *Prior*.

I may be wrong in the means; but that is no objection against the design : let those at the helm contrive it better. Swift.

Where my wrecked desponding thought

From wave to wave of fancied misery

At random drove, her helm of reason lost.

Young's Night Thoughts. Sense is our helmet, wit is but a plume,

The plume exposes, 'tis our helmet saves. Id.

The HELM, in nautical affairs, is a long and flat piece of timber, or an assemblage of several pieces, suspended along the hind part of a ship's stern-post, where it turns upon hinges to the right or left, serving to direct the course of the vessel, as the tail of a fish guides the body. The helm is usually composed of three parts, viz. the rudder, the tiller, and the wheel, except in small vessels, where the wheel is unnecessary. As to the form of the rudder, it becomes gradually broader in proportion to its distance from the top, or to its depth under the water. The back, or inner part of it, which joins to the stern-post, is diminished into the form of a wedge throughout its whole length, so as that the rudder may be more easily turned from one side to the other, where it makes an obtuse angle with the keel. It is supported upon hinges; of which those that are bolted round the stern-post to the after extremity of the ship, are called googings, and are furnished with a large hole in the after-part of the stern-post. The other parts of the hinges, which are bolted to the back of the rudder, are called pintles, being strong cylindrical pins, which enter into the googings, and rest upon them. The length and thickness of the rudder is nearly equal to that of the stern-post. The rudder is turned upon its hinges by means of a long bar of timber, called the tiller, which is fixed horizontally in its upper end within the vessel. The movements of the tiller to the right and left, accordingly, direct the efforts of the rudder to the government of the ship's course as she advances; which, in the sea language, is called steering. The operations of the tiller are guided and assisted by a sort of tackle, communicating with the ship's side, called the tillerrope, which is usually composed of untarred rope-yarns, for the purpose of traversing more readily through the blocks or pulleys.

To facilitate the management of the helm, the tiller-rope, in all large vessels, is wound about a wheel, which acts upon it with the powers of a crane or windlass. The rope employed in this service being conveyed from the fore-end of the tiller to a single block on each side of the ship, is farther communicated to the wheel, by two blocks suspended near the mizen-mast, and two holes immediately above, leading up to the wheel, which is fixed upon an axis on the quarter-deck, almost perpendicularly over the foreend of the tiller. Five turns of the tiller-rope are usually wound about the barrel of the wheel; and, when the helm is amidship, the middle turn is nailed to the top of the barrel, with a mark by which the helmsman readily discovers the situation of the helm, as the wheel turns it from the starboard to the larboard side. The spokes of the wheel generally reach about eight inches beyond the rim or circumference, serving as handles to the person who steers the vessel. As the effect of a lever increases in proportion to the length of its arm, it is evident that the power of the helmsman to turn the wheel will be increased according to the length of the spokes beyond the circumference of the barrel. When the helm, instead of lying in a right line with the keel, is turned to one side or the other, it receives an immediate shock from the water, which glides along the ship's bottom in running aft, and this fluid pushes it towards the opposite side, whilst it is retained in this position: so that the stern, to which the rudder is confined, receives the same impression, and accordingly turns about whilst the head of the ship passes in the opposite direction. It must be observed, that the current of water falls upon the rudder obliquely, and only strikes it with that part of its motion which acts according to the sine of incidence, pushing it with a force which not only depends on the velocity of the ship's course, by which this current of water is produced, but also upon the extent of the sine of incidence. This force is by consequence composed of the square of the velocity with which the ship advances, and the square of the sine of incidence, which will necessarily be greater or smaller according to circumstances; so that if the vessel runs three or four times more swiftly, the absolute shock of the water upon the rudder will be nine or sixteen times stronger under the same incidence : and if the incidence is increased, it will yet be augmented in a greater proportion, because the square of the sine of incidence is more enlarged. This impression, or power of the helm, is always very feeble, when compared with the weight of the vessel; but, as it operates with the force of a long lever, its efforts to turn the ship are extremely advantageous. For the helm being applied to a great distance from the centre of gravity, or from the point about which the vessel turns horizontally, if the direction of the impression of the water upon the rudder be prolonged, it is evident that it will pass widely distant from the centre of gravity: thus the absolute effort of the water is very powerful. It is not therefore surprising, that this machine impresses the ship with a considerable circular movement; and even much farther whilst she sails with rapidity, because the effect of the helm always keeps pace with the velocity with which the vessel advances. Amongst the several angles that the rudder makes

with the keel, there is always one position more

favorable than any of the others, as it more readily produces the desired effect of turning the ship, in order to change her course.

Geometricians have determined the most advantageous angle made by the helm with the line prolonged from the keel, and fixed it at 54° 44', presuming that the ship is as narrow at her floating line, or at the line described by the surface of the water round her bottom, as at the keel. But as this supposition is absolutely false, inasmuch as all vessels augment their breadth from the keel upward to the extreme breadth, where the floating-line or the highest water-line is terminated; it follows, that this angle is too large by a certain number of degrees. For the rudder is impressed by the water, at the height of the floating-line, more directly than at the keel, because the fluid exactly follows the horizontal outlines of the bottom; so that a particular position of the helm might be supposed necessary for each different incidence which it encounters from the keel upwards. But, as a middle position may be between all these points, it will be sufficient to consider the angle formed by the sides of the ship, and her axis, or the middle line of her length, at the surface of the water, in order to determine afterwards the mean point, and the mean angle of incidence. It is evident that the angle 54° 44' is too open, and very unfavorable to the ship's headway, because the water acts upon the rudder there with too great a sine of incidence, as being equal to that of the angle which it makes with the line prolonged from the keel below: but above, the shock of the water is almost perpendicular to the rudder, because of the breadth of the bottom, as we have already remarked. If then the rudder is only opposed to the fluid, by making an angle of 45° with the line prolonged from the keel, the impression, by becoming weaker, will be less opposed to the ship's head-way; and the direction of the absolute effort of the water upon the helm, drawing nearer to the lateral perpendicular, will be placed more advantageously, for the reasons above mentioned. On the other hand, experience daily testifies, that a ship steers well when the rudder makes the angle equal to 35° only. -It has been already remarked, that the effect of moving the wheel to govern the helm increases in proportion to the length of the spokes; and so great is the power of the wheel, that, if the helmsman employs a force upon its spokes equivalent to thirty pounds, it will produce an ef-fect of ninety or 120 lbs. upon the tiller. On the contrary, the action of the water is collected into the middle of the breadth of the rudder, which is very narrow in comparison with the length of the tiller; so the effort of the water is very little removed from the fulcrum upon which it turns ; whereas the tiller forms the arm of a lever ten or fifteen times longer, which also increases the power of the helmsman in the same proportion that the tiller bears to the lever upon which the impulse of the water is directed. This force then is by consequence ten or fifteen times stronger; and the effort of 30 lbs., which at first gave the helmsman a power equal to 90 lbs. or 120 lbs. becomes accumulated to one of 900 lbs. or 1800 lbs. upon the rudder. This disadvantage

then arises from the shortness of the lever upon which the action of the water is impressed, and the great comparative length of the tiller, or lever, by which the rudder is governed; together with the additional power of the wheel that directs the movements of the tiller, and still farther accumulates the power of the helmsman over it. Such a demonstration ought to remove the surprise with which the prodigious effect of the helm is sometimes considered, from an inattention to its mechanism : for we need only to observe the pressure of the water, which acts at a great distance from the centre of gravity, about which the ship & supposed to turn, and we shall easily perceive the difference there is between the effort of the water against the helmsman, and the effect of the same impulse against the vessel. With regard to the person who steers, the water acts only with the arm of a very short lever : or: the contrary, with regard to the ship, the force of the water acts upon a very long lever, which renders the action of the rudder extremely powerful in turning the vessel; so that, in a large ship, the rudder receives a shock from the water of 2700 lbs. or 2800 lbs., which is frequently the case when she sails at the rate of three or four leagues by the hour; and this force, being applied perhaps 100 or 110 feet distant from the centre of gravity, will operate upon the ship to turn her about, with 270,000 lbs. or 308,000 lbs.; whilst, in the latter case, the helmsman acts with an effort which exceeds not 30 lbs. upon the spokes of the wheel. From what has been said, it is plain that the more a ship increases her velocity, with regard to the sea, the more powerful will be the effect of the rudder; because it acts against the water with a force which increases as the square of the swiftness of the fluid, whether the ship advances or retreats.

The HELMET was anciently worn by horsemen both in war and in tournaments. It covered both the head and face, only leaving an aperture in the front secured by bars, which was called the visor. See ARMOUR. In achievements it is placed above the escutcheon for the principal ornament, and is the true mark of chivalry and nobility. Helmets vary according to the different degrees of those who bear them. They are also used as a bearing in coats of arms. See HE-RALDRY.

HELMI'NTIHC, adj. From ἕλμινθος. Relating to worms.

HELMINTHOLITHUS, in natural history, a name given by Linnæus to petrified bodies resembling worms.

HELMONT (John Baptist Van), a celebrated Flemish gentleman, born at Brussels in 1577. He acquired such skill in natural philosophy, physic, and chemistry, that he was accounted a magician, and thrown into the inquisition : but, having with difficulty justified himself, as soon as he was released he retired to Holland; where he died in 1644. He published 1. De Magnetica Corporum Curatione. 2. Febrium Doctrina Inaudita. 3. Ortus Medicinæ. 4. Paradoxa de aquis Spadanis : and other works, printed together in 1 vol. folio.

HELOISE, or ELOISA, the mistress and afterwards the wife of Abelard, famous for her Latin

letters to him, after they had retired from the world. She died abbess of Paraclete in 1163. See ABELARD.

HELONIAS, in botany, a genus of the trigynia order and hexandria class of plants; natural order tenth, coronariæ: con. hexapetalous: CAL. none: CAPS. trilocular.

HELOS, in ancient geography, a maritime town of Laconia, between Trinasus and Acriæ, in the district of Helotea. In Pausanias's time it was in ruins. The people, being subdued by the Lacedæmonians, were all reduced to a state of the most abject slavery. Hence the term aλωτευειν, in Harpocration, for being in a state of slavery; and hence also the Lacedæmonians called the slaves of all nations whatever helotes. Heloticus is the epithet.

HELOTÆ, HELOTES, or HELOTS, called also Helei and Heleatæ by Stephanus, and Ilotæ by Livy, the inhabitants of Helos and the slaves of the Spartans. See HELOS. The Spartans were forbidden the exercise of any mean or mechanical employment, and therefore the whole care of supplying the city with necessaries devolved upon the Helots. These Helots farmed the lands of the Spartans; and, in order to attach them to the service of their masters by the allurement of gain, they only paid a fixed rent, inferior to the produce, and which it would be disgraceful in any proprieter of land to advance. They were also skilful in mechanics: in time of war they served as sailors on board the fleet; and in the army every oplites, or heavy armed soldier, was accompanied by one or more of them.

HELP, v. a., v. n. & n. s.	Preter. helped, or
HELP'ER, n. s.	holp; part. helped,
HELP'FUL, adj.	or holpen. Saxon
HELP'LESS, adj.	pelpan; Goth. hil-
HELP'LESSLY, adv.	pan; Gr. $o\phi \in \lambda \lambda \omega$.
HEID'IDSENDSS m. C	The idea of com-

municating to the advantage of another is common to all these words : as to assist, support, relieve, prevent, avoid; to promote or forward; to supply to, or furnish with, and to present at table: it is used with other words expressive of its particular meaning, as to help up, help out, help over, help off: help is aid, assistance, remedy: a helper is the agent: helpful, useful, wholesome, salutary: helpless, wanting power or aid; irremediable.

But who shal helpen me nowe to complaine, Or who shal nowe my life gie or lede? O Niobe ! let nowe thy teres rayne

Into my penne, and helpe me eke in need. Chaucer. Complaint of the Blacke Knight.

Mariage is a ful gret sacrament ;

He which that hath no wif I hold him shent;

He liveth helples, and all desolat :

(I speke of folke in secular estat),

And herkeneth why; I say not this for nought, That woman is for mannes helpe ywrought.

Id. The Mcrchantes Tale.

I know how to deceive myself withouten help, And how the lion chastised is, by beating of the whelp. Earl of Surrey.

Such helpless harms it's better hidden keep, Than rip up grief, where it may not avail. Spenser.

Muleasses, despairing to recover the city, hardly escaped his enemies' hands by the good help of his uncle. Knolles.

Heaven

157

Hath brought me up to be your daughter's dower, As it hath fated her to be my motive,

And helper to a husband. Shakspeare. Let's fight with gentle words,

Till time lend friends, and friends their helpful swords. Id.

Sir, how comes it you

Have holp to make this rescue ?

Cease to lament for that thou can'st not help ;

And study help for that which thou lamentest. Id. Love doth to her eyes repair, Id.

To help him of his blindness.

A skilful chymist can as well, by separation of visible elements, draw helpful medicines out of poison, as poison out of the most healthful herbs.

Raleigh.

Id.

If you make the earth narrower at the bottom than at the top, in fashion of a sugar-loaf reversed, it will help the experiment. Bacon.

Coral is in use as an help to the teeth of children. Id.

Discreet followers and servants help much to reputation. Id.

Let us work as valiant men behoves;

For boldest hearts good fortune helpeth out.

Fairfax.

It is impossible for that man to despair who remembers that his helper is omnipotent.

Taylor's Rule of Holy Living.

Though these contrivances increase the power, yet they proportionably protract the time; that which by such helps one man may do in a hundred days, may be done by the immediate strength of a hundred men in one day. Wilkins.

Compassion, the mother of Tears, is not always a mere idle spectator, but an helper oftentimes of evils. More.

There is no help for it, but he must be taught accordingly to comply with the faulty way of writing. Holder on Speech.

A man reads his prayers out of a book, as a means to help his understanding and direct his expressions.

Stillingfleet.

Bennet's grave look was a pretence,

And Danby's matchless impudence

Helped to support the knave. Dryden. One dire shot

Close by the board the prince's main-mast bore ; All three now helpless by each other lie. Id.

This he conceives not hard to bring about, Id. If all of you should join to help him out.

Those closing skies may still continue bright ; But who can help it, if you make it night. Id. She, betwixt her modesty and pride,

Her wishes, which she could not help, would hide. Id.

He orders all the succours which they bring; The helpful and the good about him run, And form an army. Id.

Naked he lies and ready to expire, Helpless of all that human wants require.

Id. The man that is now with Tiresias, can help him to his oxen again. L'Estrange.

It is a high point of ill nature to make sport with any man's imperfections that he cannot help. Id.

Having never learned any laudable manual art, they have recourse to those foolish or ill ways in use, Locke. to help off their time.

He may be beholden to experience and acquired notions, where he thinks he has not the least help Id. from them.

Help and ease them, but by uo means bemoan Id. them.

158

Another help St. Paul himself affords us towards the attaining the true meaning contained in his epistles. Id.

Virtue is a friend and an help to nature; but it is vice and luxury that destroys it, and the diseases of intemperance are the natural product of the sins of intemperance. The God of learning and of light, South.

Would want a God himself to help him out.

Swift.

I live in the corner of a vast unfurnished house : my family consists of a steward, a groom, a helper in the stable, a footman, and an old maid. Id.

Those few who reside among us, only because they Id. cannot *help* it.

Some, wanting the talent to write, made it their care that the actors should help out where the muses Rymer. failed.

A generous present helps to persuade as well as an agreeable person. Garth.

So great is the stupidity of some of those, that they may have no sense of the help administered to them. Smalridge.

What I offer is so far from doing any diskindness to the cause these gentlemen are engaged in, that it does them a real service, and helps them out with the main thing whereat they stuck. Woodward.

Let our enemies rage and persecute the poor and the helpless; but let it be our glory to be pure and peaceable. Rogers.

He cannot help believing, that such things he saw Atterbury. and heard.

In that dread moment, how the frantic soul Raves round the walls of her clay tenement,

Runs to each avenue and shrieks for help,

Blair's Grave. But shrieks in vain. In plenty starving, tantalized in state,

And complaisantly helped to all I hate ;

Treated, caressed, and tired, I take my leave.

Pope.

I cannot help remarking the resemblance betwixt him and our author in qualities, fame, and fortune. Id.

How shall I then your helpless fame defend? "Twill then be infamy to seem your friend. Id. At evening to the setting sun he turns

A mournful eye, and down his dying heart

Thomson's Seasons. Sinks helpless.

If they take offence when we give none, it is a thing we cannot help, and therefore the whole blame must lie upon them. Sanders.

I mean the man who, when the distant poor Need help, denies them nothing but his name.

Cowper's Task.

And he had learned to love,-I know not why, For this, in such as him, seems strange of mood,-The helpless looks of blooming infancy,

Even in its earliest nurture. Byron. Childe Harold.

HELSINGFORS, a town and naval station in the south of Finland, at the mouth of the Wanna. It has a very good harbour, and 3200 inhabitants; who carry on a trade in corn, fish, logs, and deals: the latter articles being exported sometimes to the Mediterranean. It is defended by several forts, the principal of which is Sweaborg. It was built by Gustavus I., but burnt down in 1741 by the Russians : who, however, now have much encouraged it. It is 104 miles S.S.E. of Abo.

HELSINGIA, or HELSINGLAND, a province of Sweden, bounded on the north by Jempterland and Medalpadia, on the east by the Bothnian Gulf, on the south by Gestricia, and on the southwest and west by Dalecarlia. It is full of mountains and forests. The principal towns are The rivers Hudwicksvald, Alta, and Dilsbo. and lakes abound with fish. Its chief trade is in wood, flax, linen, iron, butter, tar, tallow, &c. It is 120 miles long, and ninety broad.

HELSTON, a populous borough of Cornwall, seated on the Cober, near its influx into the sea. It is one of those appointed for the coinage of tin, and the place of assembly for the west division of the shire. By a grant of Edward III. it has a market on Monday, and eight fairs. It had formerly a priory and a castle, and sent members to parliament in the reign of Edward I.; but was not incorporated till the 27th of queen Elizabeth, who appointed a mayor, four aldermen, and twenty-four assistants. It was re-incorporated August 16th 1774, and still sends two members to parliament. It has a large market-house, a guild-hall, and four streets in the form of a cross, with a channel of water running through each. The steeple of the church, with its spire, is ninety feet high, and a seamark. King John exempted Helston from paying toll any where but in London; and the citizens from being impleaded any where except in their own borough. It is twelve miles east of Penzance, and 274 W. S.W. of London. In the neighbourhood was formerly one of those curiosities called rocking-stones, which was thrown down by the governor of Pendennis Castle under Oliver Cromwell. Near the town is a curious heap of stones, piled loosely up, in the form of a circle, called Earth Castle, used anciently as a fortification.

HELTER-SKELTER, adv. From Saxon beolrzen rceavo, as Skinner fancies, the darkness of hell; hell, says he, being a place of confusion; in a hurry; without order; tumultuously.

Sir John, I am thy Pistol, and thy friend;

And helter-skelter have I rode to England,

And tidings do I bring. Shakspeare.

He had no sooner turned his back but they were at it helter-skelter, throwing books at one another's heads. L'Estrange.

HELVE, n. s & v. a. Sax. belge, the handle of an axe : to fit with a handle.

The slipping of an axe from the helve, whereby another is slain, was the work of God himself.

Raleigh's History.

HELVETIA, or CIVITAS HELVETIE, in ancient geography, the country of the Helvetii, which was divided into four pagi or cantons, situated to the south and west of the Rhine, by which they were divided from the Germans; and extending towards Gaul, from which they were separated by Mount Jura on the west, and by the Rhodanus and Lacus Lemanus on the south, and therefore called a Gallic nation. It was formerly a part of Celtic Gaul, but by Augustus assigned to Gallia Belgica. The modern name is Switzerland.

HELVETIC REPUBLIC. See SWITZERLAND

HELVETH, a people of Gallia Belgica, near the country of the Allobroges and the Provincia Romana; famed for bravery. See GALLIA.

HELVETIUS (Adrian), an eminent physician, born in Holland in 1656. After having studied physic at Leyden he went to Paris, where he acquired great reputation in his profession by discovering a cure for the dysentery, then prevalent. Louis XIV. gave him 1000 louis d'ors for publishing his method; made him inspector-general of the hospitals in Flanders, physician to the duke of Orleans, &c. He died at Paris in 1721, aged sixty-five. He wrote a treatise on the most common diseases, and their remedies (the best edition is that of 1724, in 2 vols. 8vo.) and other works.

HELVETIUS (John Claude), son of the preceding, was born in 1685. He was first physician to the queen; inspector-general of the military hospitals; a member of the Academy of Sciences at Paris, of the Royal Society in London, and of the Academies of Prussia, Florence, and Bologne. He was author of 1. Idée Générale de l'economie animale, 1722, 8vo. 2. Principia Physico-Medica, in tyronum medicinæ gratiam conscripta, 2 vols. 8vo. He died in 1755, aged seventy.

HELVETIUS (Claude Adrian), son of the preceding, was born at Paris in 1715, and in 1758 published a celebrated book De L'Esprit. Voltaire calls him 'a true philosopher;' but his book was stigmatised by the authors of the Journal de Trevoux, and suppressed by the government, on account of its atheistical principles. Upon this he came over to England in 1764, and went afterwards to Berlin, where he was well received by Frederick II. He wrote also 1. Le Bonheur, a poem in six cantos; 2. Of Man, a philosophical work; and, 3, The Child of Nature improved by Chance, an indecent romance. He died at Paris in 1771.

HELVICUS (Christopher), D. D., professor of divinity, Greek, and the oriental tongues, in the university of Gessen, was born near Frankfort in 1581, educated at Marpurg, and died in 1617. He published several Latin poems, lexicons, and grammars of different languages. The Hebrew language was so familiar to him that he spoke it as fluently as his mother tongue. His Chronological Tables have been greatly esteemed.

HELVII, an ancient people of Gallia Narbonensis, who possessed the country since called the Vivarais. Cæsar calls them Helvii; Pliny Helui. Their chief city was Alba, now Albi, or as others think Viviers.

HELVOETSLUYS, a sea-port town of Holland, in the department of Delft, island of Voorn. It has a handsome quay; is well fortified, and esteemed the safest harbour in the country. The largest men of war may come up to the middle of the town, and the English packet boats frequent it. In January, 1795, it surrendered to the French, under Pichegru. It is twelve miles west of Dort, and fifteen southwest of Rotterdam.

HEM, n. s., interj., v. a., & v. n. Sax. bem; Dut. hemmen; Lat. hem! The edge or border of a garment; and the verb signifies to border, or edge; to enclose; confine, and then used with a particle: hem, the interjection, the noise uttered by violent expiration of the breath.

HEM

All the skirt about

Was hemed with golden fringe. Faerie Queene. Along the shoar of silver streaming Thames,

Whose rushy bank, the which his river hems. Spenser.

I would try if I could cry hem, and have him. Shakspeare.

What lets us then the great Jerusalem With valiant squadrons round about to hem?

Fairfar. Why, Neptune, hast thou made us stand alone, Divided from the world for this, say they; Hemmed in to be a spoil to tyranny,

Leaving affliction hence no way to fly? Daniel.

So of either side, stretching itself in a narrow length, was it *hemmed in* by woody hills, as if indeed nature had meant therein to make a place for beholders. Sidney.

He loves to clear his pipes in good air, and is not a little pleased with any one who takes notice of the strength which he still exerts in his morning hems.

Addison.

Rowlers must be made of even cloth, white and gentle, without *hem*, seam, or thread hanging by.

Wiseman.

I hurry me in haste away, And find his honour in a pound,

Hemmed by a triple circle round,

Chequered with ribbons, blue and green. Pope.

Pronounce a text

Cry hem; and, reading what they never wrote. Cowper's Task

Oh! dearest father, in this agony Of pleasure and of pain—even while I kiss Thy garment's *hem* with transport, can it be That doubt should mingle with my filial joys? *Byron. Don Juan.*

HEMATIN, the coloring principle of logwood, the hematoxylon campechianum of botanists. On the watery extract of logwood, digest alcohol for a day, filter the solution, evaporate, add a little water, evaporate gently again, and then leave the liquid at rest. Hematin is deposited in small crystals, which, after washing with alcohol, are brilliant, and of a reddish-white color. Their taste is bitter, acrid, and slightly astringent. Hematin forms an orange-red solution with boiling water, becoming yellow as it cools, but recovering, with increase of heat, its former hue. Excess of alkali converts it first to purple, then to violet, and lastly to brown: in which state the hematim seems to be decomposed. Metallic oxides unite with hematin, forming a bluecolored compound. Gelatin throws down reddish flocculi. Peroxide of tin, and acid, merely redden it.

HEMELAR (John), an eminent antiquarian, and canon of Antwerp, in the seventeenth century, born at the Hague. He wrote a work entitled, Expositio Numismatum imperatorum Romanorum â Julio Cæsare ad Heraclium; which is very scarce, though it has had several editions. He died in 1640.

HEMEROBAPTISTS, a 'sect among the ancient Jews, thus called from their washing and bathing daily in all seasons; and performing this custom with the greatest solemnity, as a religious rite necessary to salvation. Epiphanius says, they denied the resurrection in common with the Sadducees, and entertained some other opinions of theirs. See SABIANS.

159

HEMEROBIUS, in zoology, a genus of insects of the neuroptera order; the characters of which are these: The mouth is furnished with two teeth; the palpi are four, the wings are deflected, but not plaited; and the antennæ are bristly, and longer than the breast. There are fifteen species, principally distinguished by their colors. They are named hemerobii from the shortness of their lives, which, however, continue several days. In the state of larva they are great devourers of plant-lice, for which it has had the name of the lion of the plant-lice. They are also cannibals, and devour each other after their transformation. The eggs are born on small gummy pedicles, spun by the insects from their abdomen. These eggs are deposited upon leaves, and set in the form of bunches. They have been taken for parasitic plants. In fifteen or sixteen days the larva attains to its full growth. With its spinning-wheel, at its tail, it makes itself a small, round, white, silky cod, of a close texture. In summer, at the end of three weeks, the hemerobius issues forth with its wings; but, when the cod has not been spun till autumn, the chrysalis remains in it the whole winter, and does not undergo its final metamorphosis till the next spring. The flight of this insect is heavy: some species have an excrementitious smell. One is named the water hemerobius, because it lives mostly at the water side. See ENTOMOLOGY.

HEMEROCALLIS, day-lily, or lily asphodel: a genus of the monogynia order, and hexandria class of plants; natural order tenth, coronariæ: COR. campanulated, tube cylindrical; the stamina declining downwards.

H. flava, the yellow day-lily, has strong fibrous roots, sending up large hollow keel-shaped leaves, two feet long, upright, leafless, firm stalks, two feet high; dividing at top into several foot-stalks, each terminated by one large liliaceous yellow flower of an agreeable odor.

H. fulva, the reddish or copper-colored daylily, has roots composed of strong fleshy fibres and large oblong tubes; radical, keel-shaped, hollow, pointed leaves, a yard long, reflected at top; with leafless stalks three or four feet high, and large copper-colored liliaceous flowers. These have large stamina, charged with a kind of brown-colored farina; which, on being touched or smelled to, is discharged in great plenty all over the hands and face. Both these species are hardy, and may be easily propagated by parting their roots.

HEMERODROMI, from ημερα, day, and Spopog, course, &c., among the ancients, were guards appointed for the security of cities and other places. They went out of the city every morning, as soon as the gates were opened, and kept all day patrolling round the place; sometimes also making excursions farther into the country, to see that there were no enemies lying in wait to surprise them. Hemerodromi were also a sort of couriers, who only travelled one day, and delivered their despatches to a fresh man, who run his day, and so on to the end of the journey. The Greeks had also these sorts of couriers, which they derived from the Persians, who first used them, as appears from Herodotus.

160

HEMEROTROPHIS, from $\eta \mu \epsilon \rho a$, a day, and τροφη, food, in antiquity, a measure of capacity, the same with the chenix; so called from its containing one day's food.

HEMI, from $\eta\mu i\sigma\nu g$, half, a word used in the composition of various terms, signifying the same with semi or demi, half.

HEM'ICYCLE, n. s. Gr. ήμίκυκλος. A half round.

HEMICYCLE, of nµ10vg, half, and Kvklog, circle, is particularly applied, in architecture, to vaults in the cradle form; and arches or sweeps of vaults, constituting a perfect semicircle. To con-struct an arch of hewn stone, they divide the hemicycle into so many voissoirs; taking care to make them an uneven number, and that there he no joint in the middle, where the key-stone should be. See BRIDGE.

IIEMIMERIS, in botany, a genus of the angiospermia order, and didynamia class of plants: CAPS. bilocular, with one of the cells more gibbous than the other: con. is wheelshaped; with one division greater, and inverse heart-shaped; the interstice of the divisions nectar-bearing.

The HEMINA, in Roman antiquity, was a liquid measure, which, according to Arbuthnot, was equal to half a wine-pint English measure; its contents being 2.818 solid inches.

HEMIOBOLON, a weight often mentioned by the ancient writers in medicine, signifying the half of the obolus, or the twelfth part of a dram, i. e. five grains.

HEMIONITES, from hemionus, a mule, in botany, mule's fern; a genus of the natural order of filices, belonging to the cryptogamia class of plants. The fructifications are in lines decussating or crossing each other.

HEMIPTERA, from $\eta\mu\iota\sigma\nu\varsigma$, half, and $\pi\tau\epsilon\rho\sigma\nu$, wing, in the Linnæan system, the second order of insects, comprehending twelve genera, viz. the blatta, mantis, gryllus, fulgora, cicada, notonecta, nepa, cimex, aphis, chermes, coccus, and thrips; and a great number of species. See ENTOMO-LOGY and ZOOLOGY.

HEMISPHERE, n. s. HEMISPHER'IC, adj. HEMISPHER'ICAL, adj. HEMISPHER'ICAL, adj. half of a globe when it is supposed to be cut through its centre in the plane of one of its greatest circles.

Night with his mantel, that is derke and rude, Gan oversprede the hemisperie about.

Chaucer. The Marchantes Tale.

The sun is more powerful in the northern hemisphere, and in the apogeum; for therein his motion Browne. is slower.

Night and her ugly subjects thou dost fright, And sleep the lazy owl of night,

Ashamed and fearful to appear,

They screen their horrid shapes with the black hemisphere. Cowley.

That place is earth, the seat of man: that light His day, which else, as the' other hemisphere, Milton. Night would invade.

A hill

Of Paradise, the highest from whose top The hemisphere of earth, in clearest ken

Stretched out to the' amplest reach of prospect lay. Id.

161

The thin film of water swells above the surface of the water it swims on, and commonly constitutes hemispherical bodies with it. Boyle.

In open prospect nothing bounds our eye, Until the earth seems joined unto the sky ;

So in this hemisphere our utmost view

Is only bounded by our king and you. Dryden. A pyrites, placed in the cavity of another of an hemispherick figure, in much the same manner as an Woodward.

acorn in its cup. HEMISPHERE, in astronomy, is particularly used for one half of the mundane sphere. The equator divides the sphere into two equal parts, called the northern and southern hemispheres. The horizon also divides the sphere into two parts, called the upper and the lower hemispheres. Hemisphere is also used for a map, or projection of half the terrestrial globe, or half the celestial sphere, on a plane. Hemispheres are frequently called planispheres.

HEMIS'TICH, n. s. Fr. hemistiche ; ήμιτίχιον. Half a verse.

He broke off in the hemistick, or midst of the verse; but seized, as it were, with a divine fury, he made up the latter part of the hemistick. Dryden.

HEMISTICH denotes also a verse not completed. Of this there are frequent examples in Virgil's Æneid; but whether they were left unfinished by design or not, is disputed : such are,

Ferro accinta vocat. Æn. II. v. 614.

And

Æn. IV. 361. Italiam non sponte sequor.

In common English verses, a short pause is required at the end of each hemistich or half verse.

HEM'LOCK, n. s. Sax. pemloc. An herb. He was met even now,

Crowned with rank fumiter and furrow-weeds, With hardocks, hemlock. Shakspeare. King Lear.

And I ha' been plucking (plants among)

Hemlock, henbane, adder's tongue, Night-shade, moon-wort, libbard's-bane,

And twice by the dogs was like to be ta'en.

Ben Jonson.

We cannot with certainty affirm, that no man cau be nourished by wood or stones, or that all men will be poisoned by hemlock. Locke.

Be air, thou hemlock drinker.

Byron. The Deformed Transformed.

HEMLOCK. See CICUTA and CONIUM.

HEMLOCK DROP-WORT. See OENANTHE.

HEMLOCK LAKE, a lake in the state of New York, United States, in Ontario county, about five miles long, north and south, and one mile wide. It empties its waters northward, joining with Honeoy Creek.

HEMLOCK, LESSER. See ÆTHUSA. HEMLOCK, WATER. See CICUTA.

HEMMINGFORD (Walter de), an English historian of the fourteenth century. He was an ecclesiastic in Gisborough Abbey, in Yorkshire, and wrote an English Chronicle, which comprehends the period between 1066 and 1308. He died in 1347.

HEMODES, in ancient geography, seven islands of Denmark, now called Zealand, Funen, Langlandt, Muen, Falster, Lalandt, and Femeren.

VOL. XI.

HEM'ORRHAGE, n. s. ? Fr. hemorragic; § Gr. αίμοβραγία. Α HEM'ORRHAGY, n. s. violent flux of blood.

Great hemorrhayy succeeds the separation.

Ray. Twenty days fasting will not diminish its quantity so much as one great hemorrhage.

much as one ground HEM'ORRHOIDS, n. s. Fr. hemorrhouns, HEM'ORRHOIDS, adj. Greek αίμοβριδες. The piles; the emrods.

Besides there are hemorrhages from the nose and hemorrhoidal veins, and fluxes of rheum. Ray.

Embost upon the field a battle stood

Of leeches, spouting hemorrhoidal blood.

				ourm.
I	got	the	hemorrhoids.	Saift.

HEMORRHOIDAL. See HEMORRHOIDAL. HEMORRHOIDS. See MEDICINE.

HEMP, n. s. Sax. bænep; Dan. hamp; HEMP'EN, adj. S Dut. hampe. A fibrous plant of which coarse linen and ropes are made. It hath digitated leaves opposite to one another; the flowers have no visible petals; it is male and female in different plants. Its bark is useful for cordage and cloth.-Miller.

In foul reproach of knighthood's fair decree, About his neck a hempen rope he wears.

Spenser. Faerie Queenc. Behold

Upon the hempen tackle ship-boys climbing.

Shakspeare.

Let gallows go for dog ; let man go free. And let not hemp his windpipe suffocate.

Id.

Ye shall have a hempen caudle then, and the help of a hatchet. Id.

Hemp and flax are commodities that deserve encouragement, both for their usefulness and profit.

Mortimer. I twitched his dangling garter from his knee; He wist not when the hempen string I drew. Gay.

HEMP. See CANNABIS. It does not appear that the ancients were acquainted with the use of hemp, in respect of the thread it affords. Pliny, who speaks of the plant in his Natural History, lib. xx. cap. 23, says not a word of this; but extols the virtues of its stem, leaves, and root. In effect, what some writers on the Roman antiquities remark, viz. that the hemp necessary for the use of war was all stored up in two cities of the western empire, viz. at Ravenna and Vienne, under the direction of two procurators, called procuratores linificii, must be understood of linum or flax.

The use of hemp is so extensive and important, that vast quantities of it are annually imported into this and other kingdoms, from those countries where it grows in greatest plenty, of which Russia is one. Sir John Sinclair informs us, that in 1785, the quantity exported from St. Petersburg in British ships was as follows :---

Clean hemp		1,038,791 poods.
Outshot .		37,382
Half-clean		18,374
Hemp-eodile		19,251

1,113,798

Allowing sixty-three poods to a ton, the above quantity will amount to 17,695 tons ; and, supposing it to take five acres to produce a ton of hemp, the whole quantity of ground requisite to this purpose would amount to 88,475 acres. The annual import of hemp to Britain and Ireland in 1799 was estimated at 121,213 tons, which, at an average of £40 per ton, amounts to £4,848,520. This circumstance will enable the reader to form some idea of the distress into which so many laboring manufacturers were thrown in 1800, by the cdicts of Paul I. prohibiting the exportation of Russian produce to any part of this kingdom.

The important uses of hemp, and the superiority of that produced in Britain to other kinds, have rendered the culture of it an object of attention to government. Accordingly, in 1787, a bounty of 3d. per stone was allowed on all the hemp raised in England; and, probably with a view to encourage the growth of English hemp, duties have been laid on that which comes from abroad.

HEMP, CHINESE, a newly discovered species of cannabis, of which an account is given in the Philosophical Transactions, vol. Ixxii. p. 46. In that paper, Mr. Fitzgerald, vice-president of the Society for Encouraging Arts, mentions his having received the seeds from the late Mr. Elliot; which being sown, according to his directions, produced plants fourteen feet high, and nearly seven inches in circumference. These being pulled in November, and steeped for a fortnight in water, were placed against a southern wall to dry. After this the hemp was found to separate easily from the woody part; and so great was the produce, that thirty-two plants yielded 34lbs. In consequence of this success, Mr. Fitzgerald applied to the directors of the India Company to procure some of the seeds from China; which being obtained, the society were furnished, in 1785, with some of the seeds, which were distributed to several of the members. Two of the species, tried by the duke of Northumberland, rose to the height of fourteen feet seven inches, and would even have risen higher had they not been hurt by a high wind. The result of Dr. Hinton's experiments is related under the article Cannabis. See CANNABIS SATURA. In Italy hemp is generally cultivated, though the Bolognese only can pretend to any superiority in the management of it. It is there sown upon the best lands, which are rich strong loams; and on which they are at all possible pains to procure a fine friable surface. For manure they use dung, pieces of rotten cloth, feathers, and horns brought from Dalmatia. The plant, however, may be cultivated upon ground of every kind ; the poorer land produc-ing that which is finer in quality, though in smaller quantity; whereas strong and rich land produces a great quantity, but coarser. It does not exhaust the land on which it grows, like flax. A Sussex manufacturer, who writes on this subject in the Annals of Agriculture, informs us, that it may be raised for many years successively on the same ground, provided it be well manured. An acre requires from nine to twelve pecks, according to the nature of the soil : the latter being the most usual, though a variation in the quality of the soil makes an alteration both in the quantity and quality of the hemp.

An acre produces on an average thirty-six or thirty-eight stone. The season for sowing it extends from the 25th of March to the 15th of June. The seed ought always to be sown thin, not exceeding two bushels to an acre; and with a drill plough still less will answer. The male and female being distinct plants, of which the latter only produces seed, regard must be had to this circumstance. In Sussex the male and female are pulled together about thirteen weeks after the sowing, but in the fens are often separated. This last method is recommended by the abbé Brulle, who directs that little paths should be made length-wise through the field, about seven feet distant, to allow a passage for the person who pulls up the male hemp, from among the females, which require to stand more than a month after, to ripen the seeds. The male hemp, or, as it is commonly but improperly called, the female hemp, is known to be ripe by the fading of the flowers, the falling of the farina fecundans, and some of the stalks turning yellow. After the whole of this kind is pulled, it must be manufactured, and ought to be worked if possible while green; the hemp thus produced being much finer than that which is previously dried. The male hemp, however, is always in smaller quantity than the female; and, therefore, where the crop is large, it will be impossible to work the whole as fast as it is pulled or cut. It is known to be ripe by the steins becoming pale; but it must be remembered that hemp of any kind will be much less injured by pulling the plants before they are ripe than by letting them stand too long. The female hemp, being stripped of its leaves, &c., will soon be dry for storing by the heat of the atmosphere, though sometimes it may be necessary to use artificial means; but, where these are used, the utmost care must be taken, the hemp when dry being exceedingly inflammable. The stored or dried hemp must be steeped and treated in every other respect as if it had been green; whence it is evident that this operation ought never to be used but in cases of necessity. It is likewise impossible to make hemp which has been dried previous to its being steeped, so white as that which has been worked green. With regard to the perfecting of hempseed for a subsequent season, it would seem proper to set apart a piece of ground for this purpose; for M. Almen, from forty plants raised in the common way, had only 111b. of seed, though the plants from which it was taken might be deemed fine; whereas, from a single plant which grew by itself, he had 7½lbs. Some are of opinion, that, by putting the clusters which contain the hemp-seed to heat and sweat, the quality is improved: as many of those seeds which would otherwise wither and die may thus arrive at perfection. But this seems problematical, as there are no experiments which show that seeds, when separated from the vegetable producing them, have any power of meliorating themselves.

After hemp is pulled, it must be taken in large handfuls, cutting off the roots (though this is not absolutely necessary), the leaves, seeds, and lateral branches being dressed off with a wooden sword or ripple. It is then to be made

up into bundles of twelve handfuls each, in order to be steeped, like flax, in water. This, or something similar, is absolutely necessary, in order to separate the bark, which is properly the hemp, from the reed or woody part. In Suffolk, this operation is called water-retting; but sometimes it is merely exposed to the air, turning the hemp frequently during the time it is exposed. This is called dew-retting; but the former method is universally deemed preferable. Such hemp as is designed for seed is seldom water-retted, though, in the opinion of the manufacturer already quoted, it would be better if it were so. Dew-retted hemp is generally stacked and covered during the winter; in January and February it is spread upon meadow land, and whitens with the frost and snow; though it is always much inferior to the other, and proper for coarser yarns only. The length of time required for steeping hemp is various, and a complete knowledge of it can only be attained by practice. In Suffolk it is usual to continue the immersion four, five, or six days ; standing water is preferred, and the same water will steep hemp three times during the season, but the first has always the best color. The abbé Brulle prefers clear and running water, especially if overhung with trees. The bundles are to be laid crosswise upon each other, taking particular notice of the manner in which they lie when put in, that they may be taken out without difficulty. His time of steeping is from six to eleven days; and it is much better to let it remain too long in the water than too short a time. The slenderest hemp requires the most soaking. The operation is known to be finished by the reed separating easily from the bark. The next operation is to separate the bark from the reed or woody part; and this may be done two ways, viz. either pulling out the reed from every stalk with the hand, or drying and breaking it like flax. The abbé Brulle is very particular in his directions for this last operation, which he calls reeding, and which may be performed either in a trough under water, or upon a table. The whole, however, may be reduced to the following, viz. pressing down the bundles either in the trough or on a table by proper weights, to keep the hemp steady on the middle and top end. Then beginning at the upper part of the bundle, pull out the reeds one by one. The rind which remains will press closely upon the remaining unreeded hemp, and keep it more steady; so that two, four, or even six stalks, may be taken at a time. The weight is then to be removed from the top, and all the pieces of reed which remain there, having been broken off in the former operation, are to be taken out. Lastly, the middle weight is to be taken off, and any small pieces which remain taken out. If the reeding is performed on a table, the bundle must be weeded frequently, though slightly; a continual dropping of water would perhaps be the best method. The hemp must next be freed from the mucilaginous matter with which it abounds. This is done by pouring water through it, squeezing out the liquid after every effusion, but taking care not to let the threads twist or entangle each other, which they will be very apt to do. The abbé is of opinion,

that soft soap should be dissolved in the last water, in the proportion of 1 oz. to 3lbs. of dry hemp, as it contributes much to soften and render the hemp easy to dress. Hemp is broken by machinery, after being steeped, in a manner similar to flax; but the instruments used for this purpose in Suffolk are all worked by the hand. That which breaks in the operation is called shorts, and is about half the value of the long hemp. The best water-retted hemp sells for about 8s. 6d. per stone; the other kind from one to two shillings lower. Beating is the next operation, which formerly was performed entirely by hand (see BEATING), but now in most places by a water-mill, which raises three heavy beaters that fall upon it alternately; the hemp being turned all the while by a boy to receive the strokes equally. The finer it is required to make the tow, the more beating is necessary. It is then dressed or combed by drawing it through heckles formed like the combs of wool manufacturers, only fixed. Sometimes it is divided into two or three sorts of tow, and sometimes the whole is worked together into one sort; the prices varying from 6d. to 1s. 6d. per pound.

The usual height of the plant when growing is from five to six feet. In Catalonia they generally rise to seven; but in Alsace they are sometimes twelve feet high, and three inches in circumference.

Only the coarser kinds of hemp are employed in making cordage, the better sorts being used for linen, which, though it can never be made so fine. as that from flax, is yet incomparably stronger, and equally susceptible of bleaching both in the old and new way. Cloths made of hemp have also this property, that their color improves by wearing, while that of linen decays. The English hemp is much superior in strength to that which grows in any other country. Next to it is the Russian, from which sacking is usually made, as it is sometimes also from the offal of the English kind, but none of the Suffolk hemp is ever made into cordage on account of its fineness. A considerable quantity of Russia sheeting is imported into England merely on account of its strength, and is much coarser at the price than any other foreign linen. Hemp is also said to possess a property as a plant which renders it almost invaluable; viz. that of driving away almost all insects that feed upon other vegetables. Hence, in some places of the continent, they secure their crops from these mischievous vermin, by sowing a belt of hemp round their gardens, or any particular which they wish to preserve.

HEMP AGRIMONY. See EUPATORIUM.

HEMP AGRIMONY, BASTARD. See AGERA-TUM.

HEMPAGRIMONY, NAKED HEADED. See VIR-BESINA.

HEMP, BASTARD. See DATISCA.

HEMPSTEAD, a post town of Queen's county, New York, on the south side of Long Island; twenty-two miles E.S. E. from New York. Population 5804. Hempstead Plains, an elevated tract of wild savannah, fifteen miles long and five broad, are chiefly in this township. These plains are naturally bare of trees; but produce M 2

neath and some grass, and afford pasture for numerous flocks of sheep and herds of cattle. Hempstead Hill is 319 feet high.

HEMS, a city of Syria (the ancient Emesa), on the borders of the desert. Under the Roman empire this was a considerable town, and the birth-place of Heliogabalus. Its walls are about three miles in circumference; and it has often changed masters. The present town stands in a plain, watered by a small river. Its ill-arranged and ill-built houses occupy about a fourth only of the space within the walls. To the south is a large ruined castle. About a furlong to the west is a piece of Roman architecture, partly Doric and partly lonic, called the sepulchre of Caius Cæsar, and Pococke supposes the designation to be just : or at least that it was a monument erected to his honor. 120 miles south of Aleppo, and eighty-five north of Damascus. Long. 37° 20' E., lat. 34° 25' N.

HEMSKERCK (Egbert), THE OLD, a celebrated Flemish painter of drolls and conversations, of whom, though his works are much esteemed, we have no information as to the time in which he flourished, or the school in which he was taught.

HEMSKERCK (Egbert), THE YOUNG, was the disciple of Peter Grebber, but imitated the manner of Brower and of the elder Hemskerck. He was born at Haerlem in 1645, but settled at London, where for a long time his works were exceedingly esteemed, though now much sunk in their value. He died in 1704.

HEMSKERCK, or HEMSKIRK (Martin), an eminent Dutch painter born at Hemskirk in 1498, and educated at Rome. He settled at Haerlem, where he died in 1574, aged seventy-six.

HEMSTERHUIS, or HEMSTERHUSIUS (Tiberius), a learned critic born at Groningen, in 1685. In 1704 he was appointed professor of mathematics and philosophy at Amsterdam; in 1717 professor of Greek and history at Franeker; and in 1740 he filled the same offices at Leyden. He published 1. The last three books of Julius Pollux's Onomasticon, in 1706: 2. Colloquies, &c., of Lucian; 3. Aristophanes's Plutus; and other learned works.

HEN, n.s. HEN-DRIVER, n. s. HEN-HARM, n.s. HEN-PECKED, adj. HEN-ROOST, n. s. HEN-COOP, n.s.

Sax. and Dut. penne; Germ. han, a cock. The female of a house cock, HEN-HARRIER, n. s. | or any other land fowl: HEN-HEARTED, adj. Chendriver, a kind of hawk: ben-harm, henharrier, a kind of kite) so called from destroy-

ing chickens : hen-hearted, cowardly ; dastardly : hen-pecked, governed by the wife : hen-roost, the place where poultry rest.

This gentil cok had in his governance Seven hennes, for to don all his plesance, Which were his sisters and his paramoures, And wonder like to him as of coloures Of which the fairest hewed in the throte, Was cleped faire Damoselle Pertelote, Chaucer. The Nonnes Preestes Talc.

The peacock, pheasant, and goldfinch cocks have glorious colours ; the hens have not. Bacon.

The hen-driver I forbear to name. Walton.

HEN

A step-dame too I have, a cursed she, Who rules my hen-pecked sire, and orders me.

Druden.

Many a poor devil stands to a whipping post for the pi'fering of a silver spoon, or the robbing of a hen-roost. L'Estrange. roost.

Whilst the hen bird is covering her eggs, the male generally takes his stand upon a neighbouring bough within her hearing, and by that means diverts her with his songs during the whole time of her sitting. Addison.

If a man prosecute gypsies with severity, his henroost is sure to pay for it. Id.

The neighbours reported that he was hen-pecked, which was impossible, by such a mild-spirited woman as his wife. Arbuthnot.

They oft have sallied out to pillage

The hen-roosts of some peaceful village. Tickell. Her house is frequented by a company of rogues, whom she encourageth to rob his hen-roosts. Swift.

O'er the trackless waste

The heath hen flutters. Thomson. At half-past eight o'clock, booms, hen-coops, spars, And all things, for a chance, had been cast loose, That still could keep afloat the struggling tars, For yet they strove, although of no great use.

Byron. Don Juan.

HEN. See PHASIANUS.

HEN, GUINEA. See NUMIDA.

HEN AND CHICKENS ISLES, a cluster of small islands in the South Pacific, near the coast of New Zealand. One of them terminates in two high peaks. Long. 180° 1' W., lat. 35° 53' S. Also a group of small islands in the Eastern Seas; in long. 118° 3' E., lat. 5° 30' S.

HENARES, a river of Spain, which rises near Siguença, and runs into the Xarama, ten miles above Toledo.

HENAULT (Charles John Francis), son of John Remi Henault, lord of Moussy, was born at Paris in 1685. Claude de Lisle, father of the celebrated geographer, taught him geography and history. On quitting college Henault entered the oratory, which he left two years after, and his father bought for him the lieutenance des chasses, and the government of Corbeil. At M. Villeroi's he formed connexions with many of the nobility, and associated with the wits till the dispute between Rousseau and De la Motte disgusted him. In 1707, he gained the prize of eloquence at the French Academy; and another next year at the Academy des Jeux Floraux. In 1713 he brought a tragedy on the stage under the disguised name of Fuselier. As he was known to the public only by some slighter pieces, Cornelia the Vestal met with no great success. In his old age Mr. Horace Walpole being at Paris in 1768, and having formed a friendship with him, obtained the MS. of this piece, and had it printed. In 1715 M. Henault, under a borrowed name, brought out a second tragedy, entitled Marius, which was well received and printed. He had been admitted counsellor in parliament in 1706, and in 1710 president of the first chamber of inquests. These important places, which he determined to fill in a proper manner, engaged him in the most solid studies. He made himself master of the Roman law, and the French ordonnances, customs, &c. M. de Morville, procureur general of the great council, being appointed ambassador to the Hague in

1718, engaged M. Henault to accompany him. On the death of Card du Bois, in 1723, he succeeded him at the French Academy. Cardinal Fleury recommended him to succeed himself as director, and he pronounced the eloge of M. de History was M. Henault's favorite Malezieux. study. In 1744 he published an Essay on Chronology, the success of which exceeded his expectations. He improved it, and it not only passed through nine editions, but was translated into English, Italian, German, and even Chinese. He next determined to reduce into the form of a regular drama one of the periods of French history, viz. the reign of Francis II. It accordingly went through five editions ; the harmony of dates and facts is exactly observed in it, and the passions interested without offence to historic truth. In 1755 he was chosen an honorary member of the Academy of Belles Lettres, being previously a member of the academies of Nanci, Berlin, The queen appointed him suand Stockholm. perintendant of her house. He composed three comedies : La Petite Maison, La Jaloux de Soi meme, and Le Reveil d'Epimenide. The subject of the last was the Cretan philosopher who is pretended to have slept twenty-seven years. Epimenides is introduced, supposing that he had slept but one night, and astonished at the change in the age of all around him; he mistakes his mistress for her mother; but, discover-ing his mistake, offers to marry her, which she refuses, though he still continues to love her. The queen was particularly rleased with this piece, and on the place of superintendant becoming vacant, by the death of M. Bernard de Conbert, she bestowed it on Henault, and consented that he should divide the profits with his predecessor's widow. On the queen's death he held the same place under the dauphiness. He made several journeys to the waters of Plombieres: in one of these he visited the deposed king Stanislaus at Luneville; and in another accompanied his friend the marquis de Pauliny ambassador to Switzerland. He died December 24th 1771, in his eighty-sixth year.

HENAULT, or HENAUT (John D'), a French poet of the seventeenth century, the son of a baker in Paris. Being patronised by the superintendant, Fouquet, he was appointed receiver of the taxes at Forez. He wrote a satirical poem on Colbert, and several other pieces of mcrit; printed at Paris, under the title of Oeuvres Diverses in 12mo. 1670; but his conduct was irregular, and his principles atheistical. He travelled into England, and went to Holland, on purpose to visit Spinoza, who, however, did not much esteem him; considering him as one of those fashionable sceptics with which every country abounds who adopt new opinions in religion not from rational conviction, but from a profligate spirit. He translated three books of Lucretius, but, falling sick, burnt them, the fear of death having put his atheistical principles to flight; and, having now become a convert, he proposed to his confessor, as a proof of his penitence, to take the sacrament with a halter about his neck. He died in 1682.

HEN-BANE, n. s. Lat. hyoscyamus; a plant. It is very often found growing upon the

sides of banks and old dunghills. This is a very poisonous plant.—*Miller*.

That to which old Socrates was cursed, Or henbane juice, to swell 'em 'till they burst.

HENBANE. See HYOSCIAMUS.

165

HE'N-BIT, n. s. Alsine foliis hedcraceis; a plant.

In a scarcity in Silesia a rumour was spread of its raining milletseed; but it was found to be only the seeds of the ivy-leaved speedwell, or small heabit. Derham's Physico-Theology.

HENCE, adv. or interj. Sax. beonan; probably of Goth. hen, here; hennes, old English.

From this place to another.

Discharge my followers'; let them hence away, From Richard's night to Bolingbroke's fair day.

Shakspeare.

The Almighty hath not built Here for his envy; will not drive us hence. Milton.

A sullen prudence drew thee hence From noise, fraud, and impertinence.

Roscommon.

Away ; to a distance. A word of command. Be not found here ; hence with your little ones.

Shakspeare. Hence with denial vain, and coy excuse.

Milton.

At a distance; in other places. Not in use. Why should I then be false, since it is true

That I must die here, and live hence by truth.

Shakspeare.

All members of our cause, both here and *hence*, That are insinewed to this action. Id.

From this time; in the future.

He who can reason well to-day about one sort of matters, cannot at all reason to-day about others, though perhaps a year hence he may. Locke.

Let not posterity a thousand years *hence* look for truth in the voluminous annals of pedants.

Arbuthnot.

For this reason; in consequence of this.

'Tis hence you lord it o'er your servile senates; How low the slaves will stoop to gorge their lusts, When aptly baited. Brooke's Gustavus Vasa.

Hence perhaps it is, that Solomon calls the fear of the Lord the beginning of wisdom. Tillotson.

From this cause ; from this ground.

By too strong a projectile motion the aliment tends to put refaction : *hence* may be deduced the force of exercise in helping digestion.

Arbuthnot on Aliments.

From this source; from this original; from this store.

My Flora was my sun : for as

One sun, so but one Flora was;

All other faces borrowed hence

Their light and grace, as stars do thence.

Suckling.

From hence is a vicious expression, which crept into use, even among good authors, as the original force of the word hence was gradually forgotten. Hence signifies from this.

An ancient author prophesied from hence, Behold on Latian shores a foreign prince!

Dryden.

ILENCE, v. a. From the adverb. To send off; to despatch to a distance. Obsolete.

Dryden.

Go, bawling cur! thy hungry maw go fill On yon foul flock, belonging not to me; With that his dog he *henced*, his flock he cursed. Sidney.

HENCEFORTH, adv. Sax. penonpopo. From this time forward.

But hennesforth I wol my processe hold

To speke of aventures, and of batailles,

That yet was never herd so gret mervailles.

Chaucer. The Squieres Tale. Thanes and kinsmen,

Henceforth be earls. Shakspeare. Macbeth. Never henceforth shall I joy again;

Never, oh never, shall I see more joy. Id. Happier thou may'st be, worthier can'st not be;

Taste this, and be henceforth among the gods, Thyself a goddess. Milton

Thyself a goddess. Milton I never from thy side henceforth will stray, "Till day droop. Id

If we treat gallant soldiers in this sort,

Who then henceforth to our defence will come ? Dryden.

HENCEFOR'WARD, *adv.* Hence and forward. From this time to all futurity.

Henceforward will I bear

Upon my target three fair shining suns.

Shakspeare.

Pardon, I beseech you ;

Henceforward I am ever ruled by you. Id. The royal academy will admit henceforward only such who are endued with good qualities. Dryden.

HENCH'MAN, n. s. Sax. bync, a servant, and man—Skinner; bengre, a horse, and man— Spelman. A page; an attendant.

And every knight had, after him riding,

Three henchmen, still upon him awaiting.

Chaucer. The Floure and the Leafe. Why should Titania cross her Oberon.

I do but beg a little changeling boy,

To be my henchman. Shakspeare. Three henchmen were for ev'ry knight assigned, All in rich livery clad, and of a kind. Dryden.

HEND, v. a. Sax. bencan, from hendo, low Lat. which seems borrowed from hand or hond, Teutonic. To seize; to lay hold upon; to crowd or surround.

For er the bishop *hent* hem with his crook, They weren in the archedekens book.

Chaucer. The Freres Talc.

The generous and gravest citizens

Have hent the gates, and very near upon

The duke is entering. Shakspeare. With that the sergeants hent the young man stont And bound him likewise in a worthless chain.

Fairfax.

HENDEC'AGON, n. s. Gr. $\forall \nu \delta i k a$ and $\gamma \omega \nu i a$. A figure of eleven sides or angles.

HENDERSON (John), an eminent English actor, horn in London March 8th, 1746. His mother having put into his hands a volume of Shakspeare, when very young, he became enamoured with the stage; and, in 1768, applied to Mr. Garrick, but met with no encouragement till 1770, when Garrick gave him a letter to Palmer, manager of the theatre at Bath, where he first exhibited, with uncommon applause, in the character of Hamlet, October 6th, 1772. In the course of that and the four subsequent seasons he represented Richard III., and other principal characters, with increasing reputation. All this time, however, Garrick and Foote refused to

166

admit him on the London theatre. But in 177" Coleman, having purchased Foote's patent, engaged him, and he was well repaid by the public; for in the first thirty-four nights no less than £4500 was drawn. The Haymarket was crowded every night even during the heat of summer, and Coleman, as an acknowledgment, gave Henderson a free benefit, which produced a large sum. In winter he was engaged by Mr. Sheridan at £10 a-week for two years at Drury Lane. In 1778 and 1779 he went to Ireland, and was introduced to most of the literati there. On the 13th of January, 1779, he married. He was now as much courted by the managers as he had formerly been slighted; but his drama drew fast to a close. His last performance was in the character of Horatius, in the Roman Father, November 3rd, 1785. He was soon after seized with a fever, which carried him off on the 25th of that month. He was interred in Westminster Abbey. He left a few poems which are esteemed.

HENDERSON, a town and county of the United States, in Kentucky, bounded north by the Ohio; east by Green and Muddy rivers, which separate it from Ohio and Mecklenburg counties; west by Tradewater River, which divides it from Livingstone county; and south by Christian county. The staple product is tobacco: but coffee is also raised. The town is seventy-five miles below Louisville.

HENEAGO, or HENEAGUAS ISLANDS, two of the most southern of the Bahamas. They are separated from each other by a passage of about five miles, and the navigation near them is very dangerous. The largest, called Great He-neagua, is of very considerable magnitude. Little Heneagua is not inhabited, and lies about twenty-eight miles W.S.W. from Pequeno, the most westerly of the Caycos Islands, and about seven miles north by east from the north-east point of the Great Heneagua. The latter island is forty-five miles in length, and nineteen wide at its greatest breadth. There are extensive salt ponds here, but the interior has scarcely ever been explored. The most westerly extremity is called Middle or Devil's Point; there is an anchorage to the south, in Fisher's Bay (between Devil's Point and the south-west point), and also to the north of it, in Ocean Blight, towards the north-west point. From this latter point a dangerous reef runs to the east about a mile from the shore, for many leagues.

HENED PENNY, in old writers, a customary payment of money instead of hens at Christmas. It is mentioned in a charter of king Edward III. Mon. Ang. tom. ii. p. 327. Du Cange is ot opinion it may be hen-penny, gallinagium, or a composition for eggs; but Cowel thinks π is misprinted hened-penny for heved-penny, or head-penny.

HENERY, or HUNDRY, an island ten miles south of Bombay, on the coast of Hindostan, and 1200 yards distant from the mainland. It is not more than 600 yards in circumference, and can only be approached on the north side; but it is thickly inhabited and fortified. In 1790 it was in possession of a Mahratta chief unmed Rogojee Augria, and was the rendezvous of pirates. Of late it has been a free government, but is still a Mahratta possession.

HENETI, an ancient people of Illyria, mentioned by Herodotus, whose marriage laws were similar to those of the ancient Babylonians. Livy says, that they came originally from Paphlagonia, mixed with a number of Trojans, under Antenor, and having settled on the coast of the Adriatic Gulf, were afterwards called Veneti.

HENGTCHEOU, a city of the first rank in China, in the province of Houquang, on the river Heng. It has a considerable manufacture of paper, and there are said to be silver mines in the neighbourhood. Long. 112° E., lat. 26° 36' N.

HENLEY (Anthony), Esq. of Grange, in Hants, the son of Sir Robert Henley, was born about the middle of the seventeenth century, and educated at Oxford, where he distinguished himself by his proficiency in the classics, and his poetical talents. Being a zealous whig, he was chosen M. P. for Andover in 1698, and in several successive parliaments for other boroughs. Inheriting a fortune of £3000 a year, which was increased by the addition of £30,000 obtained with his wife, Mary Bertie, sister to the countess of Pawlett, he was very generous to contemporary authors, many of whom dedicated their works to him. He wrote many anonymous pieces, besides the opera of Alexander, and several papers in the Tatler and Medley. He died in 1712.

HENLEY (John), M. A., commonly called orator Henley, a very singular character, was born at Melton Mowbray, Leicestershire, in 1691. His father, the Rev. Simon Henley, and his maternal grandfather, John Dowel, M. A., were both vicars of that parish. Having passed his exercises at Cambridge, and obtained the degree of B. A., he returned to his native place, where he was desired by the trustees to take the direction of the school, which he soon raised to a flourishing condition. Here he began his Universal Grammar; and wrote his poem Esther, which was well received. He was ordained a deacon by Dr. Wake, then bishop of Lincoln; and having taken his degree of M. A. was admitted to priest's orders by Dr. Gibson. After preaching many occasional sermons, he went to London, recommended by above thirty letters from the most considerable men in the country, both of the clergy and laity. He there published translations of Pliny's Epistles, of several works of Abbe Vertot, of Montfauçon's Italian Travels in folio; and many original lucubrations. His most generous patron was the earl of Macclesfield, who gave him a benefice in the country, the value of which to a resident would have been above £80 a-year; he had likewise a lecture in the city; and was as popular as any other preacher, ex-cept the celebrated George Whitefield. He soon however gave up his benefice and lecture, believing the public would be a more hospitable. protector of learning and science, than some of the higher ranks in his own order. He declaimed several years against persons of the highest rank, and occasionally, says Warburton, did Pope that honor. The poet retaliated as follows :--

⁴ Imbrowned with native bronze, lo Henley stands, Tuning his voice and balancing his hands. How fluent nonsense trickles from his tongue ! How sweet the periods, neither said nor sung ! Still break the benches, Henley ! with thy strain, While Kennet, Hare, and Gibson preach in vain, O great restorer of the good old stage, Preacher at once and zany of thy age !'

Instead of tickets this extraordinary person struck medals, which he dispersed among his subscribers: a star rising to the meridian, with this motto, Ad summa; and below, Inveniam, viam aut faciam. Each auditor paid 1s. He was author of a weekly paper, called The Hyp Doctor, for which he had $\pounds 100$ a year. In his advertisements and lectures he often introduced satirical and humorous remarks on the public transactions of the times. He died on the 14th of October, 1756.

HENLEY HOUSE, a station of New South Wales, belonging to the Hudson's Bay Company. It is on the north bank of Albany River, 150 miles south-west from Albany fort, and 110 north-west by west from Brunswick House.

HENLEY-UPON-THAMES, a market town of Oxfordshire, seven miles S. S. E. from Marlow, and thirty-five west from London. It is a place of great antiquity, though but few relics of its ancient condition are now to be discovered, as most of the houses are modern buildings, and the streets are wide, paved, and well lighted. A handsome stone bridge has been erected over the Thames. The church is an ancient building, having a handsome lofty tower, said to have been erected by Cardinal Wolsey, with a peal of eight bells. Here are three free schools, and many The principal other charitable institutions. trade is in corn, flour, malt, and beech-wood, which is sent to the metropolis by water. This town was formerly a borough, and sent members to parliament. It is now a corporate town, governed by a high steward, recorder, mayor, ten aldermen, and sixteen burgesses. The market on Thursday is always abundantly supplied with malt and grain.

HENLEY-IN-ARDEN, a market-town of Warwickshire, seven miles and a half N. N. W. from Stratford-on-Avon, and 101 from London. The town was burnt down about the time of the battle of Evesham. It is named from its situation in the ancient forest of Arden, and stands near the little river Arrow. The church, or chapel of ease, is a neat building. Market on Tuesday.

HENLOPEN, CAPE, in North America, a cape on the south-west side of the entrance of Delaware Bay, opposite to Cape May. The two capes are eighteen miles apart. Cape Henlopen is in W. long. 75° 26', N. lat. 38° 50', and has a stone light-house, 115 feet high: its foundation is nearly as much above the level of the sea. The lantern, seven or eight feet square, has eight lamps, and may be seen in the night ten leagues off. The light shortly after its erection attracted so many birds that 110 of different kinds were found dead at the top of the building one morning, and a wild duck in particular flew against it with such force as to penetrate through both the wire which guards the lamps and the glass HENNEBERG, a tract of land in Saxony, situated to the north of the principality of Wurzburg. It has a superficial extent of 850 square miles, and about 196,000 inhabitants.

HENNIKER (Sir Frederick), an English baronet, descended of a noble family, was the eldest son of general Sir Brydges Trecothic Henniker, of Newton Hall, Essex, and born November the 1st, 1793. He received his education at Eton, and St. John's College, Cambridge, succeeding his father in his title and estates in 1816. He travelled, on quitting the university, through France, Italy, Egypt, Nubia and Palestine, from which latter country he narrowly escaped with his life, from the hands of banditti, being in fact, 'wounded and left half dead' between Jerusalem and Jericho. He published in 1822 an amusing journal, entitled Notes during a Visit to Egypt, Jerusalem, &c., and died at his chambers in the Albany, after a short illness, August 6th 1825.

HENNINGES (Jerome), a Saxon genealogist, native of Lunéberg, who studied under Melancthon. He applied with zeal to historical and antiquarian researches, and produced as the result of his studies Genealogiæ Familiarum Saxonicarum, Hamburgh, 1596, folio. He died in 1597. After his decease appeared a compilation entitled Theatrum Genealogicum, omnium Ætatum et Monarchiarum Familias complectens, Magdeburgh, 4 vols. folio.

HENNUYER (John), a celebrated French Roman Catholic bishop, who saved the lives of all the Protestants in his diocese of Lisieux, during the massacre of St. Bartholomew's day, in spite of the inhuman order of Charles IX. He died in 1577, universally beloved and regretted.

HENRICIANS, in ecclesiastical history, a sect so called from Henry its founder, who, though a monk and a hermit, undertook to reform the vices of the clergy. For this purpose he left Lausanne in Switzerland, and, after visiting different places, at length settled at Thoulouse in 1147, where he exercised his ministerial function; till being opposed by Bernard, abbot of Clairval, and condemned by pope Eugenius III. at a council assembled at Rheims, he was committed to a close prison in 1148, where he died. He rejected the baptism of infants; severely censured the corrupt manners of the clergy, and treated the festivals and ceremonies of the church with contempt.

HENRICO, a county of Virginia, United States; about thirty miles long and seven broad. It is bounded by Hanover, Charles city, and Goochland counties, and James's River. A number of coal mines have been opened here, and worked to considerable profit. Coals are found 200 feet above the level of the river, and three or four feet below the surface of the ground. The chief town is Richmond. Population 12,000, including 5000 slaves.

HENRIQUELLE, a remarkable salt lake in the island of St. Domingo, about twenty-two leagues in circuit. It is inhabited by very large lizards, alligators, and land tortoises. The water is deep, clear, and bitter, having a disagreeable smell. Near the middle is an island

about two leagues long, and a league wide, in which is a spring of fresh water, stocked with cabritoes, and thence called Cabrito Island. It is eleven miles east from Port au Prince.

HENRY. Of the numerous emperors and princes of this name we can only afford room for one or two, who cannot be so well comprised in any of our general historical sketches.

HENRY IV. emperor of Germany, styled the Great, was born in 1050, and succeeded his father Henry III. in 1056, under the tutelage of his mother Agnes. In 1063 he assumed the reins of government; but soon after quarrelled with pope Gregory II., whom at one time he deposed for having presumed to judge his sovereign; but at another, dreading the effects of the papal anathemas, he had the weakness to submit to the most humiliating personal solicitations and penances to obtain absolution; which impolitic measure increased the power of the pope, and alienated the affections of his own subjects. Thus circumstanced, he re-assumed the hero, but too late; marched with an army to Rome, expelled Gregory, deposed him, and set up another pope. Gregory died soon after; but Urban II. and Paschal II. successively excited his ambitious sons, Conrad and Henry, to rebel against him, and the latter, being crowned emperor in 1106, had the monstrous inhumanity to arrest his father, and to deprive him, not only of all his dignities, but even of the necessaries of life! The unfortunate Henry IV. was reduced to such extremities (after having fought sixty-two battles in defence of the German empire), that he solicited the bishop of Spire to grant him an underchaunter's place in his cathedral, but was refused ! He died the same year at Liege, aged fifty-five, a martyr to the ignorance and superstition of the age, and to his own blind confidence in favorites and mistresses. See GER-MANY.

HENRY VIII. king of England. See ENG-LAND.

HENRY, prince of Wales, eldest son of king James VI. of Scotland, by his queen Anne, sister of the queen of Denmark, one of the most accomplished princes of the age in which he lived, was born on the 19th of February, 1594. His birth was announced by embassies to many foreign powers, with invitations to be present at the ceremony of his baptism, which was thus delayed for a considerable time. All these ambassadors were cordially received, and others appointed in return, except by the court of France. Henry IV., then king of France, neither made any present, nor appointed an ambassador. The young prince was committed to the care of the earl of Mar, who was assisted in this important charge by Annabella, countess dowager of Mar, daughter of William Murray of Tullibardine, paternal ancestor of the duke of Athol. In his sixth year he was committed to the care of Mr. Adam Newton, a Scotsman, eminently skilled in most branches of literature. Under his tutorage the prince soon made great progress in the Latin language, as well as in other branches of knowledge; insomuch that, before he had completed his sixth year, his father wrote for his use the treatise entitled

Basilikon Doron, thought to be the best of all his works. In his seventh year prince Henry began his correspondence with foreign powers. At this early period he also began to add to his literary accomplishments some of the martial kind, such as riding, the exercise of the bow and pike, the use of fire arms, &c., as well as singing, dancing, &c. On his ninth birth-day he sent a letter in Latin to the king, informing him that he had read over Terence's Hecyra, the third book of Phædrus's Fables, and two books of Cicero's Epistles; and that now he thought himself capable of performing something in the commendatory kind of epistles. His accomplishments were soon spoken of in foreign countries; and these, along with the general suspicion that James favored the Catholic party, probably induced pope Clement VIII. to propose, that, if James would entrust him with the education of the young prince, he would advance such sums of money as would effectually establish him on the throne of England. This happened a little before the death of Elizabeth; but James, notwithstanding his ambition to possess the crown of England, of which he was not yet altogether certain, withstood the temptation. On the death of queen Elizabeth James left Scotland in such haste that he had no time to take a personal leave of his son, and therefore did so by letter, which was answered by the prince in Latin. In July 1603 prince Henry was invested with the order of the garter. Being obliged to leave London, on account of the plague, he retired to Oatlands, a royal palace near Weybridge in Surrey, where a separate household was appointed for him and his sister Elizabeth. In his tenth year he applied himself to naval and military affairs. In 1606 the prince waited on his uncle Frederick III. king of Denmark, who had come to England on a visit to king James; and who was so much pleased with his company, that he presented him at parting with his vice-admiral and best ship of war, and a rapier and banger, valued at 2000 marks. In July, 1607, the Dutch ambassadors came recommended to prince Henry by the States. He had a great regard for his grand aunt lady Arabella Stewart, sister of Henry lord Darnley; and there is still extant a letter from her, acknowledging some kindness he had bestowed on a kinsman at her recommendation: and he particularly patronised Joseph Hall, afterwards bishop of Exeter. The courage, intrepidity, and martial turn of this prince, were manifest from his infancy. In August, 1607, he visited the royal navy at Woolwich, and repeatedly went to the dock-yards at Woolwich, Chatham, &c. Among his papers a list of the royal navy was found after his death, with an account of all the expenses of fitting out, manning, &c., which must now be accounted a valuable addition to the naval history of those times. His passion for naval affairs naturally led him to a desire of making geographical discoveries; of which two instances are recorded. One was in 1607, when he received from Mr. Tindal his gunner, who had been employed by the Virginia Company, a draught of James's River in that country, with a letter dated 22d June the same year. The

other was in 1612, when he employed Mr. Thomas Button, an eminent mariner, to ge in quest of a north-west passage, but who did not return till after prince Henry's death. His mar-tial disposition was displayed on occasion of his being invested in the principality of Wales, and duchy of Cornwall, June 4th, 1610; when, at the tournaments given, according to the romantic taste of the times, he gave and received thirty-two pushes of the lance, performing his part to the admiration of all who saw him, being then not sixteen years of age. In 1611 a proposal was made for a double marriage betwixt the prince of Wales and the eldest princess of Savoy, and between the prince of Savoy and lady Elizabeth; but these overtures were very coolly received by the nation. In his nineteenth year his constitution underwent a remarkable change; he began to appear pale and thin, and forebodings of a dangerous malady appeared, but were totally neglected, even after he began to be seized at intervals with fainting fits. Notwithstanding these alarming symptoms, he continued his usual employments. On the 1st of November he was blooded, the impropriety of which was manifest by the thin and dissolved state of the blood which was taken away. He expired on the 6th of November, 1612, at the age of eighteen years, eight months, and seventeen days. On opening his body, the lungs were found black, spotted, and full of corrupt matter. His funeral was not solemnised till the 7th of December. His early death concurring with the public apprehensions of the papists, and the ill opinion which the nation then had of the court, gave rise to suspicions of its being hastened by poison, which were heightened by the very little concern shown by some persons in great stations. With these notions his mother the queen was peculiarly impressed, according to Dr. Welwood; who informs us, that, when he fell into his last illness, the queen sent to Sir Walter Raleigh for his cordial, which she herself had taken some time before in a fever. Raleigh sent it, with a letter to the queen, wherein he expressed a tender concern for the prince; and, boasting of his medicine, said ' that it would certainly cure him or any other of a fever, except in case of poison.' As the prince took this medicine, and died, notwithstanding its virtues, the queen, in the agony of her grief, showed Raleigh's letter; and laid so much weight on the expression about poison, that as long as she lived she could never be persuaded but that the prince had died by that means. It is sufficient however to oppose to all such suggestions the unanimous opinion of the physicians who attended the prince, and opened his body after his death; from which, as Dr. Welwood observes, there can be no inference drawn that he was poisoned. To this may be added the authority of Sir Charles Cornwallis.

HENRY (Philip), a pious and learned nonconformist minister, was the son of Mr. John Henry, page to James, duke of York, and was born at Whitehall in 1631. He was admitted into Westminster school at twelve years of age; became the favorite of Dr. Busby, and was employed by him, with some others, in collecting materials for the Greek grammar he afterwards published. Thence he removed to Christ Church, Oxford; where, having obtained the degree of M.A., he was taken into the family of judge Puleston, at Emeral in Flintshire, as tutor to his sons, and to preach at Worthenbury. He soon after married the only daughter of Mr. Daniel Matthews of Broad-oak, near Whitchurch, by whom he became possessed of a competent estate. On the Restoration, he refused to conform, was ejected, and retired with his family to Broad-oak; where he lived about twenty-eight years.

HENRY (Matthew), an eminent dissenting minister, the son of the above, was born in 1662. He continued under his father's care till he was eighteen years of age; in which time he became well skilled in the learned languages, especially in the Hebrew, which his father had rendered familiar to him from his childhood. He was afterwards entered in Gray's Inn for the study of the law. But at length, resolving to devote his life to divinity, in 1686 he retired into the country, and was chosen pastor of a congregation at Chester, where he lived about twentyfive years, greatly esteemed and beloved by his people. He had several calls to London, which he constantly declined ; but was at last prevailed upon to accept a unanimous invitation from a congregation at Hackney. He wrote, 1. Expositions of the Bible, in 5 vols. folio. 2. Directions for Daily Communion with God. 3. A Method for Prayer. 4. Four Discourses against Vice and Immorality. 5. The Communicant's Companion. 6. Family Hymns. 7. A Scriptural Catechism; and, 8. A Discourse concerning the Nature of Schism. He died of an apoplexy at Nantwich in 1714; and was interred at Trinity church in Chester.

HENRY, OF BLIND HARRY, OF HENRY THE MINSTREL, an ancient Scottish author, distinguished by no particular surname, but well known as the composer of an historical poem reciting the achievements of Sir William Wallace. This poem continued for several centuries to be in great repute; but afterwards sunk into neglect, until 1790, when it was again released from its obscurity by a very neat and correct edition published at Perth, under the inspection and patronage of the earl of Buchan. It is difficult to ascertain the precise time in which this poet lived, or when he wrote his history, as the two authors who mention him speak somewhat differently. Dempster, who wrote in the beginning of the seventeenth century, says that he lived in 1361: but Major, who was born in 1446, says that he composed his book during the time of his infancy, which we must therefore suppose to have been a few years posterior to 1446; for, if it had been composed that very year, the circumstance would probably have been mentioned.

HENRY (Robert), D. D., author of a History of Great Britain, was born 18th of February, 1718; educated at St. Ninians and Stirling; afterwards completed his education at the university of Edinburgh, and was some time master of the grammar-school of Annan. He was licensed 27th March, 1746, and was the first licenciate of the presbytery of Annan after its

erection. In November, 1748, he was ordained a minister of a dissenting congregation at Carlisle; and on the 13th of August, 1760, was called to another at Berwick-upon-Tweed, where, in 1763, he married. He was removed to the new Gray Friars' church, Edinburgh, in November, 1768, by the influence of provost Laurie, who had married Mrs. Henry's sister; and in November, 1776, to the Old Church, where he continued till his death. In 1770 the degree of D. D. was conferred on him by the university of Edinburgh, and in 1774 he was unanimously elected moderator of the general assembly, and is the only person on record who obtained that honor the first time he was a member. While he was in Berwick he published a scheme for raising a fund for the widows and orphans of Protestant dissenting ministers in the north of England. By his activity he overcame many difficulties, and had the pleasure of seeing the scheme commence in 1762. Dr. Henry published the first five volumes of his history at his own risk. But it certainly required more than a common share of literary courage to attempt, on so large a scale, a subject so intricate and extensive as the history of Britain, from the invasion of Julius Cæsar. That Dr. Henry neither over-rated his powers nor his industry was proved by the success and repu-tation of his work. The first volume of his history, in 4to., was published in 1771, the second in 1774, the third in 1777, the fourth in 1781, and the fifth (which brings down the history to the accession of Henry VII.) in 1785. He did not profess to study the ornaments of language; but his arrangement is uniformly regular and natural, and his style simple and perspicuous. He believed that the time which might be spent in polishing a sentence was more usefully employed in ascertaining a fact: and as a book of facts and solid information, supported by authentic documents, his history will stand a comparison with any other of the same period. His profits upon the whole amounted to about £3300; a striking proof of the merit of the work. In its progress it also proved the means of introducing Dr. Henry to more extensive patronage, and in particular to that of the earl of Mansfield. That venerable nobleman thought the merit of Dr. Henry's history so considerable, that, without solicitation, after the publication of the fourth volume, he applied personally to his majesty, to bestow on the author some mark of his royal favor. In consequence of this Dr. Henry was informed, by a letter from lord Stormont, of his majesty's intention to confer on him an annual pension for life of £100, 'considering his distinguished talents and great literary merit, and the importance of the very useful and laborious work in which he was so successfully engaged, as titles to his royal countenance and favor.' The warrant was issued on the 28th of May, 1781; and his right to the pension commenced from the 5th of April preceding, and continued till his death. From the earl of Mansfield he received many other testimonies of esteem, which he was often heard to mention with the most affectionate gratitude. The 8vo. edition of his history,

171

published in 1788, was inscribed to his lordship. The 4to. edition had been dedicated to the king. From the year 1785 his bodily strength was sensibly impaired. Notwithstanding this he persisted steadily in preparing his sixth volume, which brings down the history to the accession of Edward VI., and left it in the hands of his executors almost completed. Scarcely any thing remained unfinished but the two short chapters on arts and manners; and even for these he left materials and authorities so distinctly collected, that there was no great difficulty in supplying what was wanting. This volume was published in 1792; and met with the same favorable reception from the public which had been given to the former volumes. Till the summer of 1790 he was able to pursue his studies, though not without interruptions. But he then lost his health entirely; and, with a constitution quite worn out, died on the 24th of November, in the seventy-third year of his age. He was buried in the church-yard of Polmont.

HENRY OF HUNTINGDON, an English historian of the twelfth century, canon of Lincoln, and afterwards archdeacon of Huntingdon. He wrote, 1. A history of England, which ends with the year 1154; 2. A continuation of that of Bede; 3. Chronological tables of the kings of England; 4. A small treatise on the contempt of the world; 5. Several books of epigrams and love verses; and, 6. A poem on herbs; all in Latin.

HENRY OF SUSA, a famous civilian and canonist of the thirteenth century, who acquired such reputation that he was called the source and splendor of the law. He was archbishop of Embrun about 1258, and cardinal bishop of Ostia in 1262. He wrote A Summary of the Canon and Civil Law; and A Commentary on the Book of the Decretals, composed by order of Alexander IV.

HENRY, a mountainous county of Virginia, bounded on the north by Franklin, south and south-east by Patrick, south-west by Grison, and west and north-west by Montgomery counties. It is forty miles long, and fifteen broad.

HENRY, CAPE, the south cape of Virginia, at the entrance of Chesapeake Bay. Long. 76° 16' W., lat. 37° 0' N.

HENSHALL (Samuel), an ingenious Saxon scholar of modern times. He was educated at Oxford, where he became a fellow of Brazennose. In 1798 he published a quarto volume, entitled Specimens and Parts of a Topographical, Commercial, Civil, and Nantical History of South Britain. He was also the author of The Saxon and English Languages, illustrative of each other, the impractibility of acquiring an accurate knowledge of Saxon literature through the medium of Latin phraseology, exemplified in the errors of Hickes, Wilkins, Gibson, and other scholars; and a new mode suggested of radically studying the Saxon and English languages, 4to.; Actual Survey of South Britain, by the Commissioners of William the Conqueror, completed in 1086; faithfully translated, with an Introduction, Notes, and Illustrations of S. Henshall and John Wilkinson, 4to. 1799; The Etymological Organic Reasoner; with one Sheet

of the Gothic Gospel of St. Matthew; and another of the Saxon Durham Book, in Roman Characters; and a literal English Version, 1807. Both the latter works were imperfect; the author, who was rector of St. Mary, Stratford-le-Bow, Essex, having died soon after the publication of the first number of his Organic Reasoner in 1807.

HENTING, in agriculture, a term used by the farmers for a particular method of sowing before the plough; the corn, being cast in a straight line just where the plough is to come, is by this means presently ploughed in. By this way of sowing they save a great deal of seed and other charges, a dexterous boy being as capable of sowing this way out of his hat as the most skilful seedsman. Henting is also a term used by the ploughmen, and others, to signify the two furrows that are turned from one another at the bottom, in the ploughing of a ridge. The word seems to be a corruption of ending, because these furrows made an end of plowing the ridges. The tops of the ridges they call verrings.

HEPAR SULPHURIS, alkaline sulphur, or liver of sulphur, a combination of alkali and sulphur. By the fume arising on the decomposition of hepar sulphuris by an acid, Sir T. Bergman found a method of imitating the hot or sulphureous mineral waters, to as great perfection as the cold ones are now imitated by fixed air. The process consists simply in adding the vitriolic acid to hepar sulphuris, and impregnating water with the peculiar species of air that arises from this mixture, in the same manner as when water is impregnated with the fixed air arising from the mixture of that on any other acid with chalk. The hepatic air, as Bergman calls it, is very readily absorbed by water; to which it gives the smell, taste, and all the other sensible qualities of the sulphureous waters. A Swedish cantharus of distilled water, contain-ing twelve Swedish inches and a-half, will absorb about sixty cubic inches of this hepatic air; and, on dropping into it the nitrous acid, it will appear, that a real sulphur is contained, in a state of perfect solution, in this water, to the quantity of eight grains. When any particular sulphureous water is to be imitated, we scarcely need to observe, that the saline, or other contents peculiar to it, are to be added to the artificial hepatic water. Instead of the liver of sulphur, the operator may use a mixture of three parts of filings of iron, and two parts of sulphur melted together. It may perhaps be thought that water thus prepared does not differ from that in which a portion of the hepar sulphuris has been dissolved; but it appears evidently to differ from it in this material circumstance, that in the solution of hepar sulphuris, the sulphur is held in solution by the water, by means of the alkali combined with it : whereas, in Bergman's process, it does not appear probable that the hepar sulphuris rises substantially in the form of air; for, in that case, its presence in the hepatic water might he detected by the weakest of the acids (even the mephitic) which would precipi-tate the sulphur from it. Nor can it be supposed that any portion or constituent part of the alkali itself, except a part of its remaining fixed air,

can come over. The water, therefore, must owe its impregnation to the sulphur, raised, in some peculiar manner, into the state of an elastic vapor; permanent when the experiment is made in quicksilver; but condensable in water, and rendered soluble in that fluid.

HEPAT'ICAL, adj. Lat. heputicus; Fr. HEPAT'1C, adj. Shepatique, from ηπαφ. Belonging to the liver.

If the evacuated blood be florid, it is stomach blood; if red and copious, it is hepatick. Harvey.

The cystick gall is thick, and intensely bitter; the hepatick gall is more fluid, and not so bitter.

Arbuthnot on Aliments.

HEPATIC, or hepatic air, a permanently elastic fluid, of a very disagreeable odor, obtained in plenty from combinations of sulphur with earths, alkalies, metals, &c., and sometimes from combinations of alkalies with substances which do not appear to contain any sulphur. See CHEMISTRY. Its specific gravity is to that of common air as 10,000 to 9038. The nature of this fluid has been particularly examined by Kirwan, of whose experiments an account is given in the seventy-sixth volume of the Philosophical Transactions. From the results, that gentleman concludes, that hepatic air consists merely of rarefied sulphur. Some have supposed that it consists of liver of sulphur itself volatilised; but this Kirwan denies, for the following reasons : 1. It is evidently, though weakly, acid ; reddening litmus, and precipitating acetous baro-selenite, though none of the other solutions of earths do so. 2. It may be extracted from materials which either contain no alkali at all, or next to none; as iron, sugar, oil, charcoal, &c. 3. It is not decomposed by marine or fixed air; by which, nevertheless, liver of sulphur may be decomposed. Kirwan says, he was formerly of opinion that sulphur was held in solution in hepatic air, either by means of vitriolic or marine air: but neither of these is essential to the constitution of hepatic air as such, since it is producible from materials that contain neither of these acids; and from whatever substance it is obtained, it always affords the same character, viz. that of the vitriolic acid exceedingly weakened, such an acid as we may suppose sulphur itself to be. This substance indeed, even in its concrete state, manifests the properties of an acid, by uniting with alkalies, calcareous and ponderous earths, as well as with most metals, which a very weak acid might be supposed to do. See CHEMISTRY.

HEPATITIS, in medicine, inflammation of the liver. See MEDICINE.

HEPATOSCOPIA, from $\eta \pi a \rho$, liver, and $\sigma \kappa o \pi \epsilon \omega$, I consider, in antiquity, a species of divination, wherein predictions were made by inspecting the livers of animals. The word was also used for divination by entrails.

HEPBURN (James Bonaventura), a celebrated Scottish author, of the sixteenth century, born at Oldhamstocks, in East Lothian, 1573. His father, Thomas Hepburn, who was rector of that parish, and was a convert of the celebrated John Knox, bred him up a Protestant; notwith-standing which, he had hardly completed his academical education at St. Andrews, when, either from persuasion or views of interest, he

became a Roman Catholic, and travelled into France and Italy. After this Le set out on a more extensive peregrination through Turkey, Persia, Syria, Palestine, Egypt, Ethiopia, and most other countries of note in the East. Upon his return to Europe he entered into a convent of Minims, an order of Franciscans, at Avignon, and afterwards removed to the monastery of the Holy Trinity at Rome. Pope Paul V., hearing of his great acquisitions in oriental learning, drew him from this retirement, by appointing him keeper of the oriental books and MSS. in the Vatican; in which office he continued six years. He afterwards went to Venice to translate some Hebrew, Syriac, and Chaldaic writings; and died in that city in 1620 or 1621. His works are very numerous. The most important are, 1. A Hebrew and Chaldaic Dictionary, and an Arabic grammar; printed at Rome, in 1 vol. 4to., 1591. 2. A Translation of the Psalms from the Hebrew into Latin with a Commentary: 3. An Abridged Chronicle of the Affairs of the Romans: 4. A Collection of all the Synonymous words in the Bible: 5. A Treatise on Mystical Numbers; from the Hebrew of Eben Ezra: 6. Sepher Jetzira, or the Book of the Creation; said to have been written by the patriarch Abraham: 7. The Book of Enoch: all translated, with many similar works, into Latin. His merit, however, as a linguist, is unquestionable.

HEPHÆSTIA, in antiquity, an Athenian festival in honor of Vulcan, the chief ceremony of which was a race with torches. The antagonists were three young men, one of whom, by lot, took a lighted torch in his hand, and began his course; if the torch was extinguished before he finished the race, he delivered it to the second, and he, in like manner, to the third : the victory was his who first carried the torch lighted to the end of the race; and to this successive delivering of the torch we find many allusions in ancient writers.

HEPHTHEMIMERIS, of $\varepsilon \pi \tau a$, seven, $\eta \mu \epsilon$ ovic, half, and µepoc, part, in the Greek and Latin poetry, a sort of verses consisting of three feet and a syllable; that is, of seven half-feet; called also trimetri catalectici. Such are most of the verses in Anacreon.

θελω	λεγειν	Ατρει	<i>dag</i>
θελω	δε Καδ	μονα	ê ειν, &c.

Heputhemimeris, or Hephthemimeres, is also a cæsura after the third foot ; that is, on the seventh half foot. It is a rule that this syllable, though it be short in itself, must be made long on account of the cæsura, or to make it an hephthemimeris. As in that verse of Virgil

Et furiis agitatus amor, et conscia virtus

HEPS, n.s. Hawthorn berries: commonly written hips.

swete as is the bramble flour,

That bereth the red hepe.

Chaucer. The Rime of Sire Thopas. In hard Winters there is observed great plenty of heps and haws, which preserve the small birds from Bacon. starving.

HEPS, OF HIPS. See ROSA. HEP TREE. See ROSA.

HEPTACAP'SULAR, adj. Gr. Enta and capsula. Having seven cavities or cells.

HEPTACHORD, in ancient poetry, signified verses that were sung or played on seven chords, i.e. on seven different notes. In this sense it was applied to the lyre when it had but seven strings. One of the intervals is also called an heptachord, as containing the same number of degrees between the extremes.

HEPTAGON, n. s. Fr. heptagone; Gr. ΠΕΡΤΑG'ONAL. ξ Έπτα and γωνία. A figure with seven sides or angles.

HEPTAGYNIA, from $\epsilon \pi \tau \alpha$, seven, and $\gamma \nu \nu \eta$, a female, an order of plants consisting of such as have seven styles. See BOTANY.

HEPTANDRIA, in botany, from $\epsilon \pi \tau \alpha$, seven, and $a \nu \eta \rho$, a man, the seventh class in Linnæus's sexual method, consisting of plants with hermaphrodite flowers, which have seven stamina or male organs. See BOTANY.

HEP^TTARCHY, n. s. Fr. heptarchie; Gr. $\sharp \pi \tau \alpha$ and $d \rho \chi \eta$. A sevenfold government.

In the Saxon heptarchy I find little noted of arms, albeit the Germans, of whom they descended, used shields. Camden.

England hegan not to be a people, when Alfred reduced it into a monarchy; for the materials thereof were extant before, namely, under the *heptarchy*.

Hale's Origin of Mankind.

The next returning planetary hour

Of Mars, who shared the heptarchy of power,

His steps hold Arcite to the temple bent. Dryden.

HEPTARCHY signifies a government composed of seven persons, or a country governed by seven persons, or divided into seven kingdoms.

¹ HEPTARCHY, THE SAXON, included all England, which was cantoned out into seven independent kingdoms, peopled and governed by different clans and colonies, viz. those of Kent, the South Saxons, West Saxons, East Saxons, Northumberland, the East Angles, and Mercia. The heptarchy was formed gradually from A. D. 455, when first the kingdom of Kent was erected, and Hengist assumed the title of king of Kent immediately after the battle of Eglesford; and it terminated in 827 or 828, when Egbert reunited them into one, turned the heptarchy into a monarchy, and assumed the title of king of England. See ENGLAND.

HER, pron. In Sax. bepa, bep, stood for HERS, their, or of them, which at length became the female possessive. Belonging to a female; of a she; of a woman : her is the oblique case of she; and hers is used when it refers to a substantive going before.

Nature held on *hire* hond A formell egle, of shape the gentillest That ever she among *hire* workes fönde, The most benigne, and eke the godeliest; In *hire* was every vertue at his rest, So far for the, that Nature *hireself* had blisse To loke on *hire*, and oft *hire* becke to kisse. Chaucer. The Assemblie of Foules.

About his neck

A green and gilded snake had wreathed itself, Who with *her* head, nimble in threats, approached The opening of his mouth.

Shakspeare. As You Like It.

England is so idly kinged, Her sceptre so fantastically borne, That fears attend her not. Id. Henry. HER

This pride of hers, Upon advice, hath drawn my love from her.

Shakspearc. Still new favourites she chose, 'Till up in arms my passion rose, And cast away her yoke. Cowley. One month, three days, and half an hour, Judith held the sovereign power; Wonderous beautiful her face ; But so weak and small her wit, That she to govern were unfit, And so Susanna took her place. Id. She cannot seem deformed to me, And I would have her seem to others so. Id. The moon arose clad o'er in light, With thousand stars attending on her train ; With her they rise, with her they set again. Id. Thine own unworthiness, Will still that thou art mine, not hers, confess. Id. The pleasing sight he often does prolong; Her mast erect, tough cordage, timber strong ; Her moving shape, all these he doth survey, And all admires, but most his easy prey. Marvell. Some secret charm did all her acts attend, And what his fortune wanted, hers could mend.

Dryden. Her daughter, tempered with a milder ray, Like summer clouds all silvery, smooth, and fair, Till slowly charged with thunder they display

Terror to earth, and tempest to the air, Had held till now her soft and milky way; But, overwrought with passion and despair, The fire burst forth from her Numidian veins, Even as the simoom sweeps the blasted plains. Byron. Don Juan.

HERACLEA, an ancient city and sea-port of Romania, Northern Greece, on a promontory of the gulf of Salonica, near Mount Olympus. The town at present standing on this site is called Peatamona, twenty-four miles north-east of Lanisa, and forty-three S. S. W. of Salonica.

HERACLEONITES, a sect of heretics, the followers of Heracleon, who refined upon the Gnostic system, and maintained that the world was not the immediate production of the son of God, but that he was only the occasional cause of its being created by the Demiurgus. The Heracleonites denied the authority of the Old Testament, maintained that they were mere random sounds in the air; and that St. John the Baptist was the only true voice that directed to the Messiah.

HERACLEUM, madness, a genus of the digynia order, and pentandria class of plants; natural order forty-fifth, umbellatæ. The fruit is elliptical, emarginated, compressed, and stri-ated, with a thin border : con. difform, inflexed, and emarginated; the involucrum dropping off. There are thirteen species, of which the most remarkable is-H. spondylium, the cow parsnip. It is common in many parts of Britain, and other northern parts of Europe and Asia. Gmelin, in his Flora Siberica, p. 214, tells us, that the inhabitants of Kamtschatka, about the beginning of July, collect the foot-stalks of the radical leaves of this plant, and, after peeling off the rind, dry them separately in the sun, and then, tying them in bundles, dry them carefully in the shade: in a short time afterwards these dried stalks are covered over with a yellow saccharine efflorescence, tasting like liquorice; and in this state they are eaten as a great delicacy. The Russians not only eat the stalks thus prepared, but procure from them a very intoxicating spirit. They first ferment them in water with the greater bilberries (vaccinium uliginosum), and then distil the liquor to what degree of strength they please; which, Gmelin says, is more agreeable to the taste than spirits made from corn. This may therefore prove a good succedaneum for whiskey, and lessen the consumption of barley. Swine and rabbits are very fond of this plant. In Norfolk it is called hogweed.

HERACLID/E, the descendants of Hercules, greatly celebrated in ancient history. Hercules at his death left to his son Hyllus all the rights and demands which he had upon Peloponnesus, and ordered him to marry lole, the daughter of Eurytus, as soon as he came of age. The posterity of Hercules were not more kindly treated by Eurystheus than their father had been, and they were obliged to retire for protection to the court of Ceyx, king of Trachinia. Eurystheus pursued them thither, and Ceyx, afraid of his resentment, begged the Heraclidæ to depart from his dominions. From Trachinia they came to Athens, where king Theseus, who had accompanied their father in some of his expeditions, received them with great humanity, and assisted them against Eurystheus. Eurystheus was killed by Hyllus himself; his children perished with him, and all the cities of Peloponnesus became the undisputed property of the Heraclidæ. Their triumph, however, was short ; their numbers were lessened by a pestilence; and the oracle informed them that they had taken possession of Peloponnesus before the gods permitted their return. Upon this they abandoned Peloponnesus, and came to settle in Attica, where Hyllus married Iole. Soon after he consulted the oracle, anxious to recover the Peloponnesus; and the ambiguity of the answer determined him to make a second attempt. He challenged to single combat Atreus, the successor of Eurystheus on the throne of Mycenæ; and it was mutually agreed that the undisturbed possession of Peloponnesus should be ceded to the victor. Echemus ac-cepted the challenge for Atreus; Hyllus was killed, and the Heraclidæ departed from Peloponnesus a second time, about twenty years before the Trojan war. Cleodæus, the son of Hyllus, made a third attempt, and was equally unsuccessful; and his son Aristomachus some time after met with the same unfavorable reception, and perished in the field of battle. Aris-todemus, Temenus, and Chresphontes, the three sons of Aristomachus, encouraged by the more express word of an oracle, and desirous to revenge the death of their progenitors, assembled a numerous force, and with a fleet invaded all Peloponnesus. Their expedition was attended with much success; and, after some decisive battles, they became masters of all the penin-

sula. The recovery of Peloponnesus by the Hera clidæ forms an interesting epoch in ancient history, which is universally believed to have happened eighty years after the Trojan war, or A. A. C. 1190. This conquest was totally achieved about 120 years after the first attempt of Hyllus, who was killed about twenty years before the Trojan war. As it occasioned many changes and revolutions in the affairs of Greece, the return of the Heraclidæ is the epocha of the beginning of profane history : all the time that preceded it is reputed fabulous. Accordingly Ephorus, Cumanus, Callisthenes, and Theopompus, begin their histories from this era.

HERACLIDES, a Greek philosopher of Pontus, the disciple of Speusippus, and afterwards of Aristotle, flourished about A. A. C. 336. His vanity prompted him to desire one of his friends to put a serpent into his bed just as he was dead, in order to raise a belief that he was ascended to the heavens among the gods; but the cheat was discovered. All his works are lost.

HERACLITUS, a famous Ephesian philoso pher, who flourished about the sixty-ninth Olym piad, in the time of Darius Hystaspis. He is said to have continually bewailed and wept for the wicked lives of men; contrary to Democritus, who made the follies of mankind a subject of laughter. He retired to the temple of Diana, and played at dice with the boys there; saying to the Ephesians who gathered round him, 'Worst of men, what do you wonder at? Is it not better to do thus than to govern you?' Darius invited him to come and live with him, but he refused. At last, out of hatred to mankind, he retired to the mountains, where he contracted a dropsy, by living on herbs, which killed him at sixty years of age. His writings gained him great reputation. Laertius mentions a Treatise upon Nature, divided into three books, one concerning the universe : the second on politics : the third on theology. This book he deposited in the temple of Diana; and it is said that he affected to write obscurely, lest it should be read by the vulgar, and become contemptible. The fundamental doctrine of his philosophy was, that fire is the principle of all things.

HERACLIUS, an emperor of the east, a renowned warrior, who dethroned and succeeded Phocas in 610. At this time the empire was at war with Chosroes II., king of Persia. Heraclius proposed terms of peace, but the haughty Persian refused it, unless he would renounce Christianity. Heraclius thereupon mustered his forces, and, after repeated victories, obliged him to beg for that peace he had refused. He was, however, not so successful in his wars with the Saracens. He died in 641, aged sixty-six.

HERACLIUS CONSTANTINE, son of the above, succeeded him in conjunction with his brother Heracleonas; but reigned only a few months, being poisoned by his stepmother Martina, in 641. HER'ALD, n. s. & v.a. Fr. hcrault; Teut. HER'ALDRY, n. s. *herald*; Swed. and Dan. herold. An officer whose business it is to register genealogies, adjust ensigns armorial, regulate funerals, and, anciently, to carry messages between princes, and proclaim war and peace; a precursor; forerunner; a harbinger; a proclaimer or publisher: heraldry, the art or office of a herald; a science; registry of genealogies; blazonry: the verb is now out of use.

And after hem, came a grete company Of heraudes and pursevauntes eke, Arrayed in clothes of white velvet. Chaucer. The Floure and the Leafe. We are sent from our royal master, Only to herald thee into his sight, Not pay thee. Shakspeare. After my death I wish no other herald, No other speaker of my living actions, Id. But such an honest chronicler as Griffith. When time shall serve let but the herald cry, Id. King Lear. And I'll appear again. It is the part of men to fear and tremble, When the most mighty gods, by tokens, send Such dreadful heralds to astonish us. Shakspeare. It was the lark, the herald of the morn. May none, whose scattered names honour my book, For strict degrees of rank or title look ; 'Tis 'gainst the manners of an epigram, And I a poet here, no herald am. Ben Jonson. I am writing of heraldry. Peacham. Metals may blazon common beauties; she Makes pearls and planets humble heraldry. Cleaveland. 'Twas no false heraldry when madness drew Her pedigree from those who too much knew. Denham. Embassador of peace, if peace you chuse; Dryden. Or herald of a war, if you refuse.

Please thy pride, and search the herald's toll, Where thou shalt find thy famous pedigree. Id.

Grant her, besides, of noble blood that ran In ancient veins, ere *heraldry* began. Id. The boast of *heraldry*, the pomp of power,

And all that beauty, all that wealth e'er gave, Await alike the' inevitable hour ;

The paths of glory lead but to the grave.

Gray's Elegy.

Pluck the others, but still remember Their Herald out of dim December— The morning star of all the flowers, The pledge of day-light's lengthened hours; Nor midst the roses e'er forget The virgin, virgin violet.

Byron. The Deformed Transformed.

HERALD, says Verstegan, is derived from the Saxon word Herehault, and by abbreviation heralt, which in that language signifies the champion of an army; and, growing to be a name of office, it was given to him who, in the army, had the special charge to denounce war, to challenge to battle and combat, to proclaim peace, and to execute martial messages. But the business of heralds, now, is as follows, viz. to marshal, order, and conduct all royal cavalcades, cerenonies at coronations, royal mariages, installations, creations of dukes, marquises, earls, viscounts, barons, baronets, and dubbing of knights; embassies, funeral processions, declarations of war, proclamations of peace, &c. : to record and blazon the arms of the nobility and gentry; and to regulate any abuses therein through the British dominions, under the authority of the earl marshal, to whom they are subservient. The office of the Windsor, Chester, Richmond, Somerset, York, and Lancaster heralds, is to be assistants to the kings at arms, in the different branches of their office: and they are superior to each other, according to creation, in the above order. Heralds were anciently held in much greater esteem than they are at present; and were created by the king, who, pouring wine from a gold cup on their head, gave them the herald name: but this is now done by the earl marshal. They could not arrive at the dignity of herald without being seven years pursuivant; nor quit the office of herald, but to be made king at arms. Richard III. was the first who formed them, in this kingdom, into a college; and afterwards great privileges were granted them by Edward VI, and Philip and Mary.

HERALDRY is a science which teaches how to blazon, or explain in proper terms, all that belongs to armorial bearings; and how to marshal, or dispose regularly, divers arms on a coat or shield. It also teaches whatever relates to the marshalling of solemn cavalcades, processions, and other public ceremonies at coronations, installations, creations of peers, nuptials, christenings of princes, funerals, &c.

Arms, or coats of arms, are hereditary marks of honor, made up of fixed and determined colors and figures, granted by sovereign princes, as a reward for military valor, or some signal public service; and serve to denote the descent and alliance of the bearer, or to distinguish states, cities, societies, &c., civil, ecclesiastical, and military.

Heraldry, according to Sir George Mackenzie, 'as digested into an art, and subjected to rules, must be ascribed to Charlemagne and Frederick Barbarossa, for it did begin and grow with the feudal law.' Sir John Ferne is of opinion, that we borrowed arms from the Egyptians; meaning from their hieroglyphics! Sir William Dugdale mentions, that arms, as marks of honors, were first used by great commanders in war, necessity requiring that their persons should be notified to their friends and followers. The learned Alexander Nisbet, in his System of Heraldry, says, that signs and marks of honor were made use of in the first ages of the world, and hy all nations, however simple and illiterate, to distinguish the noble from the ignoble. We find in Homer, Virgil, and Ovid, that their heroes had divers figures on their shields, whereby their persons were distinctly known.

In all ages, men have made use of symbolical signs, to denote the bravery and courage either of their chief or nation, to render themselves more terrible to their enemies, and even to distinguish themselves or families, as names do individuals. The famous C. Agrippa, in his treatise of the Vanity of Sciences, cap. 81, has collected many instances of these marks of distinction, anciently borne by kingdoms and states that were any way civilised. As to hereditary arms of families, William Camden, Sir Henry Spelman, and other judicious heralds, agree, that they did not begin till towards the end of the eleventh century. According to F. Menestrier, a French writer, whose authority is great in this matter, Henry l'Oiseleur (or the Falconer), who was raised to the imperial throne of the West in 920, by regulating tournaments in Germany, gave occasion to the establishment of family arms, or hereditary marks of honor, which undeniably are more ancient and better observed among the Germans than in any other nation. This last author also asserts, that with tournaments first came up coats of arms; which were a sort of livery, made up of several lists, fillets, or narrow pieces of stuff of divers colors, from whence came the fess, the bend, the pale, &c., which were the original charges of family arms; for they who never had been at tournaments had not such marks of distinction. They who inlisted in the crusades took up also several new figures formerly unknown in armorial ensigns; such as allerions, bezants, escalop-shells, martlets, &c. but more particularly crosses of different colors and shapes. From this it may be concluded, that heraldry, like most human inventions, was introduced and established gradually; and that, after having been rude and unsettled for many ages, it was at last methodised, perfected, and fixed by the crusades and tournaments,

These marks of honor are called arms, from their being principally and first worn by military men at war and tournaments, who had them engraved, embossed, or depicted on shields, targets, hanners, or other martial instruments. They are also called coats of arms, from the custom of the ancients embroidering them on the coats they wore over their arms, as heralds do to this day.

Arms are distinguished by different names, to denote the causes of their bearing: such as, arms of dominion, of pretension, of concession, of community, of patronage, of family, of alliance, of succession.

Arms of dominion, or sovereignty, are those which emperors, kings, and sovereign states, constantly bear; being, as it were, annexed to the territories, kingdoms, and provinces they possess. Thus the three lions are the arms of England, the fleur-de-lis those of the French, &c.

Arms of pretension are those of such kingdoms, provinces, or territories, to which a prince or lord has some claim, and which he adds to his own, although the said kingdoms or territories be possessed by a foreign prince or other lord. Thus the kings of England quartered the arms of France with their own, ever since Edward III. laid claim to the kingdom of France in 1330, on account of his being son to Isabella, sister to Charles IV. or the Fair, who died without issue; till the union with Ireland, when his majesty's arms were altered, and the French arms were thrown out.

Arms of concession, or augmentation of honor, are either entire arms, or else one or more figures, given by princes as a reward for some great service. We read in history, that Robert Bruce, king of Scotland, allowed the earl of Wintoun's ancestor to bear, in his coat armour, a crown supported by a sword, to show that he, and the clan Seaton, of which he was the head, supported his tottering crown. The late queen Anne granted to Sir Cloudesly Shovel, rear-admiral of Great Britain, a cheveron between two fleurs-de-lis in chief, and a crescent in base, to denote three great victories he had gained: two over the French, and one over the Turks.

Arms of community are those of bishoprics, cities, universities, academies, societies, companies, and other bodies corporate.

Arms of patronage are such as governors of provinces, lords of manors, patrons of benefices, &c., add to their family arms, as a token of their superiority, rights, and jurisdiction. These arms have introduced into heraldry, castles, gates, wheels, ploughs, rakes, harrows, &c.

Arms of *family*, or paternal arms, are those that belong to one particular family, that distinguish it from others, and which no person is suffered to assume without committing a crime, which sovereigns have a right to restrain and punish.

Arms of alliance are those which families or private persons take up and join to their own, to denote the alliances they have contracted by marriage. This sort of arms is either impaled, or borne in an escutcheon of pretence, by those who have married heiresses.

Arms of succession are such as are taken up by those who inherit certain estates, manors, &c., either by will, entail, or donation, and which they either impale or quarter with their own arms; which multiplies the titles of some families out of necessity, and not through ostentation, as many imagine.

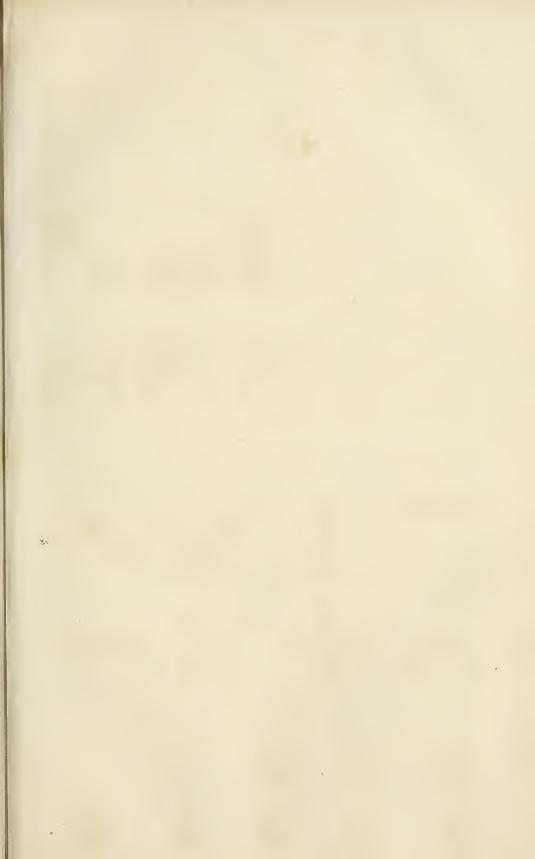

These are the eight classes under which the various sorts of arms are generally ranged; but there is a sort which blazoners call assumptive arms, being such as are taken up by the caprice or fancy of upstarts, though of ever so mean extraction, who, being advanced to a degree of fortune, assume them without a legal title. This, indeed, is a great abuse of heraldry, and common only in Britain, for on the continent no such practice takes place.

We now proceed to consider the essential and integral parts of arms, which are these:—The escutcheon; the charges; the tinctures; the ornaments.

OF THE SHIELD OR ESCUTCHEON.

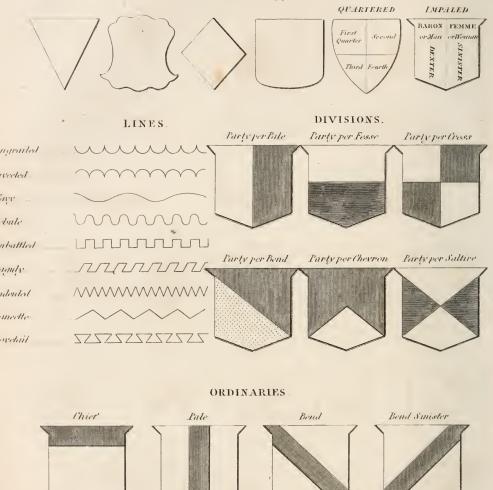

The shield or escutcheon is the field or ground whereon are represented the figures that make up a coat of arms: for these marks of distinction were put on bucklers or shields before they were placed on banners, standards, flags, and coatarmour; and, wherever they may be fixed, they are still on a plane, or superficies, whose form resembles a shield.

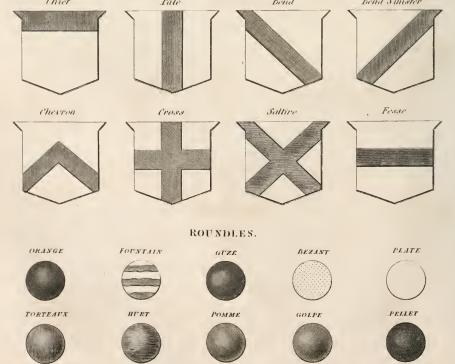

Shields, in heraldry called escutcheons, or scutcheons, have been, and still are, of different forms, according to different times and nations.

PL.ITE III

Amongst ancient shields, some were almost like a horse-shoe (see plate I. HERALDRY), others triangular, somewhat rounded at the bottom. The people who inhabited Mesopotamia, now called Diarbeck, made use of this sort of shield, which it is thought they had of the Trojans. Sometimes the shield was heptagonal, that is, had seven sides. The first of this shape is said to have been used by the famous triumvir M. Antony. That of knights banneret was square, like a banner. As to modern escutcheons, those of the Italians, particularly of ecclesiastics, are generally oval. The English, French, Germans, and other nations, have their escutcheons formed different ways, according to the carver's or painter's fancy : see the various examples in the plates. But the escutcheons of maids, widows, and of such as are born ladies, and are married to private gentlemen, is in the form of a lozenge. Sir G. M'Kenzie mentions one Muriel, countess of Strathern, who carried her arms in a lozenge, anno 1284, which shows how long we have been versant in heraldry.

Armorists distinguish several parts or points in escutcheons, in order to determine exactly the position of the bearings they are charged with; they are here denoted by the first nine letters of the alphabet, ranged in the following manner:—

A-the dexter chief

B---the precise middle chief. C---the sinister chief. D---the honor point. ; E---the fess point. F---the nombril point.

G-the dexter base. H-the precise middle base.

I-the sinister base.

The knowledge of these points is of great importance, for they are frequently occupied with several bearings of different kinds. The dexter side of the escutcheon is opposite to the left hand, and the sinister side to the right hand of the person that looks upon it.

OF TINCTURES, FURS, LINES, AND DIF-FERENCES.

By tinctures is meant that variable hue of arms which is common both to shields and their bearings. According to the ci-devant French heralds, there are but seven tinctures in armory; of which two are metals, the other five are colors.

The proper Colors.			By planets for princes, kings, and emperors.
Yellow	Or	Topaz	Sol
White	Argent	Pearl	Luna
Red	Gules	Ruby	Mars
Blue	Azure	Sapphire	Jupiter
Purple	Purpure	Amethyst	Mercury
Black	Sable	Diamond	Saturn
Green	Vert	Emerald	Venus

When natural bodies, such as animals, plants, celestial bodies, &c., are introduced into coats of arms, they frequently retain their natural colors, which are expressed in this science by the word proper.

VOL. XI.

Besides the colors above-mentioned, the English writers on heraldry admit two others, viz.

Orange, Blood-color, } termed } Tenny, Sanguine.

But these two are rarely to be found in British bearings.

These tinctures are represented in engravings and drawings (the invention of the ingenious Silvester Petra Sancta, an Italian author of the last century), by dots and lines.

Or is expressed by dots. Argent needs no mark, and is therefore plain. Azure, by horizontal lines. Gules, by perpendicular lines. Vert, by diagonal lines from the dexter chief to the sinister base points. Purpure, by diagonal lines from the sinister chief to the dexter base points. Sable, by perpendicular and horizontal lines from the sinister chief to the dexter base points, traversed by horizontal lines. Sanguine, by lines crossing each other diagonally from dexter to sinister, and from sinister to dexter.

The English heralds give different names to the roundlet, according to its color. Thus, if it is Or, it is called a Bezant; Argent, a Plate; Azure, a Hurt; Gules, a Torteux; Vert, a Pomey; Purpure, a Golpe; Sable, a Pellet; Tenny, an Orange; and Sanguine, Guze. See COLORS.

Other nations do not admit such a multiplicity of names to this figure; but call them Bezants, after an ancient coin struck at Constantinople, once Byzantium, if they are Or and Torteaux; if of any other tincture expressing the same. See plate I.

Furs represent the hairy skin of certain beasts, prepared for the doublings or linings of robes and garments of state; and, as shields were anciently covered with furred skins, they are therefore used in heraldry, not only for the linings of the mantles, and other ornaments of the shields, but also in the coats of arms themselves. There are six different kinds in use, viz.—

1. Ermine; which is a field argent, powdered with black spots, their tails terminating in three hairs.

2. Erminitis, or counter-ermine, where the field is sable, and the powdering white.

3. Erminois: the field Or, the powdering sable.

4. Vair, which is expressed by blue and white skins, cut into the forms of little bells, ranged in rows opposite to each other, the base of the white ones being always next to that of the blue ones. Vair is usually of six rows; if there be more or fewer the number ought to be expressed; and, if the colors are different from those above mentioned, they must likewise be expressed.

5. Pean; the field is sable, the powdering Or. The French used no such term : but they called all furs or 'doublings des pannes, or pennes; which term 'has possibly given rise to this mistake and many others, in those who do not understand the French language.

6. Potent, anciently called Vairy-cuppy, as when the field is filled with crutches or potents counter-placed. Vair and Potent may be any two colors.

The use of the tinctures took its rise from the

several colors used by warriors whilst they were in the army, which S. de Petra Sancta proves by many citations; and because it was the custom to embroider gold and silver on silk, or silk on cloth of gold and silver, the heralds appointed, that, in imitation of the clothes so embroidered, color should never be used upon color, nor metal upon metal.

Escutcheons are either of one tincture, or more than one. Those that are of one only, that is when some metal, color, or fur, is spread all over the surface or field, such a tincture is said to be predominant : but in such as have on them more than one, as most have, the field is divided by lines, which, according to their divers forms, receive various names.

Lines may be either straight or crooked. Straight lines are carried evenly through the escutcheon: and are of four different kinds, viz. a perpendicular line |; a horizontal, -; a diagonal dexter, \searrow ; a diagonal sinister, \swarrow .

Crooked lines are those which are carried unevenly through the escutcheon with rising and falling. French armorists reckon eleven different sorts of them; Guillim admits of seven only; the figures and names of which are to be seen in plate 1. of HERALDRY.

The principal reason why lines are thus used in heraldry is to difference bearings which would be otherwise the same; for an escutcheon charged with a chief engrailed, differs from one charged with a chief wavy, as much as if the one bore a cross and the other a saltier. As the forementioned lines serve to divide the field, if the division consists of two equal parts made by the perpendicular line, it is called parted per pale; by the horizontal line, parted per fess; by the diagonal dexter, parted per bend; by the diagonal sinister, parted per bend sinister; examples of which will be given in the sequel of this treatise.

If a field is divided into four equal parts, by any of these lines, it is said to be quartered; which may be done two ways, viz.

Quartered or parted per cross : which is made by a perpendicular and horizontal line, which, crossing each other at the centre of the field, divide it into four equal parts called quarters.

Quartered or parted per saltier; which is made by two diagonal lines, dexter and sinister, that cross one another in the centre of the field, and likewise divide it into four equal parts. See plate I.

The escutcheon is sometimes divided into a greater number of parts, in order to place in it the arms of the several families to which one is allied; and in this case it is called a genealogical achievement. These divisions may consist of six, eight, twelve, and sixteen quarters, (as the royal arms). and even sometimes of twenty, thirty-two, sixty-four, and upwards; there being examples of such divisions frequently exhibited at pompous funerals; but Sir William Dugdale very justly objects to so many arms being clustered together in one shield or banner, on account of the difficulty of discerning one coat of arms from another.

Armorists have invented many differences or characteristical marks, whereby bearers of the same coat of arms are distinguished each from others, and their nearness to the principal bearer demonstrated. According to J. Guillim, these differences are to be considered either as ancient or modern.

Those he calls ancient differences consist in bordures; which is a bearing that goes all round and parallel to the boundary of the escutcheon, in form of a hem, and always contains a fifth part of the field in breadth. Bordures were used in ancient times for the distinguishing not only of one nation or tribe from another, but also to note a diversity between particular persons descended of one family and from the same parents. This distinction, however, was not expressly signified by invariable marks; nor were bordures always appropriated to denote the different degrees of consanguinity : for, as Sir Henry Speiman observes 'ancient heralds, being fond of perspicuous differences, often inverted the paternal tincture, or sometimes inserted another charge in the escutcheon, such as bends, croslets, cantons, or the like; which irregularity has, I suppose, induced modern armorists to invent and make use of others.'

There are bordures of different forms and tinctures, and they are generally used as a difference beween families of the same name, and also as marks of illegitimacy.

A bordure is never of metal upon metal, and seldom of color upon color, but rather of the tincture which the principal bearing or charge is of. Thus Sir - Dalziel of Glenae, whose predecessor was a younger brother of the noble family of Carnwath, has within a bordure argent, the paternal coat of the ancient name of Dalziel, viz. 'Sable, a hanged man with his arms extended, argent ;' formerly they carried him hanging on a gallows. This bearing, though so very singular for a coat of arms, was given as a reward to one of the ancestors of the late Robert Dalziel, earl of Carnwarth, to perpetuate the memory of a brave and hazardous exploit performed in taking down from the gallows the body of a favorite and near relation of king Kenneth II., hung up by the Picts; which story is thus related by Alexander Nisbet : 'The king being exceedingly grieved that the body of his minion and kinsman should be so disgracefully treated, he proffered a great reward to any of his subjects who would adventure to rescue his corpse from the disgrace his cruel enemies had unjustly put upon it ; but, when none would undertake this hazardous enterprise, at last a valorous gentleman came and said to the king, Dalziel, which signifies 'I dare;' and he did actually perform that noble exploit to the king's satisfaction and his own immortal honor, and in memory of it got the aforesaid remarkable bearing; and afterwards his posterity took the word Dalziel for their surname, and the interpretation of it, I dare, continues to this day to be the motto of that noble family.' We can have no better proof of the truth of this tradition than this, that the head of this ancient family have for many ages carefully retained this bearing without any alteration or addition.

The modern differences which the English have adopted, not only for the distinguishing of sons issued out of one family, but also to denote the difference and subordinate degrees in each

house from the original ancestors, are nine; viz. For the heir or first son, the Label. Second son, the Crescent. Third son, the Mullet. Fourth son, the Martlet. Fifth son, the Annulet. Sixth son, the Fleur-de-lis. Seventh son, the Rose. Eighth son, the Cross-moline. Ninth son, the Double Quarter-foil. By these differences, the six sons of Thomas Beauchamp, the fifteenth earl of Warwick, who died in the thirty-fourth year of king Edward III., are distinguished in an old window of the church of St. Mary at Warwick ; so that, although they are called modern differences, their usage with the English is ancient. But of all the fore-mentioned marks of distinction, none but the label is affixed on the coats of arms belonging to any of the royal family; which the introducers of this peculiarity have, however, thought proper to difference by additional pendants and distinct charges on them; 1. The prince of Wales has a label Luna. 2. The duke of York has a label Luna charged with a cross Mars upon the middle Lambeaux. 3. The duke of Clarence has a label Luna, charged with a cross Mars, between two anchors Jupiter. 4. The duke of Gloucester has a label of five points Luna, the middle one charged with a fleur-de-lis Jupiter; the other four with a cross Mars. These differences are borne upon the arms and supporters. See the plates.

Sisters, except of the blood-royal, have no other mark of difference in their coats of arms, but the form of the escutcheon; therefore they are permitted to bear the arms of their father, as the eldest son does after his father's decease. The reason is by Guillim said to be, that when they are married they lose their surname, and receive that of their husbands'.

OF THE CHARGES.

Whatsoever is contained in the field, whether it occupy the whole or only a part thereof, is called a charge. All charges are distinguished by the names of honorable ordinaries, sub-ordinaries, and common charges.

Honorable ordinaries, the principal charges in heraldry, are made of lines only, which, according to their disposition and form, receive different names.

Sub-ordinaries are ancient heraldic figures, frequently used in coats of arms, and which are distinguished by terms appropriated to each of them.

Common charges are composed of natural, artificial, and even chimerical things; such as planets, creatures, vegetables, instruments &c.

The most judicious armorists admit only of nine honorable ordinaries, viz. The Chief; the Pale; the Bend; the Bend Sinister; the Fess: the Bar; the Chevron; the Cross; and the Saltier.

Of these only six have diminutives, which are called as follows: That of the chief is a fillet; the pale has a pallet and endorse; the bend, a bendlet, cost, and riband; the bend simister has the scarp and bâton; the bar, the closet and barulet; the chevron, a chevronel and coupleclose. See PLATE I.

The chief is an ordinary determined by an horizontal line, which, if it is of any other form

but straight, must be expressed. It is placed in the upper part of the escutcheon, and contains in depth the third part of the field. Its diminutive is a fillet, the content of which is not to exceed one-fourth of the chief, and stands in the lowest part thereof. This ordinary is subject to be charged with variety of figures; and may be indented, wavy, nebule, &c.

The pale is an ordinary, consisting cf two perpendicular lines drawn from the top to the base of the escutcheon, and contains the third middle part of the field. Its diminutives are, the pallet, which is the half of the pale; and the endorse, which is the fourth part of a pale. This ordinary and the pallet may receive any charge, but the endorse should not be charged. The endorse, besides, is never used, according to J. Leigh, but to accompany the pale in pairs, as cotices do the bend; but Sir John Ferne is of a different opinion.

The bend is an ordinary formed by two diagonal lines, drawn from the dexter chief to the sinister base; and contains the fifth part of the field in breadth, if uncharged; but if charged, then the third. Its diminutives are, the bendlet, which is the half of a bend : the cost or cotice, when two of them accompany a bend; which is the fourth part of a bend; and the riband, the moiety of a cost, or the eighth part of a field.

The bend sinister is of the same breadth as the bend, but drawn the contrary way: this is subdivided into a scrape, which is the half of the bend, and into a baton, which is the fourth part of the bend, but does not extend itself to the extremities of the field, there being part of it seen at both ends.

The fess is an ordinary produced by two parallel lines drawn horizontally across the centre of the field, and contains in breadth the third part thereof. Some English writers say it has no diminutive, for the bar is a distinct ordinary of itself.

The bar, according to their definition, is formed of two lines, and contains but the fifth part of the field: which is not the only thing wherein it differs from the fess; for there may be more than one in an escutcheon, placed in different parts thereof, whereas the fess is limited to the centre-point; but in this the French armorists differed from them. The har has two diminutives; the barulet, which contains the half of the bar; and the closet, which is the half of the barulet. When the shield contains a number of bars of metal and color alternate, of even number, that is called barry of so many pieces, expressing their number.

The chevron, which represents two rafters or a house well jointed together, or a pair of compasses half open, takes up the fifth part of the field with the English, but the French gave it the third. Its diminutives are, The chevronel, which contains the half of a chevron; and the couple-close, which is the half of a chevron, that is, its breadth is but the fourth part of a chevron. Leigh observes, that this last diminutive is never borne but in pairs, or with a chevron between two of them. The French had but one diminution of this ordinary called Etaye, containing the third part of its breadth. The cross is an ordinary formed by the meeting of two perpendicular with two horizontal lines in the fess point, where they make four right angles; the lines are not drawn throughout, but discontinued the breadth of the ordinary, which takes up only the fifth part of the field when not charged: but if charged, then the third. It is borne as well engrailed, indented, &c., as plain.

There is a great variety of crosses used in heraldry. Guillim has mentioned thirty-nine different sorts; De la Columbiere seventy-two; Leigh forty-six; and Upton declares he dares not ascertain all the various crosses borne in arms, for that they are almost innumerable.

The saltire, which is formed by the bend and bend sinister crossing each other in right angles, as the intersecting of the pale and fess forms the cross, contains the fifth part of the field; but if charged, then the third. In Scotland, this ordinary is frequently called a St. Andrew's cross. It may, like the others, be borne engrailed, wavy, &c., as also between charges, or charged with any other bearing.

There are other heraldic figures, called subordinaries, or ordinaries only, which, by reason of their ancient use in arms, are of worthy bearing, viz. the Gyron, Franc-quarter, Canton, Pairle, Fret, Pile, Orle, Inescutcheon, Tressure, Annulet, Flanches, Flasques, Voiders, Billet, Lozenge, Gutts, Fusil, Rustre, Mascle, Papillone, and Diaper. See the plates.

The gyron is a triangular figure formed by two lines, one drawn diagonally from one of the four angles to the centre of the shield, and the other is drawn either horizontally or perpendicularly, from one of the sides of the shield, meeting the other line at the centre of the field.

Gyronny is said, when the field is covered with six, eight, ten, or twelve gyrons, in a coat of arms: but a French author would have the true gyronny to consist of eight pieces only, which represents the coat of arms of Flora Campbell, countess of Loudon, &c., whose ancestor was created baron of Loudon in 1604 by James VI. and earl of the same place, May 12th, 1633, the ninth of Charles I.

The franc-quarter is a square figure, which occupies the upper dexter quarter of the shield. It is but rarely carried as a charge. Silvester Petra Sancta has given us a few instances of its use.

The canton is a square part of the escutcheon, somewhat less than the quarter, but without any fixed proportion. It represents the banner that was given to ancient kinghts-bannerets, and, generally speaking, possesses the dexter-chief point of the shield, as in the figure; but should it possess the sinister corner, which is but seldom, it must be blazoned by a canton sinister. J. Coats reckons it as one of the nine honorable ordinaries, contrary to most heralds' opinions. It is added to coats of arms of military men as an augmentation of honor.

The pairle is a figure formed by the conjunction of the upper half of the saltier with the under half of the pale.

The fret is a figure representing two little sticks in saltire, with a mascle in the centre interlaced. J. Gibbon terms it the herald's true lover's knot; but many dissent from his opinion.

Fretty is said when the field or bearings are covered with a fret of six, eight, or more pieces. The word fretty may be used without addition, when it is of eight pieces; but if there be less than that number, they must be specified.

The pile, which consists of two lines, terminating in a point, is formed like a wedge, and is borne engrailed, wavy, &c., as in the figure. It issues in general from the chief, and extends towards the base; yet there are some piles borne in bend, and issuing from other parts of the field.

The orle is an ordinary composed of two lines going round the shield, the same as the bordure, but its breadth is but one-half of the latter, and at some distance from the brim of the shield.

The inescutcheon is a little escuteneon borne within the shield; which, according to Guillim's opinion, is only to be so called when it is borne single in the fess point or centre.

The tressure is an ordinary commonly supposed to be the half of the breadth of an orle, and is generally borne flowery and counter-flowery, as it is also very often double, and sometimes treble. This double tressure makes part of the arms of Scotland, as marshalled in the royal achievement, and granted to the Scottish kings by Charlemagne, emperor and king of France, when he entered into a league with Achaicus, king of Scotland, to show that the French lilies should defend and guard the Scottish lion.

The annulet, or ring, is a well-known figure, and is frequently to be found in arms through every kingdom in Europe.

The flunches are formed by two curved lines, or semicircles, being always borne double. G. Leigh observes, that on two such flanches two sundry coats may be borne.

The flasques resemble the flanches, except that the circular lines do not go so near the centre of the field. Gibbon would have these two ordinaries to be both one, and written flank; alleging, that the two other names are but a corruption of this last: but, as G. Leigh and J. Guillim make them two distinct and subordinate ordinaries, we insert them here as such.

The voiders are by Guillim considered as a subordinate ordinary, and are not unlike the flasques, but they occupy less of the field.

The billet is an oblong square, twice as long as broad. Some heralds imagine, that they represent bricks for building: others more properly consider them as representing folded paper or letters.

The lozenge is an ordinary of four equal and parallel sides, but not rectangular; two of its opposite angles being acute, and the other two obtuse.

Guttes, or Drops, are round at bottom, waved on the sides, and terminate at the top in points. Heralds have given them different names according to their different tinctures : thus, if they are yellow, they are called guttés d'or; if white, d'eau; if red, de sang; if blue, de larmes; if green, de vert; if black, de poix.

The fusil is longer than the lozenge, having

its upper and lower part more acute and sharp than the other two collateral middle parts, which acuteness is occasioned by the short distance of the space between the two collateral angles; - which are used in coats of arms, those most which space, if the fusil is rightly made, is always shorter than any of the four equal geometrical lines whereof it is composed.

The rustre is a lozenge pierced round in the middle, called by the Germans rutten.

The mascle is pretty much like a lozenge, but voided or perforating through its whole extent, showing a narrow border, as in the figure.

Papillone is an expression used for a field or charge that is covered with figures like the scales of a fish. M. Baron gives us an example of it in the arms of Monti, Gueules Papelone d'Argent. The proper term for it in English would be scallop-work.

Diapering is said of a field or charge, shadowed with flourishings or foliage with a color a little darker than that on which it is wrought. The Germans frequently use it; but it does not enter into the blazoning or description of an arms; it only serves to embellish the coat.

If the fore-mentioned ordinaries have any atributes, that is, if they are engrailed, indented, wavy, &c., they must be distinctly specified, after the same manner as the honorable ordinaries.

As in all ages men have made use of representations of animals and other symbols to distuguish themselves in war, human ingenuity has been not a little exerted, in multiplying these marks of distinction, by all sorts of figures, some natural, others artificial, and many chimerical; in allusion to the state, quality, or inclination of the hearer.

Hence the sun, moon, stars, comets, meteors, &c., have been introduced to denote glory, grandeur, power, &c. Lions, leopards, tigers, serpents, stags, &c., have been employed to signify courage, strength, prudence, swiftness, &c. War, hunting, music, &c., have furnished lances, swords, pikes, arms, harps, &c. Architecture, columns, cheverons, &c., and the other arts various things that relate to them.

Human bodies, or parts of them, as well as clothes and ornaments, have, for particular in-tentions, found place in armory. Trees, plants, fruits, and flowers, have also been adopted to denote the rarities, advantages, and singularities, of different countries.

The relation of some creatures, figures, &c., to particular names, has been likewise a very fruit-ful source of variety in arms. Thus the family of Coningsby bears three coneys; of Arundel, six swallows, from hirundo, the Latin for a swallow; of Urson, a bear, from the Latin ursus; of Lucie, three pikes, in Latin tres lucios pices; of Starkey, a stork; of Castleman, a castle tripletowered; of Shuttleworth, three weavers' shuttles, &c.

Besides these natural and artificial figures, many chimerical or imaginary ones are used in heraldry, the result of fancy and caprice; such as centaurs, hydras, phœnixes, griffins, dragons, &c. This great variety of figures prevents us from comprehending all common charges in a work of this nature; therefore such only are treated of as are most frequently borne in coats of arms.

I. Among the multitude of natural figures usually borne are, for the sake of brevity as well as perspicuity, distributed into the following classes, viz. 1. Celestial figures; as, the sun, moon, stars, &c., and their parts. 2 Effigies of men, women, &c., and their parts. 3. Beasts; as lions, stags, foxes, bears, &c., and their parts. 4. Birds; as, eagles, sours, etc., and then parts: and their parts. 5. Fishes; as, dolphins, whales, sturgeons, trouts, &c., and their parts. 6. Rep-tiles and insects; as, tortoises, serpents, grass-hoppers, &c., and their parts. 7. Vegetables; as, trees, plants, flowers, herbs, &c., and their parts. 8. Stones; as, diamonds, rubies, pebbles, rocks,

These charges have, as well as ordinaries, various attributes or epithets, which express their qualities, positions, and dispositions. Thus the sun is said to be in his glory, eclipsed, &c. The moon, in her complement, increscent, &c. Animals are said to be rampant, passant, &c. Birds have also their denominations, such as close, displayed, &c. Fishes are described to be hauriant, naiant, &c. Lions are termed lioncels, if more than two in a field, and eagles eaglets. A lion is said to be couchant, when lying down; and rampant, when standing on his hind legs, and rearing up his fore feet, as if climbing. Trees and plants are also said to be trunked, eradicated, fructuated, or raguled. according as they are represented in arms. See plate II.

II. Of artificial figures, borne in coats of arms, some are taken from warlike instruments; as swords, arrows, battering rams, gauntlets, helmets, spears, pole-axes, &c. Others from ornaments used in royal and religious ceremonies; as crowns, coronets, mitres, wreaths, crosiers, &c. Others are borrowed from architecture; as towers, castles, arches, columns, plummets, battlements, churches, portcullisses, &c. Others from navigation; as ships, anchors, rudders, pendants, sails, oars, masts, flags, galleys, lighters, &c.

All these bearings have different epithets, serving either to express their position, disposition or make: viz. swords are said to be erect, pom melled, hilted, &c.; arrows, armed, feathered &c.; towers, covered, embattled, &c.; and so o of all others.

III. Chimerical Figures form the last as the oddest kind of bearings in coats of arm Under the name of chimerical figures, herald rank all representations of things that have n real existence, but are mere fabulous and fantatical inventions. These, charges, griffons, marlets, and unicorns excepted, are not common British coats. Those most in use are the follo ing, viz.-

Angels, Cherubim, Tritons, Centaurs, Mai lets, Griffons, Unicorns, Dragons, Mermaid Satyrs, Wiverns, Harpies, Cockatrices, Phænixe and Sphinxes. These, like the foregoing charges are subject to various positions and dispositions which, from the principles already laid down will be plainly understood.

To these figures may be added the montegre, an imaginary creature, 'supposed to have the body of a tiger with a satyr's head and horns; also those which have a real existence, but are said to be endowed with extravagant and imaginary qualities, viz. the salamander, beaver, chameleon, &c.

OF THE EXTERNAL ORNAMENTS OF ESCUTCHEONS.

The ornaments that accompany or surround the escutcheons were introduced to denote the birth, dignity, or office of the persons to whom the coat of arms appertains; which is practised both among the laity and clergy. Those most in use are of ten sorts, viz. Crowns, Coronets, Mitres, Helmets, Mantlings, Chapeaux, Wreaths, Crests, Scrolls, and Supporters.

The first crowns were only diadems, bands, or fillets; afterwards they were composed of branches of trees, and then flowers were added to them. Among the Greeks, the crowns given to those who carried the prize at the Isthmian games were of pine; at the Olympic of laurel; and at the Nemean of smallage.

Examples of some of these ancient crowns are frequently met with in modern achievements, as the mural crown; the naval or rostral crown; the castrense or vallary crown; the civic crown; the radiated crown; the celestial crown, formed like the radiated, with the addition of a star on each ray, is only used upon tomb-stones, monuments, and the like. Others of the ancient crowns are still borne as crests.

But modern crowns are only used as ornaments, which emperors, kings, and independent princes set on their heads, in great solemnities, to denote their sovereign authority. These are the most in use in heraldry, and are as follows :---

The crown of the kings of Great Britain, see plate of crowns, is a circle of gold, bordered with pearls and precious stones, and heightened up with four large fleurs-de-lis, and four crosses pattee alternately; from these rise four arched diadems adorned with pearls, which close under a mound, surmounted of a cross like those at bottom. Mr. Sandford, in his Genealogical History, remarks, that Edward IV. is the first king of England, who in his seal, or on his coin, is crowned with an arched diadem.

The crowns of Spain and Portugal are a ducal coronet, heightened up with eight arched diadems that support a mound, ensigned with a plain cross. Those of Denmark and Sweden consist of eight arched diadems, rising from a marquis's coronet, which conjoin at the top under a mound ensigned with a cross botone.

The crowns of most other kings in Europe are circles of gold, adorned with precious stones, and heightened up with large trefoils, and closed by four, six, or eight diadems, supporting a mound, surmounted with a cross.

The grand seignior bears over his arms a turban, enriched with pearls and diamonds, under two coronets, the first of which is made of oyramidical points heightened up with large pearls, and the uppermost is surmounted with crescents.

The pope appropriates to himself a tiara, or

long cap of golden cloth, from which hang two pendants embroidered and fringed at the ends, semée of crosses of gold. This cap is enclosed by three marquis's coronets; and has on its top a mound of gold, whereon is a cross of the same, which cross is sometimes represented by engravers and painters pometted, recrossed, flowery, or plain. It appears, from very good authority, that Boniface VIII., who was elected in 1295, was the first who encompassed his cap with a coronet; Benedict XII., in 1335, added a second to it; and John XXIII., in 1411, a third; with a view to indicate by them, that the pope is the sovereign priest, the supreme judge, and the sole legislator amongst Christians.

The coronet of the prince of Wales, or eldest son of the king of Great Britain, was anciently a circle of gold set round with four crosses pattee, and as many fleurs-de-lis alternately; but, since the Restoration, it has been closed with one arch only, adorned with pearls, and surmounted of a mound and cross, and bordered with ermine like the king's. But, besides the coronet, his royal highness has another distinguishing mark of honor, peculiar to himself, viz. a plume of three ostrich feathers, with a coronet of the ancient princes of Wales. Under it, in a scroll, is this motto, 'Ich dien,' which in the German or old Saxon language signifies, I serve. This device was at first taken by Edward prince of Wales, commonly called the Black Prince, after the famous battle of Cressy, in 1346, where, having with his own hand killed John, king of Bohemia, he took from his head such a plume, and put it on his own.

The coronet of all the princes, immediate sons and brothers of the kings of Great Britain, is a circle of gold, bordered with ermine, heightened up with four fleurs-de-lis, and as many crosses-pattées alternate. The particular and distinguished form of such coronets as are appropriated to princes of the blood-royal is described and settled in a grant of the 13th of Charles II.

The coronet of the princesses of Great Britain is a circle of gold, bordered with ermine, and heightened up with crosses-pattées, fleurs-de-lis, and strawberry leaves alternate.

A duke's coronet is a circle of gold bordered with ermine, enriched with precious stones and pearls, and set round with eight large strawberry or parsley leaves.

À marquis's coronet is a circle of gold bordered with ermine, set round with four strawberry leaves, and as many pearls on pyramidical points, equal height, alternate.

An earl's coronet is a circle of gold, bordered with ermine, heightened up with eight pyramidical points or rays, on the tops of which are as many large pearls, placed alternately with as many strawberry leaves, but the pearls much higher than the leaves.

A viscount's coronet differs from the preceding ones as being only a circle of gold bordered with ermine, with large pearls set close together on the rim, without any limited number, which is his prerogative above the baron, who is limited.

A baron's coronet, which was granted by

king Charles II., is formed with six pearls set at equal distances on a gold circle, bordered with ermine, four of which only are seen on engravings, paintings, &c., to show he is inferior to the viscount.

The eldest sons of peers, above the degree of a baron, bear their father's arms and supporters with a label, and use the coronet appertaining to their father's second title; and all the younger sons bear their arms with proper differences, but use no coronets.

As the crown of the king of Great Britain is not quite like that of other potentates, so most of the coronets of foreign noblemen differ a little from those of the British nobility.

The archbishops and bishops of England and Ireland place a mitre over their coats of arms. It is a round cap pointed and cleft at the top, from which hang two pendants fringed at both ends; with this difference, that the bishop's mitre is only surrounded with a fillet of gold, set with precious stones; whereas the archbishop's issues out of a ducal eoronet.

This ornament, with other ecclesiastical garments, is still worn by the archbisbops and bishops of the church of Rome, whenever they officiate with solemnity; but it is never used in England except on coats of arms.

The helmet was formerly worn as a defensive weapon, to cover the bearer's head and face; and is now placed over a coat of arms as its chief ornament, and the true mark of gentility. There are several sorts, distinguished by the matter they are made of, by their form, and by their position.

As to the matter they are, or rather were, made of: the helmets of sovereigns were of burnished gold damasked; those of princes and lords, of silver figured with gold; those of knights, of steel adorned with silver; and those of private gentlemen, of polished steel.

As to their form: those of the king and the royal family, and noblemen of Great Britain, are open-faced and grated, and the number of bars serves to distinguish the bearer's quality; that is, the helmet appropriated to the dukes and marquises is different from the king's, by having a bar exactly in the middle, and two on each side, making but five bars in all; whereas, the king's helmet has six bars, viz. three on each side. The other grated helmet with four bars is common to all degrees of peerage under a marquiss. The open-faced helmet without bars denotes baronets and knights. The close helmet is for all esquires and gentlemen.

Their position is also looked upon as a mark of distinction. The grated helmet in front belongs to sovereign princes. The grated helmet in profile is common to all degrees of peerage. The helmet standing direct without bars, and the beaver a little open, denotes baronets and knights. Lastly, the side-standing helmet, with beaver close, is the way of wearing it amongst esquires and gentlemen.

Mantlings are pieces of cloth, jagged or cut into flowers and leaves, which now-a-days serve as an ornament for escutcheons. They were the ancient coverings of helmets, to preserve them, or the bearer, from the injuries of the weather; as also to prevent the ill consequences of their too much dazzling the eye in action. But Guillim very judiciously observes, that their shape must have undergone a great alteration since they have been out of use, and, therefore, might more properly be termed flourishings than mantlings.

The French heralds assure us, that these mantlings were originally only short coverings which commanders wore over their helmets; and that, going into battles with them, they often, on their coming away, brought them back in a ragged condition, occasioned by the many cuts they had received on their heads; and, therefore, the more hacked they were, the more honorable they were accounted; as our colors, in time of war, are the nore esteemed for having been shot through in many places.

Sometimes skins of beasts, as lions, bears, &c. were thus borne, to make the bearer look more terrible; and this occasioned the doubling of mantlings with furs.

A chapeau, is an ancient hat, or rather cap of dignity, worn by dukes, generally scariet-colored velvet on the outside, lined and turned up with fur; of late frequently to be met with above a helmet, instead of a wreath, under gentlemen's and noblemen's crests. Heretofore they were seldom to be found, as of right appertaining to private families; but by the grants of Robert Cooke, Clarencieux, and other succeeding heralds; these, together with ducal coronets, are now frequently to be met with in families who yet claim not above the degree of gentlemen.

The wreath is a kind of roll, made of two skeins of silk of different colors twisted together, which ancient knights wore as a head-dress when equipped for tournaments. The colors of the silk are always taken from the principal metal and color contained in the bearer's coat of arms. They are still accounted one of the lesser ornaments of escutcheons, and are placed between the helmet and the crest. In the time of Henry I., and long after, no man who was under the degree of a knight had his crest set on a wreath; but this, like other prerogatives, has been infringed.

The crest is the highest part of the ornaments of a coat-of-arms. It is called erest from the Latin word cresta, which signifies comb or tuft, such as many birds have upon their heads, as the peacock, pheasant, &c., in allusion to the place on which it is fixed. Crests were formerly great marks of honor, because they were only worn by heroes of great valor, or by such as were advanced to some superior military command, that they might be the better distinguished in an engagement, and thereby rally their men if dispersed; but they are at present considered as a mere ornament. The crest is frequently a part either of the supporters, or of the charge borne in the escutelicon. Thus the crest of the royal achievement of Great Britain is a lion guardant crowned.

The scroll is the ornament placed sometimes above the crest, but most usually below the shield and supporters; containing a motto or short sentence, alluding thereto, or to the bear-

ings; or to the bearer's name, as in the two following instances. The motto of the earl of Cholmondeley is, Cassis tutissima virtus, i.e. Virtue is the safest helmet; on account of the helmet in the coat of arms. The motto of the right honorrable lord Fortescue is, Forte scutum salus ducum, i. e. A strong shield is the safety of commanders; alluding to the name of that ancient family. Sometimes it has reference to neither, but expresses something divine or heroic; as that of the earl of Scarborough, Murus æreus conscientia sana, i.e. A good conscience is a wall of brass. Others are ænigmatical; as that of the royal achievement, which is, Dieu et mon droit, i.e. God and my right; introduced by Edward III. in 1340, when he assumed the arms and title of king of France, and began to prosecute his claim, which occasioned long and bloody wars, fatal, by turns, to both kingdoms. Mottos, though hereditary in the families that first took them up, have been changed on some particular occasions, and others appropriated in heir stead, instances of which are sometimes met with in the history of families.

Sometimes there are two mottos, as in the royal arms of Scotland; where the one, In defence, is placed in a scroll above the crest; and the other, Nemo me impune lacessit, in a scroll under the shield and supporters. Sometimes a third motto is added, as in the royal arms of Great Britain, where the garter, with its motto Honi soit qui mal y pense, surrounds the shield.

Supporters are figures standing on the scroll, and placed at the side of the escutcheon; they are so called because they seem to support or hold up the shield. The rise of supporters is, by M. Menestrier, traced up to ancient tournaments, wherein the knights caused their shields to be carried by servants or pages under the disguise of lions, bears, griffons, blackamoors, &c., who also held and guarded the escutcheons, which the knights were obliged to expose to public view for some time before the lists were opened. Sir George M'Kenzie, who dissents from this opinion, says, ' That the first origin and use of them was from the custom which ever was, and is, of leading such as are invested with any great honor to the prince who confers it: thus, when any man is created a duke, marquis, or knight of the garter, or any other order, he is supported by, and led to the prince betwixt, two of the same quality, and so receives from him the symbols of that honor; and, in remembrance of that solemnity, his arms are thereafter supported by any two creatures he chooses.' Supporters have formerly been taken from such animals or birds as are borne in the shields, and sometimes they have been chosen as bearing some allusion to the names of those whose arms they are made to support. The supporters of the arms of Great Britain, since the accession of king James I. to the throne, are a lion rampant guardant crowned or, on the dexter side; and a unicorn argent, crowned, armed, unguled, maned, aud gorged with an antique crown, to which a chain is affixed, all or, on the sinister. Bearing coats of arms supported is, according to the heraldic rules of England, the prerogative, 1. Of those called nobiles majores, viz. dukes, marquises,

earls, viscounts, and barons. 2. Of all knights of the garter, though they should be under the degree of barons; and, 3, Of knights of the bath. who both receive on their creation a grant of supporters. And, lastly, of such knights as the king chooses to bestow this honor upon; as in the instance of Sir Andrew Fountain, who was knighted by Philip, earl of Pembroke, when lord lieutenant of Ireland, Fountain being then secretary; and, on his return to England, king William granted him supporters to his arms, viz. two griffons gules and or. In Scotland all the chiefs of clans or names have the privilege of claiming supporters; also the baronets. But by act of parliament, 10th September, 1672, none are allowed to use either arms or supporters, without the lord Lyon's authority, under a penalty and confiscation of all moveables whereon such arms are put.

OF THE RULES OF HERALDRY.

The rules for blazoning, such as the ancient usage and laws of heraldry have established amongst us, are the following :---

1. The first and most general rule is, to express heraldic distinctions in proper terms, so as not to omit any thing that ought to be specified, and at the same time to be clear and concise without tautology.

2. Begin with the tincture of the field, and then proceed to the principal charges which possess the most honorable place in the shield, such as fess, cheveron, &c., always naming that charge first, which lies next and immediately upon the field.

3. After naming the tincture of the field, the honorable ordinaries, or other principal figures, specify their attributes, and afterwards their metal or color.

4. When an honorable ordinary, or some one figure, is placed upon another, whether it be a fess, cheveron, cross, &c., it is always to be named after the ordinary or figure over which it is placed, with one of these expressions, sur tout, or over all.

5. In blazoning such ordinaries as are plain, the bare mention of them is sufficient; but, if an ordinary should be made of any of the crooked lines mentioned above, its form must be specified, that is, whether it be engrailed, wavy, &c.

6. When a principal figure possesses the centre of the field, its position is not to be expressed, or (which amounts to the same thing), when a bearing is named, without specifying the point where it is placed, then it is understood to possess the middle of the shield.

7. The number of the points of mullets or stars must be specified when more than five; and also, if a mullet or any other charge be pierced, it must be mentioned as such, to distinguish it from what is plain.

8. When a ray of the sun, or other single figure, is borne in any other part of the escutcheon than the centre, the point it issues from must be named.

9. The natural color of trees, plants, fruits, birds, &c., is no otherwise to be expressed in blazoning but by the word proper; but if discolored, that is, if they differ from their natural color, it must be particularised. 10. When three figures are in a field, and their position is not mentioned in the blazoning, they are always understood to be placed two above, and one below.

11. When there are many figures of the same species borne in a coat of arms, their number must be observed as they stand, and distinctly expressed.

There are other positions called irregular; as, for example, when three figures, which are naturally placed two and one, are disposed one and two, &c. It must also be observed, that when the field is strewed with the same figures, this is expressed by the word semée; but if the figures strewed on the field are whole ones, it must be denoted by the words saus nombre; whereas, if part of them is cut off at the extremities of the escutcheon, the word semée is then to be used.

OF MARSHALLING COATS OF ARMS.

By marshalling coats of arms is to be understood the art of disposing divers of them in one escutcheon, and of distributing their contingent ornaments in proper places. Various causes may occasion arms to be thus conjoined, which J. Guillim comprises under two heads, viz. manifest, and obscure. What this learned and judicious herald means by manifest causes, in the marshalling of coats of arms, are such as betoken marriages, or a sovereign's gift, granted either through the special favor of the prince, or for some eminent services. Concerning marriages it is to be observed,

1. When the coats of arms of a married couple, descended of distinct families, are to be put together in one escutcheon, the field of their respective arms is conjoined pale-ways, and blazoned parted per pale, baron and femme, two coats; first, &c. In which case the baron's arms are always to be placed on the dexter side, and the femme's arms on the sinister side.

2. If a widower marry again, his late and present wife's arms are, according to G. Leigh, ' to be both placed on the sinister side, in the escutcheon, with his own, and parted per pale. The first wife's coat shall stand on the chief, and the second on the base; or he may set them both in pale with his own, the first wife's coat next to himself, and his second outermost. If he should marry a third wife, then the two first matches shall stand on the chief, and the third shall have the whole base. And if he take a fourth wife, she must participate one-half of the base with the third wife, and so will they seem to be so many coats quartered.' But these forms of impaling are meant of hereditary coats, whereby the husband stands in expectation of having the hereditary possessions of his wife united to his patrimony. If a man marry a widow, he marshals her maiden arms only.

3. In the arms of femmes joined to the paternal coat of the baron, the proper differences by which they were borne by the fathers of such femmes must be inserted.

4. If a coat of arms that has a bordure be impaled with another, as by marriage, then the bordure must be wholly omitted in the side of the arms next the centre.

5. The person who marries an heiress, instead of impaling his arms with those of his wife, is to bear them in an escutcheon placed in the centre of his shield, and which, on account of its showing forth his pretension to her estate, is called an escutcheon of pretence, and is blazoned sur tout, i.e. over all. But the children are to bear the hereditary coat of arms of their father and mother quarterly, which denotes a fixed inheritance, and so transmit them to posterity. The first and fourth quarters generally contain the father's arms, and the second and third the mother's ; unless the heirs should derive not only "ieir estate, but also their title and dignity, from their mother.

6. If a maiden or dowager lady of quality marry a commoner, or a nobleman inferior to her rank, their coats of arms may be set beside one another in two separate escutcheons, upon one mantle or drapery, and the lady's arms ornamented according to her title.

7. Archbishops and bishops impale their arms differently from the forementioned coats, in giving the place of honor, that is, the dexter side, to the arms of their dignity. Prelates thus bear their arms parted per pale, to denote their being joined to their cathedral church in a sort of spiritual marriage.

With respect to such armorial ensigns as the sovereign thinks fit to augment a coat of arms with, they may be marshalled various ways, as may be seen by the arms of his grace the duke of Rutland and many others. So far the causes for marshalling divers arms in one shield, &c., are manifest. As to such as are called obscure, that is when coats of arms are marshalled in such a manner that no probable reason can be given why they are so conjoined, they must be left to heralds to explain.

OF THE ORDERS OF KNIGHTHOOD, &c.

'To the augmentations above mentioned may be added,

1. The baronet's mark of distinction, or the arms of the province of Ulster in Ireland, granted and made hereditary in the male line by king James I., who erected this dignity on the 22d of May, 1611, in the seventh year of his reign, in order to propagate a plantation in the fore-mentioned province. This mark is—Argent, a sinister hand couped at the wrist, and erected gules; which may be borne either in a canton, or in an escutcheon, as will best suit the figures of the arms.

2. The ancient badge of the most noble order of the garter, instituted by king Edward III., 1349, in the twenty-seventh year of his reign. This honorable augmentation is a deep blue garter, surrounding the arms of such knights, and inscribed with this motto—⁴ Honi soit qui mal y pense.³

The arms of those who are knights of the orders of the Bath, of the Thistle, or of St. Patrick, are marshalled in the same manner, with this difference only, that the color and motto accord with the order to which it belongs. Thus the motto, 'Quis separabit, 1783,' on the light blue riband of the order, surrounds the escutcheon of a knight of St. Patrick. 'Nemo me impune lacesset,' on a green riband, distinguishes a knight of the Thistle; and 'Tria juncta in uno,' on red, a knight of the Bath. None of these orders of knighthood are hereditary; but the honors of a baronet of Ulster, and of a baronet of Nova Scotia, (created by patent in 1602), descend to the heirs male.

For representations of the badges of the several orders of knighthood, see plate V.

The following table will shew the order of precedency observed at public solemnities, &c.

The King. Prince of Wales. King's Sons. King's Grandsons. King's Brothers. King's Uncles. King's Nephews. Husbands of the King's Daughters. Archbishop of Canterbury, Lord-Primate of England. Lord High Chancellor, Lord Keeper, being a Baron. Archbishop of York, Primate of England. Lord High Treasurer. Lord President of the Privy Council. Lord Privy Seal. Lord Great Chamberlain. Lord High Constable. Earl Marshal. Lord High Admiral. Lord Steward of His Majesty's Household. Lord Chamberlain of His Majesty's Household. Dukes according to their Patents. Eldest Sons of Dukes of the Blood Royal. Marquises according to their patents. Dukes' eldest sons. Earls according to their patents. Younger Sons of Dukes of the Blood Royal. Marquises' eldest sons. Dukes' younger sons. Viscounts according to their patents. Earls' eldest sons. Marquises' younger sons. Bishops of London, Durham, Winchester, and all other bishops, according to their seniority of creation. Secretary of State, being a Baron. Commissioners of the Great Seal. Barons according to their patents. Speaker of the House of Commons. Treasurer, Comptroller, and Vice-Chamberlain of the Household. Secretary of State, being under the degree of a Baron. Viscounts' eldest sons. Earls' younger sons. Barons' eldest sons. Knights of the Garter. Privy Councillors. Chancellor of the Exchequer. Chancellor of the Duchy of Lancaster. Lord Chief-Justice of the King's Bench. Master of the Rolls. Lord Chief-Justice of the Common Pleas. Lord Chief Baron of the Exchequer. Judges and Barons of the degree of the coif of the said court, according to seniority. Bannerets made by the King himself in person. Viscounts' younger sons. Barons' younger sons. Baronets. Bannerets not made by the King himself in person. Knights of the Thistle. Grand Crosses. Knights of the Bath.

Knights Commanders of the Bath. Companions of the Bath. Knights Bachelors. Eldest sons of the youngest sons of Peers. Baronets' eldest sons. Eldest sons of Knights of the Garters. Bannerets' eldest sons. Eldest sons of Knights of the Thistle and Baths. Knights' eldest sons. Baronets' younger sons. Esquires of Knights of the Bath. Esquires by Creation. Esquires by Office. Younger sons of Knights of the Garter. Younger sons of Bannerets. Younger sons of Knights of the Bath. Younger sons of Knights Bachelors.

Gentlemen.

OF FUNERAL ESCUTCHEONS.

We shall conclude this treatise by describing the several funeral escutcheons, usually called hatchments; by which may be known, after any person's decease, what rank he or she held when living; and, if it be a gentleman's hatchment, whether he was a bachelor, married man, or widower, with the like distinctions for gentlewomen.

The hatchment is usually affixed to the fronts of houses, when any of the nobility or gentry die. 1. The arms, if the deceased be a private gentleman, are parted per pale with those of his wife. The ground without the escutcheon being black denotes the man to be dead; and the ground on the sinister side being white signifies that the wife is living.

When a married gentlewomen dies first, the hatchment is distinguished by contrary color from the former; that is, the arms on the sinister side have the ground without the escutcheon black; whereas those on the dexter side, for her surviving husband, are upon a white ground: the hatchment of a gentlewoman is, moreover, differenced by a cherub over the arms instead of a crest.

When a bachelor dies, his arms may be depicted single or quartered, with a crest over them, but never impaled, as the two first are, and all the ground without the escutcheon is also black.

When a maid dies, her arms, which are placed in a lozenge, may be single or quartered, as those of a bachelor; but, instead of a crest, have a cherub over them, and all the ground without the escutcheon, is also black.

When a.widower dies, his arms are represented impaled with those of his deceased wife, having a crest and sometimes a helmet and mantling over them, and all the ground without the escutcheon black.

When a widow dies, her arms are also represented impaled with those of her deceased husband, but enclosed in a lozenge, and, instead of a crest, a cherub is placed over them; all the ground without the escutcheon is also black.

If a widower or bachelor should happen to be the last of the family, a mort-head is generally annexed to each hatchment, to denote that death has conquered all. By the forementioned rules, which are sometimes neglected through the ignorance of illiterate people, may be known, upon the sight of any hatchment, what branch of the family is dead; and by the helmet, coronet, &c., what title and degree the deceased person held. The same rules are observed with respect to the escutcheons placed on the hearse and horses used in pompous funerals, except that they are not surmounted with any crest, as in the foregoing examples of hatchments, but are always plain. It is necessary, however, to ensign those of peers with coronets, and that of a maiden lady with a knot of ribands.

In Scotland a funeral escutcheon not only shows forth the arms and condition of the defunct, but is also a proof of the gentility of his descent; and such persons, for whom this species of escutcheon can be made out, are legally entitled to the character of gentlemen of blood,

HERALDUS (Desiderius), or Didier Herault, a counsellor of the parliament of Paris, of uncommon learning. His Adversaria appeared in 1599; which, however, if the Scaligerana may be credited, he repented having published. Ifis notes on Tertullian's Apology, on Minutius Felix, and on Arnobius, have been esteemed. He also wrote notes on Martial's Epigrams. Under the name of David Leidhresserus, he wrote a political dissertation on the independence of kings, some time after the death of Henry IV. He had a controversy with Salmasius, De jure Attico ac Romano; but did not live to finish what he had written on that subject. What he had done, however, was printed in 1650. He died in June 1649.

HERALDUS, OF HERAULT, SON to Desiderius, was a minister in Normandy, when he was called to the service of the Walloon church of London under Charles I. He wrote a work entitled Pacifique Royal en deuil, in which he condemned the execution of king Charles I. It is quoted by Daille. He was so zealous a royalist that he was forced to fly to France, to escape the fury of the republicans. He returned to England after the Restoration, and resumed his ministry in the Walloon church at London: some time after which he obtained a canonry in the cathedral of Canterbury, which he enjoyed till his death.

HERAT, the ancient Aria, a city of Persia, in the province of Khorassan, is on the high road from Persia to Hindostan, and on the west frontier of Afghaunistaun. It has been taken by all the great conquerors of the east, from Alexander to Nadir Shah. At the beginning of the sixteenth century it was at the height of its modern splendor, and the residence of Aboul Ghazy, the fourth in descent from Timour. It is now the head of a viceroyalty of Cabul. In 1783 Mr. Forster describes it as very commercial, and having an excellent manufacture of carpets. Good horses are bred in the vicinity, and its revenues have been reckoned at 4,000,000 rupees.

HERAULT, DEPARTMENT OF (in France), is part of the former province of Languedoc, and which is the highest species of gentility. The English hatchment, above described, exhibits no more than a right to a coat of arms, which may be acquired by purchase, and is only the first step towards establishing gentility in a family.

HERALDS, COLLEGE OF, OF HERALDS' OFFICE, a corporation founded by a charter of king Richard III., who granted them several privileges, as to be free from subsidies, tolls, offices, &c. They had a second charter from king Henry VI.; and a house built near Doctors' Commons, by the earl of Derby, in the reign of king Henry VII. was given them by the duke of Norfolk, in the reign of queen Mary I., which house is now rebuilt. This college is subordinate to the earl marshal of England. They are assistants to him in the court of chivalry, usually held in the common hall of the college, where they sit in their rich coats of his majesty's arms.

derives its name from the river Herault, which traverses it from north to south in its way to the Mediterranean Sea. The chief place of this prefecture is Montpelier: it is divided into four arrondissements, or subprefectures, viz. Montpelier 111,656 inhabitants, Beziers 117,279, Lodève 52,893, and St. Pons 42,298, making a total of 324,126 souls. It contains thirty-six justiciaries of the peace, or cantons, and 333 communes, spread over an area of 951 square miles, and yields a territorial revenue of 21,580,000 francs. It is the ninth military division of the kingdom; has a royal court and bishopric at Montpelier, consists of three electoral circles, and sends five members to the chamber of deputies. It is bounded on the north and east by the department of the Gard, on the south-east by the Mediterranean, on the south-west by the department of Aude, and on the north-west by those of Aveyron and Farn.

The surface of this maritime department is much diversified; it is intersected by mountains and valleys, plains and forests; the soil is generally dry and barren, and with difficulty produces corn ; but, to make amends, it yields abundance of excellent wines, especially Muscadel and Frontigniac, a great number of plants suitable for medicine, dyeing, and perfumery, and a vast quantity of fruits of every kind. The country is covered with olive, almond, and figtrees; the gardens are filled with orange trees, citrons, and pomegranates, which present at all seasons a constant succession of flowers and fruits. There are also some fine forests of oaks, which furnish wood for ship-building and cooperage; the pastures are abundant and always green, and its artificial meadows have been very much increased. One branch of the Cevennes crosses this department in a direction nearly parallel with the coast; in some places the old craters of volcanoes are discernible, and we perceive some masses of basalt, lava, and other volcanic stones. The heights present nothing, so to speak, but uncultivated rocks, where, however, there are some green oaks, box trees, thyme, and lavender.

The pools or lakes of Thau, Frontignan, Magnelone, Perault, and Manguio, which extend over a great space, and communicate with each other by several canals, occupy a considerable part of the coast of this department. They abound in fish of every kind; and produce annually about 23,700 quintals of white fish, 7550 of eels, 45,000 of shell fish, and 15,000 ducks and other aquatic birds, yielding in the whole 560,000 francs, three-fifths of which arise from the pools worked for the advantage of the state.

The soil is generally rich, and is cultivated with horses; but its products are insufficient for the population, since a large portion of the country consists of forests of oak, beech, chestnut, pine, box trees, and green oaks, and auother large portion is full of vineyards. The average large portion is full of vineyards. produce of a hectar of arable land, is 27 francs 17 centimes. It yields little corn; but more than 2,000,000 of hectolites of wine are made every year, of which three-fourths are distilled and exported; it produces also a great quantity of fruit, a number of artificial meadows, almonds, nuts, olives, figs, oranges, citrons, capers, melons (in the open field), camphire, kali, woad, and pastel. Numbers of cattle and sheep are reared in this country, and great quantities of silk-worms; there is also an extensive pilchard fishery, and quarries of marble of different colors; alabaster, limestones, brown free-stone, potters' clay, fossil cinders, aluminous earths, &c. There are establishments for mineral waters at Avêne, at Balaruc, and la Malou.

In this department are manufactured cloths for soldiers' dresses, which are exported to Spain and the Levant, woollen and cotton counterpanes, swansdowns, silk and grogram caps, staves, casks, cork, paper, mineral acids, dry and mixed verdigris, Spanish nut oil, soap, fine liqueurs, scented waters, perfumery, grape syrup, and confectionary. There are also brandy distilleries; refining houses for sugar; silk, cotton, and woollen spinning factories ; steel manufactories ; glasshouses for window glass and bottles; considerable tan-houses, salt-pits, &c. An extensive commerce is carried on in corn, muscadel, and other wines, brandy, spirits, oil, dry and preserved fruits, plants, soap, spices, drugs, verdigris, chemical productions, skins, leather, and It is a great market for salt, and carries cattle. on an import and export trade with almost every port in Europe, America, and the Indies.

The principal rivers which water the country are the Herault and the Lez, which are both navigable, the Ergue, the Mosson, the Salaison, the Orb, the Libron, and the Cesse; the canal in the south, which joins the Mediterranean and the Atlantic, the canal of Grave which communicates with the lakes and the sea by means of the Lez, the canal of Roubine or Lunel, and that of Montpelier. It is traversed by the great roads from Nismes and Perpignan.

HERAULT, a river which takes its rise in the Cevennes, at the foot of the lofty mountains of Aigaoual, and Lespiron, near the village of Valleraugue, in the circle of Vigan, department of the Gard. It passes by Valleraugue, near Ganges, to St. Bauzil, St. Etienne, St. Guilhem-le-Désert near Aniane and Gignac, to Pezenas and

Bessan, and falls into the Mediterranean at the port of Agde, where it forms a channel. Its whole course is about eighty-four miles. As far as St. Guilhem, this river flows through a deep trench of calcareous rock; it is navigable from Bessau to its mouth. Its principal tributary streams are the Ergue, the Dombic, and the Peine.

HERAULT. See HERALDUS

HERB, n. s. HERBA'CEOUS, adj. HER'BAGE, n. s. HER'BAL, n. s. HER'BALIST, n. s. HER'BAR, n. s. HER'BARIST, n. s. HER'BELET, n. s. HERBES'CENT, adj. HER'BID, adj. HER'BORIST, n. s. HER'BOROUGH, n. s. HER'BOUS, adj. HER'BULENT, adj. HERB'-WOMAN, n.s. HER'BY, adj.

Fr. herbe; Lat. herba; Germ. herberg. The generic name of plants: herbaceous, feeding on vegetables: herbage, pasture, or the right of pasture : herbal, a book containing names and descriptions of plants: herbalist, a man skilled in the knowledge of herbs: herbar, synonymous with a plant: herbarist, one skilled in herbs: heebelet, a small herb: herbescent, growing into herbs: herbo

rough, a temporary residence, a harbour: herbous, herbulent, abounding with herbs: herbwoman, a woman that sells herbs: herby, having the nature of herbs.

Now cannot Canace but herbes delve Out of the ground; and maken salves newe Of herbes precious and fine of hewe. Chaucer. The Squieres Tale.

and in her hand

The herb she toke well avisand

The lefe, the sede, the stalke, the floure ;

And said it had a gode savcur

And was no common herb to find.

Chaucer's Dreame.

The Priores, as woman taught of gentil blood and hend.

Assented to hir counsel; and forth gone they wend,

Passing forth softly into the herbery,

For many a herb grewe for sewe (salve) and surgery. Chaucer. The Pardonere and Tapestere.

The roof hereof was arched over head,

And decked with flowers and herbars daintily.

Spenser. Faerie Queene. In such a night

Medea gathered the enchanted herbs

That did renew old Æson. Shakspeare.

These herbelets, which we upon you strow. Id. No substance but earth, and the procedures of earth, as tile and stone, yieldeth any moss or herby substance. Bacon.

We leave the description of plants to herbals and . other like books of natural history. Id.

The German lord, when he went out of Newgate into the cart, took order to have his arms set up in his last herborough. Ben Jonson.

Unhappy, from whom still concealed does lie Of herbs and roots the harmless luxury. Cowley.

There is a sort of stubborn weeds

Which if the earth but once, it ever breeds,

No wholcsome *herb* can near them thrive, No useful plant can keep alive. Id.

With sweet smelling herbs

Espoused Eve decked first her nuptial bed.

Milton.

As for the medicinal uses of plants, the large herbals are ample testimonies thereof More.

HER Such a plant will not be found in the herbul of na-Browne. ture.

Herbalists have distinguished them, naming that the male whose leaves are lighter, and fruit rounder. Id.

Ginger is the root of neither tree nor trunk; but an herbaceous plant, resembling the water flower-de-Id. luce

Herburists have exercised a commendable curiosity in subdividing plants of the same denomination.

Boyle.

Rocks lie covered with eternal snow ;

Thin herbage in the plains, and fruitless fields. Druden.

Herbs are those plants whose stalks are soft, and have nothing woody in them; as grass and hemlock. Locke.

He was too much swayed by the opinions then current amongst herburists, that different colours, or multiplicity of leaves in the flower, were sufficient to constitute a specifick difference. Ray.

A curious herbarist has a plant, whose flower perishes in about an hour. Id.

At the time the deluge came, the earth was loaded with herbage, and thronged with animals.

Woodward.

I was like to be pulled to pieces by brewer, butcher, and baker, even my herbwoman dunned me as I went along. Arbuthnot.

As to the fuci, their seed hath been discovered and shewed me first by an ingenious herbarist.

Derham.

Their teeth are fitted to their food ; the rapacious to catching, holding, and tearing their prey ; the herbaceous to gathering and comminution of vegetables. Id.

If the leaves are of chief use to us, then we call them herbs; as sage and mint. Watts's Logick.

Our herbals are sufficiently stored with plants. Baker.

One cultivated spot there was that spread

Its flowery bosom to the noon-day beam, Where many a rose-bud rears its blushing head,

And herbs for food with future plenty teem. Beattie.

Of herbs and cordials they produced their store, But she defied all they could employ, Like one life could not hold nor death destroy.

Byron. Don Juan.

HERB, in botany, is used by Linnæus to denominate that portion of every vegetable which arises from the root, and is terminated by the fructification. It comprehends, 1. The trunk, stalk, or stem. 2. The leaves. 3. Those minute external parts called by him the fulcra, or supports, of plants. 4. The buds, or, as he also terms them, the winter quarters of the future vegetable.

HERBACEOUS PLANTS are those which have succulent stems or stalks that lie down to the ground every year. Of herbaceous plants those are annual which perish stem and root every year; biennial, which subsist by the roots two years; perennial, which are perpetuated by their roots for a series of years, a new stem being produced every spring.

HERBAGE, in law, signifies the pasture provided by nature for the food of cattle; also the liberty to feed cattle in the forest, or in another person's ground.

HERBELOT (Bartholomew d'), a French writer, eminent for his oriental learning, born at

Paris in 1625. He travelled several times into Italy, where he obtained the esteem of some of the most learned men of the age. Ferdinand II., grand duke of Tuscany, gave him many marks of his favor: a library being exposed to sale at Florence, the duke desired him to examine the MSS, in the oriental languages, to select the best of them, and to mark the price; which being done, that generous prince purchased them, and made him a present of them. Colbert, being at length informed of Herbelot's merit, recalled him to Paris, and obtained a pension for him of 1500 livres : he afterwards became secretary and interpreter of the oriental languages, and royal professor of the Syriac tongue. He died at Paris in 1695. His principal work is entitled Bibliotheque Orientale, which he first wrote in Arabic and afterwards translated into French. It is greatly esteemed.

HERBERT (Edward), lord Herbert of Cherbury in Shropshire, an eminent English writer, born in 1581, and educated at Oxford. He travelled through Europe; and at his return was made knight of the Bath. James I. sent him ambassador to Louis XIII. in behalf of the protestants, who were besieged in several cities of France. He continued several years in this station. In 1625 he was created a baron by the title of lord Herbert of Castle Island; and, in 1631, by that of lord Herbert of Cherbury in On the breaking out of the civil Shropshire. wars he adhered to the parliament; and in 1644 obtained a pension, on account of his having been plundered by the king's forces. He wrote a History of the Life and Reign of Henry VIII. which was greatly admired ; a treatise De Veritate; and several other works. He died at London in 1648. 'Lord Herbert,' says Mr. Granger, stands in the first rank of the public ministers, historians, and philosophers of his age. It is hard to say whether his person, his understanding, or his courage, was the most extraordinary; as the fair, the learned, and the brave, But the same held him in equal admiration. man was wise and capricious; redressed wrongs, and quarrelled for punctilios; hated bigotry in religion, and was himself a bigot in philosophy.

Lord Herbert, in fact, was the advocate of a Natural Religion, an attention to which he conceived might supersede the uses of Revelation. He mentions an incident in connexion with the publication of his most celebrated work, which should not escape the modern impugners of miracles :- Being in his chamber, he says, doubtful as to the propriety of publishing his book, on one fair day in summer, his casement opening to the south, the sun shining clear, and no wind stirring, 'I took my book De Veritate in my hand, and, kneeling devoutly on my knees, said these words: 'O thou eternal God, author of the light which now shines upon me, and giver of all inward illuminations, I do beseech thee of thy infinite goodness to pardon a greater request than a sinner ought to make : I am not satisfied enough whether I shall publish this book De Veritate; If it be for thy glory, I beseech thee give me some sign from heaven, if not I shall suppress it.' I had no sooner spoke these words 190

but a loud, though yet gentle noise came from the heavens (for it was like nothing on earth), which did so comfort and cheer me, that I took my petition as granted, and that I had the sign demanded.' Of the truth of this narrative he makes the most solemn assertions, and there is no reason to doubt that he fully believed it.

HERBERT (George), an English poet and divine, brother to Edward, was born in 1593, and educated at Cambridge. In 1619 he was chosen public orator of that university, and afterwards obtained a sinecure from the king. In 1626 he was appointed prebendary of Leighton Bromswold, in the diocese of Lincoln, and in 1630 rector of Bemerton, near Sarum. The great lord Bacon had such an opinion of his judgment, that he would not suffer his works to be printed before they had passed his examination. He wrote a volume of devout poems, called The Temple, and a prose work, entitled The priests to the Temple, or The Country Parson, &c. He died about 1635.

HERBERT (Mary), countess of Pembroke, sister of the famous Sir Philip Sidney, and wife of Henry earl of Pembroke. She was not only a lover of the Muses, but a great encourager of polite literature. Her brother dedicated his Arcadia to her. She translated a dramatic piece from the French, entitled Antonius, a tragedy. She also turned the Psalms of David into English metre; but it is doubtful whether these works were ever printed. She died in 1621. The following well known epitaph was written on her by Ben Jonson:—

> Underneath this sable hearse Lies the subject of all verse, Sidney's sister, Pembroke's mother : Death! ere thou hast killed another, Fair, and good, and learn'd as she, Time shall throw a dart on thee.

HERBERT (William), a modern bibliographical writer, was a native of Hertfordshire, and was educated at Hitchin. He carried on trade for some years as a hosier, in London; and subsequently went out to the East Indies as a purser's clerk. Here he employed his time in making charts and plans of the coasts and harbours, for which he obtained a handsome acknowledgment from the East India Company on his return. He then commenced business as a map and print seller, in which he was so successful as to be enabled to purchase an estate at Cheshunt. He now reprinted Sir Robert Atkyns's History of Gloucestershire: but his chief literary labor was an edition of Ames's Typographical Antiquities; or Account of the Origin and Progress of Printing in Great Britain and Ireland, considerably augmented, 1785-1790, 3 vols. 4to. He died at Cheshunt in 1795, aged seventysix.

HERBINIUS (John), a native of Birschen in Silesia, born in 1632. He wrote a work entitled De Statu Ecclesiarum Augustanæ Confessionis in Poloniâ; 4to., 1670: and several curious tracts on cataracts and waterfalls, also in Latin. He died in 1676, aged forty-four.

HERBORN, a town of Germany, on the Dill, in the duchy of Nassau. Here is a celebrated high school, founded in 1584, which has the privileges of a university; and an academy having four teachers. Population 2400. Three miles S. S. E. of Dillenburg.

HERBST (John Frederick William), a German entomologist, was born November 1st 1743, at Petershagen, in the principality of Minden; After having been for some years a teacher at Berlin he obtained the situation of almoner to a Prussian regiment; and, his talents becoming known, he was appointed preacher in severa. churches of Berlin. He is, however, principally known as a naturalist; was director of the society of Friends of Natural History at Berlin; of the Royal Academy of Bavaria at Burghausen; and of the Economical Society of Potsdam. His death took place November 5th 1807. He was the author of treatises on the natural history of crustaceous animals, insects, worms, scarabæi, butterflies, and apterous insects; all which works were published collectively at Berlin, 1785-1804, under the title of a Natural System of all the known Insects, indigenous and exotic, with plates. Collections of his sermons have also been published.

HERCULANEUM, an ancient city of Campania in Italy, which together with Pompeii was destroyed by an eruption of Vesuvius in the first year of the emperor Titus, or the seventyninth of the Christian era, and lately rendered famous on account of the curious monuments of antiquity discovered in its ruins: of these we purpose giving a detailed account under the article POMPETI AND HERCULANEUM.

The epocha of the foundation of Herculaneum is unknown. Dionysius Halicarnassensis conjectures that it may be referred to sixty years before the war of Troy, or about A. A. C. 1242; and therefore that it lasted about 1300 years. The thickness of the heap of lava, by which the city was overwhelmed, has been much increased by fiery streams vomited since that catastrophe; and now forms a mass twenty-four feet deep of dark gray stone, which is easily broken to pieces. The precise situation of this subterraneous city was not known till 1713, when it was accidentally discovered by some laborers, who, in digging a well, struck upon a statue on the benches of the theatre. Many others were afterwards dug out, and sent to France by the prince of Elbœuf. But little progress was made in the excavations till Charles, infant of Spain, ascended the Neapolitan throne, by whose unwearied efforts and liberality a very considerable part of Herculaneum was explored. A large portion of these relics is deposited in a museum at Porteci, and in the royal palace at Naples. Of these the most valuable are doubtless the MSS., which are all however calcined, and a number of them, when exposed to the air, sunk to dust. Among the 1800 preserved, it has long been expected that some of the missing classics may be found. Those first examined were Greek; but a portion of them have been found to be in Latin. A plan for unrolling these MSS. was first invented by a Neapolitan monk; and his present majesty, when prince of Wales, undertook to defray the expense of this proceeding, and sent out Mr, Hayter, an English clergyman, to superintend it.

See HAYTER. But in 1806 the occupation of Naples by the French stopped his labors, the fruits of which were presented by the prince regent to the university of Oxford: no distinct account of them has as yet been given to the public. See POMPELI.

HERCULES, in fabulous history, a renowned hero, who after death was ranked among the gods, and received divine honors. According to the ancients, there were many persons of this name. Diodorus mentions three, Cicero six, and some Greek authors enumerate forty-three, either because several persons thought to do themselves honor by assuming this name, or, perhaps, because Hercules was not a proper name, but an appellative, derived, as Le Clerc conjectures, from the Phænician word Harokel, merchant; and this learned author alleges, that the name was formerly given to the famous traders who migrated for the discovery of new countries, and for planting colonies there, and who frequently signalised themselves by clearing them of the wild beasts, &c. Of all these, one generally called the Theban Hercules is the most celebrated; and to him the actions of the others have been attributed. He is reported to have been the son of Jupiter by Alcmena (wife to Amphitryon, king of Argos), whom Jupiter enjoyed in the shape of her husband, while he was absent. Amphitryon, having soon after accidentally killed his uncle and father-in-law Electryon, was obliged to fly to Thebes, where Hercules was born. The jealousy of Juno prompting her to destroy the infant, she sent two serpents to kill him in the cradle, but young Hercules strangled them both. He was early instructed in the liberal arts : Castor, the son of Tyndarus, taught him to fight; Eurytus, to shoot; Autolycus to drive a chariot; Linus to play on the lyre; and Eumolpus to sing; while the instructions of Chiron, the centaur, rendered him the most valiant and accomplished hero of the age. In his eighteenth year he delivered the neighbourhood of Mount Cithæron from a huge lion, which preyed on the flocks of Amphitryon, and laid waste the adjacent country. He went to the court of Thespius, king of Thespes, who shared in the general calamity, by whom he was hospitably entertained for fifty days; during which time, or as some say even in one night, he debauched the king's fifty daughters. He next delivered his country from the tribute of 100 oxen, annually paid to Erginus. Such public services became universally known; and Creon, king of Thebes, rewarded his patriotic deeds by giving him his daughter in marriage, and entrusting him with the government. Enrystheus, the son of Amphitryon, having succeeded his father, became jealous of Hercules; and, lest he should deprive him of his crown, left no means untried to get rid of him. On this, Hercules consulted the oracle; but, being answered that it was the pleasure of the gods that he should serve Eurystheus twelve years, he fell into a deep melancholy, which at last ended in a furious madness; during which, among other desperate actions, he put away his wife Megara, and murdered all the children he had by her. As an explation of this crime, the king

imposed upon him twelve labors, surpassing the power of all other mortals to accomplish, which, nevertheless, our hero performed with ease, the favors of the gods having indeed completely armed him. He had received a coat of armour and helmet from Minerva, a sword from Mercury, a horse from Neptune, a shield from Jupiter, a bow and arrows from Apollo, and from Vulcan a golden cuirass and brazen bus-kin, with a celebrated club of brass. His first labor was the killing of a lion in Nemæa, a wood of Achaia; whose hide was proof against any weapon, so that he was forced to seize him by the throat and strangle him. He carried the dead beast on his shoulders to Mycenæ, and ever after clothed himself with the skin. Eurystheus was so astonished at the sight of the beast, and at the courage of Hercules, that he ordered him never to enter the gates of the city when he returned from his expeditions, but to wait for his orders without the walls. He even got a brazen vessel made, into which he retired whenever Hercules returned. The second labor was to destroy the Lernæan hydra, which had seven heads according to Apollodorus, fifty according to Simonides, and 100 according to Diodorus. This monster he first attacked with his arrows ; but soon after, by means of his heavy club, he destroyed the heads of his enemy. This, however, was productive of no advantage; for as soon as one head was beaten to pieces by the club, two sprang up; and the labor of Hercules would have remained unfinished, had not he commanded his friend Iolaus to burn with a hot iron the root of the head which he had crushed to pieces. This succeeded; and Hercules became victorious, opened the belly of the monster, and dipped his arrows in the gall, to render the wounds they should give incurable. He was ordered in his third labor to bring alive and unhurt into the presence of Eurystheus a stag, famous for its incredible swiftness, its golden horns, and brazen feet. This celebrated animal frequented the neighbourhood of (Enoe; and Hercules was employed for a whole year in pursuing it; at last he caught it in a trap, when tired. The fourth labor was to bring alive to Eurystheus a wild boar which ravaged the neighbourhood of Erymanthus. In this expedition he destroyed the centaurs, and caught the hoar by closely pursuing him through the deep snow. Eurystheus was so frightened at the sight of the hoar, that, according to Dio-dorus, he hid himself in his brazen vessel for some days. In his fifth labor Hercules was ordered to cleanse the stables of Augeas, where 3000 oxen had been confined for many years. For his sixth labor he was ordered to kill the carnivorous birds which ravaged the country near the lake Stymphalus in Arcadia. In his seventh labor he caught alive, in the Peleponnesus, a prodigious wild bull, which laid waste the island of Crete. In his eighth labor he was employed in obtaining the mares of Diomedes, king of Thrace, which fed upon human flesh. He killed Diomedes, and gave him to be eaten by his mares, which he brought to Eurystheus, who sent them to Mount Olympus, where they were devoured by wild beasts;

though some say they were consecrated to Jupiter, and that a breed of them still existed in the age of Alexander the Great. For his ninth labor, he was commanded to obtain the girdle of the queen of the Amazons. In his tenth labor he killed the monster Geryon, king of Gades, and brought to Argos his numerous flocks, which fed upon human flesh. This was in Iberia or Spain; in the furthest parts of which he erected his two pillars as the utmost limits of the then known world. These ten labors he achieved in about eight years. In this fast expedition he likewise killed Antæus, a monstrous giant, who, when weary with wrestling or labor, was immediately refreshed by touching his mother the Earth. Hercules overcame him in wrestling,. and slew him; and after him the tyrant Busiris, king of Egypt, who used to sacrifice all strangers upon his altars; but was slain by Hercules, with all his attendants. His eleventh labor was the carrying away the Hesperian golden apples The kept by a dragon. See HESPERIDES. twelfth and last, and most dangerous of his labors, was to bring up to the earth the three-headed dog Cerberus. Descending into hell by a cave on mount Tænarus, he was permitted by Pluto to carry away his friends Theseus and Pirithous, who were condemned to punishment in hell, and Cerberus also was granted to his prayers, provided he made use of no arms to drag him away. Hercules carried him back to hell after he had brought him before Eurystheus. Many other exploits were performed by Hercules. He accompanied the Argonauts to Colchis before he delivered himself up to Eurystheus. He assisted the gods in their wars against the giants, and it was through him that Jupiter obtained the victory. He conquered Laomedon, and pillaged Troy. When Iole, the daughter of Eurytus king of Echalia, of whom he was deeply enamoured, was refused to his entreaties, he fell into a second fit of insanity, and murdered Iphitus, the only one of the sons of Eurytus who favored his addresses to Iole. He was afterwards purified of the murder, and his insanity ceased; but he was visited by a disorder which obliged him to apply to the oracle of Delphi for relief. The coldness with which the Pythia received him irritated him, and he resolved to plunder Apollo's temple, and carry away the sacred tripod. Apollo opposed him, and a severe conflict was begun, which nothing but the interference of Jupiter could have settled. He was upon this told by the oracle that he must be sold as a slave, and remain three years in the most abject servitude to recover from his disorder. He complied, and Mercury, by order of Jupiter, conducted him to Omphale, queen of Lydia, to whom he was sold as a slave. Here he cleared all the country from robbers; and Omphale, astonished at the greatness of his exploits, married him. Hercules had Agelaus and Lamon by Omphale, from whom Cræsus king of Lydia was descended. He became also enamoured of one of Omphale's female servants, by whom he had Alcœus. After he had completed the years of his slavery, he returned to Peloponnesus, where he restored to the throne of Sparta Tyn-

darus, who had been expelled by Hippocoon. He became one of Dejanira's suitors, and, after overcoming all his rivals, married her. He was obliged to leave his father-in-law's kingdom Calydon, because he had inadvertently killed a man with a blow of his fist; and on this account he was not present at the hunting of the Calydonian boar. From Calydon he retired to the court of Ceyx king of Trachina, who received him and his wife with great marks of friendship, and purified him of the murder which he had committed at Calydon. He next made war against Eurytus, who had refused him his daughter lole, and killed him with three of his sons. Iole fell into his hands, and accompanied him to mount Œta, where he intended to offer a solemn sacrifice to Jupiter. As he had not then the shirt and tunic in which he sacrificed, he sent Lichas to Trachin to Dejanira, to provide him a proper dress. Dejanira had some time before been attempted by the Centaur Nessus, as he was ferrying her over the river Evenus; and Hercules, beholding it from the shore, had mortally wounded him with one of his poisoned arrows. Nessus finding himself dying, advised her to mix some oil with the blood which flowed from his wound, and to anoint her husband's shirt with it, pretending that it would infallibly secure him from loving any other woman; and she, apprized of his inconstancy, had actually prepared the poisoned ointment accordingly. Lichas, coming to her for the garments, acquainted her with his having brought away Iole; upon which she anointed his shirt with the fatal mixture. This had no sooner touched his body than he felt the poison diffused through his veins; the violent pain of which made him disband his army, and return to Trachin. His torment increasing, he sent to consult the oracle for a cure; and was answered, that he should cause himself to be conveyed to mount Eta, and there rear up a pile of wood, and leave the rest to Jupiter. Having obeyed the oracle, and his pains becoming intolerable, he dressed himself in his martial habit, flung himself upon the pile, and desired the bystanders to set fire to it; or, as others say, his son Philoctetes, who, having performed his fa-ther's command, had his bow and arrows given him as a reward. At the same time Jupiter sent a flash of lightning, which consumed both the pile and the hero; Iolaus, coming to take up his bones, found nothing but ashes; from which it was concluded, that he was gone to heaven, and admitted among the gods. His friends raised an altar where the burning pile had stood ; and Menœtius the son of Actor sacrificed a bull, a wild boar, and a goat; and enjoined the people of Opus to observe these ceremonies annually. His worship soon became as universal as his fame; and Juno, forgetting her resentment, gave him her daughter Hebe in marriage. Hercules has many surnames, from the places where his worship was established, and from the labors he had achieved. His temples were numerous and magnificent, and his divinity revered. No dogs or flies entered his temple at Rome: and that cf Gades, according to Strabo, was always forbid-den to women and pigs. The Phœnicians offered quails on his altars; and, as he was

supposed to preside over dreams, the sick and infirm were sent to sleep in his temples, that they might receive in their dreams the agreeable presages of their approaching recovery. The white poplar was particularly dedicated to his service. None even of the twelve great gods of antiquity have so many ancient monuments as Hercules. The famous statue of Hercules, in the Farnese palace at Rome, is well known to the connoisseurs. It represents him resting after the last of his twelve labors above recited, lean-ing on his club, and holding the apples of the Hesperides in his hand. In this statue, as in all the other figures of him, he is formed, by the breadth of his shoulders, the spaciousness of his chest, the largeness of his size, and firmness of his muscles, to express strength and a capacity of enduring great fatigue, which constituted the chief idea of virtue among the ancient heathens. His other attributes are his lion's skin, his club, and his bow. Hercules is represented by the ancients as an exemplar of virtue : however, the Hercules bibax, or drunken Hercules, is no uncommon figure; and his amours are described both by the poets and artists. Thus the Cupids are made to take away his club, and he is exhibited in the posture of bending under a little boy; by which is meant, that he who conquered all difficulties was a slave to love. His children were as numerous as the labors and difficulties which he underwent; and indeed they became so powerful soon after his death, that they alone had the courage to invade Peloponnesus. See HERACLIDÆ. The apotheosis of Hercules, or the establishment of his altars in the principal cities of Greece, is fixed by Thrasybulus twentynine years before the taking of Troy. Hercules has been honored by the Greeks by the name of Musagetes, the conductor of the Muses; and at Rome by that of Hercules Musarum. He is represented on medals with a lyre in his hand; and the reverse is marked with the figure of the nine Muses, with their proper symbols.

HERCULES, in astronomy, a constellation of the northern hemisphere. See ASTRONOMY.

HERCULES'S PILLARS, in ancient geography, two lofty mountains, one situated on the most Southern extremity of Spain, and the other on the opposite part of Africa. They were called ABYLA and CALPE (see those articles); were reckoned the boundaries of the labors of Hercules; and were fabled to have been joined toge-ther till they were severed by that hero, and a communication opened between the Mediterranean and Atlantic.

HERCYNA, a river of Bœotia, issuing from a rock in two streams, near the town of Livadia. One from its muddy appearance was called by the ancients by the name of Lethe or Oblivion; the other Mnemosyne, or Memory, being a small limpid stream.

HERCYNIA SILVA, the Hercynian Forest, in ancient geography, the largest of forests. Its breadth was a journey of nine days. From the limits of the Helvetii, Nemetes, and Rauraci, it extended along the Danube to the borders of the Daci and Anartes, a length of sixty days' jour-ney, according to Cæsar, who appears to have been well acquainted with its true breadth, as it Vol. XI. occupied all Lower Germany. It may therefore be considered as covering the whole of Germany; and most of the other forests may be considered as parts of it, though distinguished by particular names; consequently the Hartz, in the duchy of Brunswick, which gave name to the whole, was one of its parts. By the Greeks it was called Orcynius, a name common to all the forests in Germany; and Hercynius by the Romans; both from the German Hartz.

HERD, n. s., v. a. & v. n. Saxon people, Goth.herd; Swed. HERD'MAN, n. s. HERDS'MAN, n. s.

Sherde ; originally signifying a guard

or keeper, then the flock or thing guarded. A number of beasts together; a word peculiarly applicable to black cattle : a company of men, in contempt or detestation; anciently a keeper of cattle, as goatherd : herd, to run in companies ; to associate; to throw or put into a herd. The other words signify persons employed in keeping and tending herds; or the owners thereof.

Almighty Lord ! o Jesu Crist ! quod he, Sower of chast conseil ! hierde of us alle ! Chaucer. The Second Nonnes Tale.

'Ther n'as baillif, ne herde, ne other hine, That he ne knew his sleight and his covine. Id. Prologue to the Cant. Tales.

And many a floite, and litlyng horne, And pipes made of greene corne, As have these little herdegromes That kepen bestes in the bromes.

Id. The House of Fame.

But who shall judge the wager won or lost? That shall yonder herdgroom, and none other. Spenser.

And you, enchantment, Worthy enough a herdsman, if e'er thou These rural latches to his entrance open, I will devise a cruel death for thee.

Shakspeare.

Id.

Note a wild and wanton herd, Or race of youthful and unhandled colts, Fetching mad bounds.

The rest,

However great we are, honest and valiant, Are herded with the vulgar.

Ben Jonson's Catiline. Scarce themselves know how to hold

A sheephook, or have learned ought else the least That to the faithful herdman's art belongs.

Milton. There oft the Indian herdsman, shunning heat, Shelters in cool and tends his pasturing herds

At loop-holes cut through thickest shade. Id. A herdsman rich, of much account was he,

In whom no evil did reign, or good appear. Sidney.

So stands a Thracian herdsman with his spear Full in the gap, and hopes the hunted bear. Dryden.

The herdsmen, round

The chearful fire, provoke his health in goblets crowned. Id.

Survey the world, and where one Cato shines, Id. Count a degenerate herd of Catilines.

Weak women should, in danger, herd like deer. Id.

I do not remember where ever God delivered his oracles by the multitude, or nature truth by the herd. Locke.

0

HER

HER

When their herdsmen could not agree, they parted Id. by consent.

Run to towns, to herd with knaves and fools, And undistinguished pass among the crowd.

Walsh.

It is the nature of indigency. like common danger, to endear men to one another, and make them herd Norris. together, like fellow sailors in a storm.

There find a herd of heifers, wandering o'er The neighbouring hill, and drive them to the shore.

Addison.

I'll herd among his friends, and seem Id. Cato. One of the number.

I disdained to mingle with

A herd, though to be leader-and of wolves, The lion is alone, and so am I. Byron.

HERDER (John Godfrey), a German Lutheran divine, and moral philosopher, was a Prussian by birth, and obtained the office of Ecclesiastical superintendant-general of the duchy of Saxe Weimar. He was also first preacher to the court, and vice-president of the consistory. He distinguished himself by his writings on the belles lettres; but his works relative to Ethics and Intellectual Philosophy attracted most notice. The following are the titles of some of his works, Lays of Love, the oldest and most beautiful specimens of Oriental Poetry, with twenty-four ancient lays of the Minnesingers, Leipsic, 1778, 8vo.; Scattered Leaves, Gotha, 1791-1796, 6 vols, 12mo.; Letters on the Improvement of Human Nature, Riga, 1793-1796, 8 vols. 8vo.; Intellect and Experience ; a Meta-criticism on the Criticism of Pure Reason, i. e. the Philosophy of Kant, 1799, 2 vols. 8vo.; Popular Songs; Poems; Terpsichore, 3 vols. 8vo.; a treatise on the Origin of Language. But the work by which Herder is principally known in England is the Outlines of a Philosophy of the History of Man; of which a translation was published in London in 1800. He died in 1803; and a collection of his writings has since appeared in 26 vols. 8vo.

Your city, after the dreadful fire, was rebuilt, not presently, by raising continued streets; but at first here a house, and there a house, to which others by degrees were joined. Sprat's Sermons.

Since truths, absolutely necessary to salvation, are so clearly reveated that we cannot err in them, unless we be notoriously wanting to ourselves, *herein* the fault of the judgment is resolved into a precedent default in the will. South.

So near is the connection between the civil state and religious, that *heretofore* you will find the government and the priesthood united in the same person. Id.

"Tis the divinity that stirs within us;

'Tis Heaven itself that points out an hereafter,

And intimates eternity to man. Addison's Cato.

I saw hereabouts nothing remarkable, except Augustus's bridge. Id. on Italy.

I still shall wait

Some new hereafter, and a future state. Prior. However, friend, here's to the king, one cries;

To him who was the king, the friend replies. Id. If there he an hereafter,

And that there is conscience uninfluenced, And suffered to speak out, tells every man, Then must it be an awful thing to die,

More horrid yet to die by one's own hand.

Blair.

We now can form no more Long schemes of life, as *keretofore*. Swift. The acquisition of truth is of infinite concernment : *hereby* we become acquainted with the nature of things. Watts.

Here on the sharp spear mad with mortal pangs The bird transfixed in bloody vortex whirls, Yet fierce in death the threat'ning talon curls.

Beattie.

HERED'HTABLE, 'adj.` HEREDIT'AMENT, n. s. HERED'ITARY, adj. HERED'ITARILY, adv. HER'ITABLE, adv. HER'ITAGE, n. s.

Fr. hereditaire; Lat. hæres, hæredium. Whatever may be occupied as an inheritance: hereditament, a law term

denoting inheritance: hereditary, that which descends by right of inheritance; a birthright: heritable, whatever may be inherited: heritage, an inheritance or estate: in divinity, the people of God

O Lord, save thy people, and bless thine heritage. Common Prayer.

To thee and thine, hereditary ever Remain this ample third of our fair kingdom.

Shakspeare.

These old fellows

Have their ingratitude in them hereditary. Id. He shall ascend

The throne hereditary, and bound his reign. With earth's wide bounds, his glory with the heavens. Milton.

By the canon law this son shall be legitimate and heritable, according to the laws of England. Hale.

Thus while the mute creation downward bend Their sight, and to their earthly mother tend,

Man looks aloft, and with erceted eyes Beholds his own hereditary skies. Dryden's Ovid.

When heroic verse his youth shall raise, And form it to *hereditary* praise. Id. Virgil.

Adam being neither a monarch, nor his imaginary monarchy hereditable, the power which is now in the world is not that which was Adam's. Locke.

He considers that his proper home and *heritage* is in another world, and therefore regards the events of this with the indifference of a guest that tarries but a day. Rogers.

Here is another, who thinks one of the greatest glories of his father was to have distinguished and loved you, and who loves you *hereditarily*. Pope.

HEREDITARY DISEASES. The opinion that certain diseases, such as scrophula, gout, &c., are hereditary, has been held by physicians ever since the days of Hippocrates, and indeed seems to be confirmed by the experience of mankind in all ages and countries. Dr. Brown, in his Elem. Med., affirms, that, 'A taint, transmitted from parents to their offspring, and celebrated under the appellation of hereditary, is a mere tale, or there is nothing in the fundamental part of this (the Brunonian) doctrine. The sons of the rich, who succeed to their father's estate, succeed also to his gout : Those who are excluded from the estate, escape the disease also, unless they bring it on by their own conduct. Though Peter's father may have been affected with the gont, it does not follow that Peter must be affected; because, by a proper way of life, that is, by adapting his excitement to his stamina, he may have learned to evade his father's disease. If the same person, who, from his own fault and improper management, has fallen into the disease afterwards by a contrary management, and by taking good care of himself prevents and removes the disease, as it has been lately discovered, what then is become of the hereditary taint?'-Such is Dr. Brown's reasoning against the existence of hereditary diseases; but the fallacy of such arguments need scarcely be pointed out. To say, that because, by the use of medicines, or, what is in fact the same thing, by a strict regimen, a person may avoid a certain disease, he therefore inherits no taint or liability to such diseases, is indeed a bold assertion. The observations of every day afford fresh proof that the diseases of the father but too generally descend, with some modification, to the children, either in the shape of weakness, or illness, or, as is more frequently the case, of liability to the same.

HEREDITARY HONORS have been long esteemed useful in a well-governed state, as tending to excite a laudable ardor and generous emulation in acts of virtue and heroism. We shall only quote a judicious sentiment delivered by Dr. Watson, bishop of Llandaff, in the house of lords, upon a question respecting the Scotch peerage, in February 1787 :-- Whatever may be said of ancestry no man despises it, but he who has none to value himself upon; and no man will make it his pride, but he who has nothing better.'

HEREDITARY RIGHT, in the British constitution. The grand fundamental maxim upon which the jus coronæ, or right of succession to the throne of Britain depends, Sir William Blackstone takes to be this :—That the crown is, by common law and constitutional custom, hereditary; and this in a manner peculiar to itself: but that the right of inheritance may, from time to time, be changed or limited by act of parliament; under which limitations the crown still continues, hereditary. 1. The crown is in general hereditary, or descendible to the next heir, on the death of the last king. All regal governments must be either hereditary or elective *

02

195

and as there is no instance wherein the crown of England has ever been asserted to be elective, except by the regicides, on occasion of the trial of king Charles I., it must of consequence be hereditary. Yet, in thus asserting an hereditary right, a jure divino title to the throne is by no means intended. Such a title may be allowed to have subsisted under the theocratic establishments of the children of Israel in Palestine; but it never yet subsisted in any other country; save only so far as kingdoms, like other human fabrics, are subjected to the general and ordinary dispensations of Providence. Nor indeed have a jure divino and an hereditary right any necessary connexion with each other; as some have very weakly imagined. The hereditary right, which the laws of Britain acknowledge, owes its origin to the founders of our constitution, and to them This has been acquiesced in by general only. consent, and ripened by degrees into common law; the very same title that every private man has to his own estate. Lands are not naturally descendible, more than thrones: but the law has, for the benefit and peace of the public, established hereditary succession in the one as well as the other. It must be owned, an elective monarchy seems to be the most obvious, and best suited of any to the national principles of government, and the freedom of human nature; and accordingly we find from history, that, in the infancy and first rudiments of almost every state, the leader, chief magistrate, or prince, has usually been elective; and if the individuals who compose that state could always continue true to first principles, uninfluenced by passion or prejudice, unassailed by corruption, and unawed by violence, elective succession were as much to be desired in a kingdom as in other inferior communities. The best, the wisest, and the bravest man, would then be sure of receiving that crown which his endowments merited; and the sense of an unbiased majority would be dutifully acquiesced in by the few who were of different opinions. But history and observation inform us, that elections of every kind are too often brought about by influence, partiality, and artifice; and, even where the case is otherwise, these practices will be often suspected, and as constantly charged upon the successful, by a disappointed minority. This is an evil to which all societies are liable; as well those of a private and domestic kind, as the great community of the public, which regulates and includes the rest. But in the former there is this advantage, that such suspicions, if false, proceed no farther than jealousies and murmurs, which time will effectually suppress : justice may be remedied by legal means, by an appeal to those tribunals to which every member of society has virtually en-gaged to submit. Whereas, in the great and in-dependent society, which every nation composes, there is no superior to resort to but the law of nature; no method to redress the infringements of that law, but the actual exertion of force. As, therefore, between two nations, complaining of mutual injuries, the quarrel can only be decided by the law of arms; so in one and the same nation, when the fundamental principles of their common union are supposed to be invaded, and

more especially when the appointment of their chief magistrate is alleged to be unduly made, the only appeal that can be made is to the sword, and the only process by which the appeal can be carried on is that of a civil and intestine war. An hereditary succession to the crown is therefore now established, in this and most other countries, to prevent that periodical bloodshed and misery which the history of ancient imperial Rome, and the modern experience of Poland, show us to be the consequence of elective kingdoms. But, 2dly, as to the particular mode of inheritance. It in general corresponds with the feudal path of descents, chalked out by the common law in the succession to landed estates; yet with one or two material exceptions. Like them, the crown will descend lineally to the issue of the reigning monarch; as it did from king John to Richard II. through a regular pedigree of six lineal generations : as in them the preference of males to females, and the right of primogeniture among the males, are strictly adhered to. Thus Edward V. succeeded to the crown, in preference to Richard his younger brother, and Elizabeth his elder sister. Like them, on failure of the male line, it descends to the issue female; according to the ancient British custom remarked by Tacitus, solent fæminarum ductu bellare, et sexum in imperiis non discernere. Thus Mary succeeded to Edward V1; and the line of Margaret queen of Scots, the daughter of Henry VII. succeeded on failure of the line of Henry VIII. his son. But among the females, the crown descends by right of primogeniture to the eldest daughter only and her issue; and not, as in common inheritances, to all the daughters at once; the evident necessity of a sole succession to the throne having occasioned the royal law of descents to depart from the common law in this respect: and therefore queen Mary, on the death of her brother, succeeded to the crown alone, and not in partnership with her sister Elizabeth. Again, the doctrine of representation prevails in the descent of the crown, as it does in other inheritances; whereby the lineal descendants of any person deceased stand in the same place as their ancestor, if living, would have done. Thus Richard II. succeeded his grandfather Edward III. in right of his father the Black Prince, to the exclusion of all his uncles, his grandfather's younger children. Lastly, on failure of lineal descendants, the crown goes to the next collateral relations of the late king; provided they are lineally descended from the blood royal, that is, from that royal stock which originally acquired the crown. Thus Henry I. succeeded to William II.; John to Richard I.; and James I.to Elizabeth; being all derived from the Conqueror, who was then the only regal stock. But herein there is no objection (as in the case of common descents) to the succession of a brother, an uncle, or other collateral relation, of the half-blood; that is, where the relationship proceeds not from the same couple of ancestors (which constitutes a kinsman of the whole blood), but from a single ancestor only; as when two persons are derived from the same father and not from the same mother, or vice versa: provided only, that the one ancestor, from whom both are descended, be that from whose veins the blood-

royal is communicated to each. Thus Mary I. inherited to Edward VI., and Elizabeth inherited to Mary ; all born of the same father, king Henry VIII., but all by different mothers. See Con-SANGUINITY. 3. The doctrine of hereditary right does by no means imply an indefeasible right to the throne. No man will assert this, who has considered our laws, constitution, and history, without prejudice, and with any degree of attention. It is unquestionably in the power of the supreme legislative authority of this kingdom, the king and both houses of parliament, to defeat this hereditary right; and, by particular entails, limitations, and provisions, to exclude the immediate heir, and vest the inheritance in any one else. And this is so extremely reasonable, that without such a power, lodged somewhere, our polity would be very defective. For, let us barely suppose that the heir apparent should be a lunatic, an ideot, or otherwise incapable of reigning; how miserable would the condition of the nation be, if he were also incapable of being set aside ! It is therefore necessary that this power should be lodged somewhere; and yet the inheritance and regal dignity would be very precarious indeed, if this power were expressly and avowedly lodged in the hands of the subject only, to be exerted whenever prejudice, caprice, or discontent, should happen to take the lead. Consequently it can no where be so properly lodged as in the two houses of parliament, by and with the consent of the reigning king; who, it is not to be supposed, will agree to any thing prejudicial to the rights of his own descendants. And therefore, in the king, lords, and commons, in parliament assembled, our laws have expressly lodged it. 4. But fourthly, however the crown may be limited or transferred, it still retains its descendible quality, and becomes hereditary in the wearer of it. And hence, in our law, the king is said never to die in his political capacity; though, in common with other men, he is subject to mortality in his natural: because immediately upon the natural death of Henry, William, or George, the king survives in his successor. For the right of the crown vests. eo instanti, upon his heir; either the hæres natus, if the course of descent remains unimpeached, or the hæres factus, if the inheritance be under any particular settlement. So that there can be no interregnum; but, as Sir Matthew Hale observes, the right of sovereignty is fully invested in the successor by the very descent of the crown. And therefore, however acquired, it becomes in him absolutely hereditary, unless by the rules of the limitation it is otherwise ordered and determined : in the same manner as landed estates are, by the law, hereditary or descendible to the heirs of the owner; but still there exists a power, by which the property of those lands may be transferred to another person. If this transfer be made simply and absolutely, the lands will be hereditary in the new owner, and descend to his heir at law: but if the transfer be clogged with any limitations, conditions, or entails, the lands must descend in that channel, so limited and prescribed, and no other. See Succession.

HEREFORDSHIRE, a county of England,

whose name is derived from its chief place Hereford i. e. the Army's ford, from its being a strong frontier station of the Saxon and English forces toward Wales. At the period of the Roman invasion Herefordshire was inhabited by the Silures, who also occupied the adjacent counties of Radnor, Monmouth, and Glamorgan, together with that part of Gloucestershire which lies westward from the Severn. In the British language this district was called indifferently by the names of Esslwg Gwent, and Ercinna, words implying an open country of downs, abounding with prospects: hence its inhabitants were denominated Gwyr Esyllwg, Gwr Esyllyr, &c., and, from their derivatives, Syllyrwys.

This county is bounded on the north by Shropshire, on the north-east and east by Worcestershire, on the south-east by Gloucestershire, on the south-west by Monmouthshire, on the west by Brecknockshire, and on the north-west by Radnorshire. Its form is nearly an ellipsis; but some detached parishes are situated beyond the general outline: of these, Farlow is surrounded by Shropshire; Rochford is included in the county of Worcester; and Lytton Hill in that of Radnor : a considerable tract of land called Futhog, with a few acres on the Devandin Hill, is insulated by Monmouthshire. Its greatest extent, from Ludford on the north to the opposite border near Monmouth on the south, is thirty-eight miles. Its greatest width, from Clifford on the west to Cradley on the east, is thirty-five miles. It includes about 80,000 acres, and is divided into eleven hundreds, containing 221 parishes, one city, and six market-towns.

The general aspect of Herefordshire is extremely beautiful : its surface being finely diversified, and broken by swelling heights. From these elevations the prospects are extremely fine; but peculiarly so from the Malvern Hills on the east, and the Hatterell, or Black Mountain, on the west. The fertility of the soil is great; and the county is clothed in almost perpetual verdure. The courses of the rivers and brooks may be traced from any of the adjacent eminences by the rich lines of wood which skirt their margins: much valuable timber is also scattered over the county in hedge-rows, as well as on the sides and summits of the knolls and higher elevations. Every part seems uniformly productive; except, perhaps, on the northern and western outskirts. The general character of the soil is a mixture of marle and clay, containing a large proportion of calcareous earth. The substance is mostly limestone of different qualities; in some parts, particularly near Snodhill Castle, assuming the properties of marble, and becoming beautifully variegated with red and white veins. Towards the western borders the soil is cold, and retentive of moisture, but still argillaceous, with a base of soft crumbling stone, which decomposes on exposure to the atmosphere; or of nodules of impure limestone. The eastern side of the county is principally a stiff clay, of great tenacity and strength, and in many places of a red color; a great proportion of the hundred of Wormelow, on the south, is a light sand. Deep beds of gravel are occasionally met with in the vicinity of Hereford; and the sub-soil of several of the hills is of siliceous grit. Fullers'-earth is sometimes dug near Stoke; and red and yellow ochres, with tobacco-pipe-clay, are found in small quantities in different parts of the county. Iron ore has been met with in the parts bordering on Gloucestershire : but none has been dug of late years, though from the considerable quantities that have been discovered imperfectly smelted, and from the remains of hand-blomaries that have also been found, it has been thought that some iron works were established here as early as the Roman times.

Herefordshire is particularly famous as a cyder county; yet this, though a favorite object of its husbandry, is by no means the only one: cattle, sheep, swine, corn, hops, &c., have equally strong claims on the attention of the farmer. Plantations of fruit trees are found in every aspect, and in 'soil of every quality, and under every culture.' The most approved site is that which is open to the south-east, and sheltered in other points, but particularly in the opposite direction; for though Viigil and the other Roman poets celebrated the west wind as the most genial in Italy, and Philips, in his Poem on Cyder, recommended the same aspect,

the west, whose gentle warmth Discloses well the earth's all-teeming womb, Invigorating tender seeds ; whose breath Nurtures the orange and the citron groves, Hesperian fruits, and wafts their odors sweet Wide through the air, and distant shores perfumes,

it is an unquestionable fact, that the westerlywinds, and therefore a westerly exposure, are particularly unfavorable to the fruit trees of Herefordshire: they are more cold, as blowing over a considerable tract of the Welsh mountains, which are often covered with snow even late in the spring; and they are more unkind, because from that point proceeds a much more than equal proportion of those fogs and blue mists which Dr. Beale calls 'the disgusts of the Black Mountain.' This may be properly termed a woodland county; many species of trees growing up spontaneously, and becoming strong and vigorous in a very short period. The oak, elm, poplar, and willow, are particularly nourishing, but are seldom suffered to attain full maturity, unless on the estates of the nobility and most eminent landed proprietors. Coppicewood is extremely abundant, the sides and summits of many of the hills and upland grounds being covered with extensive plantations. The ash coppices are very valuable and numerous : those of the alder are also plentiful in low and marshy situations; the former are regulated under a general system, and are cut about once in eight, ten, or twelve years, according to the uses for which the wood is designed. The principal part of the county is enclosed; and as most of the enclosures are bounded by hedgerows, it has a very sylvan and woody appearance.

The principal rivers and streams of this county are the Wye, the Lugg, the Munnow, the Arrow, the Frome, the Team, and the Leddon.

The Wye has been often celebrated for the extremely picturesque and diversified scenery which adorns its meandering channel. Rising near the summit of the Plinlimmon Hills, in Montgomeryshire, it flows between the counties of Brecknock and Raduor, and afterwards enters Herefordshire near Clifford, the reputed birthplace of the ill-fated fair Rosamond. Winding to the east, above Clifford Castle, it glides beautifully between orchards, meadows, and cornfields, till it reaches the abrupt and commanding eminence of Mawbech Hill: thence, darting suddenly through the bold arches of Bredwardine bridge, it flows on to Hereford, through a more level but still extremely pleasant country. From Hereford to Ross, its features occasionally assume greater boldness; though more frequently their aspect is placid: but at the latter town, wholly emerging from its late state of apparent repose, it resumes the brightness and rapidity of its primitive character, as it forms the ad-raired curve which the church-yard of Ross commands. The celebrated spire of Ross church, peeping over a noble row of elms, here fronts the ruined Castle of Wilton, beneath the arches of whose bridge the Wye flows through a charming succession of meadows, encircling at last the lofty and well-wooded hill crowned with the majestic fragments of Goodrich Castle, and opposed by the waving eminences of the Forest of Dean. The mighty pile or peninsula of Symond's Rock succeeds, round which the river flows in a circuit of seven miles; though the opposite points of the isthmus are only one mile asunder. Shortly afterwards the Wye quits the county, and enters Monmouthshire at the New Wear.

This river is navigable to Hereford in barges of from eighteen to forty tons; but either a large or a small supply of water is equally fatal to the navigation. The latter is experienced during the greater part of every dry summer, when shoals barely covered with the stream occur very frequently : in winter, heavy rains, or snow dissolving on the river's banks, within the county, have the effect of gradually adding a few inches to the depth; but when these rush into its channel, from the mountains of Brecknock and Radnorshire, they occasion an almost instantaneous overflow, and give it a force which defies all the ordinary means of resistance and control. By this impetuosity considerable quantities of land are frequently removed from their situations on one side or the other, and new channels are thus formed in various places: to this impetuosity is also to be ascribed the want of a sufficient number of bridges to render the communication safe and easy between different parts of the county. In the whole extent of the Wye through Herefordshire there was only one bridge (at Hereford) till the year 1597. An act of parliament was then obtained for erecting a second at Wilton; and since that time two more have been added; the one at Bredwardine, by an act passed in the year 1762; and the other at Witney, by an act passed in 1780. That at Bredwardine, which is built of brick, after sustaining some damage by the great flood of 1795, has continued to resist the impetuosity of the river; but that of Witney has been already twice destroyed, and was again renewed on stone piers in the year 1802. The principal fish taken in the Wye is the salmon, which is found in it at all times, but only in perfection between the months of December and August. They were formerly more abundant than at present; so much so indeed, that, in the indentures of apprenticeship at Hereford, it was once a clause that the apprentice should not be compelled to live on them more frequently than two days in a week. Their passage up the river is now, however, so much obstructed by iron works, that unless the water is swelled far above its usual height, they cannot advance.

The river Lugg has its origin in Radnorshire, but enters Herefordshire on the north-west side, near Stapleton Castle : thence, flowing in a southeast direction, it receives the Pinsley near Leominster; and afterwards, inclining to the south, is increased by the waters of the Arrow and the Frome. Soon after its junction with the latter river it falls into the Wye, near the pleasant village of Mordisford. The district of country through which this river flows is fine and fertile, but far less abundant in beautiful scenery than the Wye; though Drayton has characterised the Lugg as 'more lovlie.' Like the Wye, however, it is subject to sudden overflows, and is frequently swelled by partial rains, which give it great rapidity and force to its junction with that river. These circumstances have operated to prevent its being rendered navigable, though two acts of parliament have been passed for that purpose. The Munnow rises on the Herefordshire side of the Hatterell mountains, and flowing south-eastward is joined near Longtown by the Escle and Olchron rivulets, which have their springs also near the sources of the Munnow: thence flowing southward, through a pleasant and sequestered vale, it is joined near Alterynnis by the Hothny; after which it turns to the north-east towards Pontrilas, and near that place is increased by the united streams of the Dove and the Werme, which also rise in this county; the former at Dorston (Dore's town), and the latter at Alansmoore. Again, turning to the south-east, it forms the boundary between Herefordshire and Monmouthshire, till it quits the county at Llanrothal, and flowing towards Monmouth is received by the river Wye immediately below that town. The Team or Teme enters this county from the confines of Radnorshire and Shropshire, a short distance north-west from Brampton Bryan, and flowing eastward runs into Shropshire, near Ludlow: thence bending to the south it again enters Herefordshire, but soon leaves it for Worcestershire; where, having made a considerable circuit, it once more flows on the borders of this county, of which it becomes the boundary for a mile or two above and below Whiteborn; after which it discharges itself into the Severn, between Malvern Chace and Woodbury Hill in Worcestershire. In the muscle-shells of this river pearls have occasionally been found. The Leedon, or Leddon, rises above Bosbury on the east side of the county, and running to the south gives name to the town of Ledbury; thence

flowing into Gloucestershire it unites with the Severn. The Arrow enters Herefordshire from Radnorshire, and flowing to the east falls into the Lugg below Leominster. The Frome rises near Wolfrelow above Bromyard, and taking a south course is joined by the Lowden near Stretton Grandison; when turning to the southwest it unites with the Lugg'above Mordisford. The inland navigation of Herefordshire is very imperfect; though scarcely any county possessing neither iron-works nor any principal manufacture can have greater occasion for its aids. Some medicinal springs have been noticed as rising on the side of the Malvern Hills, and known among the peasantry by the customary name of Holy-wells. Several petrifying springs are also met with in the neighbourhood of Moccas, Fownhope, Llanrothal, Wormesley, &c., and other hilly parts of the county where the soil is calcareous. Near Richard's Castle a small spring has obtained the name of Bonewell, from the circumstance of its frequently emitting, when disturbed, small bones resembling vertebræ and other bones of the frog.

Herefordshire returns eight members to parliament, viz. two for the county, two for the city of Hereford, two for Leominster, and two for Weobly.

Robert Devereux, the celebrated earl of Essex, was born at Netherwood in this county in 1567. -Ile was beheaded in 1601 .- Captain James Cornwall, an excellent naval commander, was born at Bredwardine Castle, and was killed off Toulon, a chain shot depriving him of both his legs, on February 27th, 1743.-He has a noble monument in Westminster Abbey, thirty-six feet high .- David Garriek, the British Roseius, was born at Hereford in 1716, and died in 1779.-Nor must we omit to notice, among the eminent persons of this county, the famous Eleanor Gwynn, the celebrated courtezan in the reign of Charles II .- She died in 1687 .- It has been also said that John Kyrle, Pope's Man of Ross, was born at Ross, and died in the year 1724, aged ninety. With an income of £500 per annum he was a blessing to the whole county .- Hereford is a bishop's see, and gives the title of viscour.t to the Devereux family .- Besides the making of cyder, which is very extensive, this county manufactures coarse woollen cloth, hats, and gloves.

HEREFORD, the capital of the above county, is situated on a gentle eminence from the river Wye, on the northern bank of which it stands near the centre of the county. This town was a strong station for the Saxon and English forces. By some it is supposed to have been built on the site of Ariconium, an ancient town mentioned by Antoninus, which was destroyed by an earthquake. A church was built here early in the ninth century by king Melfred, the Mercian, in memory of Ethelbert, king of the East Angles, murdered by king Offa's queen at Marden, in this neighbourhood. Soon after it became a cathedral and a bishop's see : the cathedral was rebuilt by bishop Athelstan between 1012 and 1056. At the Norman conquest it was in ruins; the Welsh having, in the reign of Edward the Confessor, destroyed the cathedral, sacked the city, and carried off the bishop. The presen cathedral was begun by the second Norman bishop, Robert de Losin, on the model of the church of Aix-la-Chapelle, and completed by his successor. In 1786 its large western tower fell down, but it has since been tastefully rebuilt. Here were formerly six other churches, but at present there are only four, two being destroyed in the civil wars, viz. All-Saints', St. Peter's, St. John the Baptist's, and St. Nicholas; and several meeting-houses for the dissenters. Formerly there was an hospital of the knights of St. John of Jerusalem at Hereford, together with three other hospitals, a college of gray-friars, and a house of black-friars : on the site of the latter a well-endowed hospital was founded in 1614, with a neat chapel. It has a remarkably ancient stone pulpit. Ilere is also a good free grammarschool, endowed with scholarships and exhibitions at each of the universities, the master and also the assistant of which are elected by the dean and chapter of the cathedral. The Wye is navigable for barges of considerable burden, which bring up coals and other articles, and carry back cider, timber, bark, and corn. A projected Gloucester and Hereford canal is expected to be speedily finished, by which the trade of the town will be greatly augmented. In general it is well built, and the streets are wide and clean. The manufactures are gloves, hats, and flannels, but only to a small extent. The county-gaol and shire-hall are respectable edifices; and the former is excellently regulated. The old town-hall is a curious wooden fabric. We may also notice here the guildhall, an infirmary, a lunatic asylum, a public library, and a savings' bank. In Broad Street stands a small, but neat theatre. Over the river Wye there is a stone bridge of six arches, built about the end of the fifteenth century. The city is governed by a mayor, escheator, called usually the late mayor, six aldermen, a common council, recorder, &c. It returns two members to parliament, elected by the freemen (in number about 1250), and the mayor is the returning officer. The ramparts and site of the castle, now called Castle-Green, form an agreeable promenade. A triennial music meeting is held here of the three choirs of Worcester, Hereford, and Gloucester, for the performance of oratorios, &c., for the benefit of the widows and orphans of the clergy. They are generally assisted by some of the principal performers from London, Bath, and Oxford. The chief beverage is cider. The city, standing on a gravelly soil, is accounted very healthy, and gives the title of viscount to the family of Devereux. Markets for the sale of poultry, butter, tish, &c., were erected in 1810. The marketdays are Wednesday and Saturday, for poultry, butter, &c.; Friday for live stock, and St. Andrew's-day for cattle and horses. Fairs, first Tuesday after February 2d, Wednesday in Easterweek, July 1st, and October 20th. It is thirteen miles south of Leominster, fourteen N. N. W. of Ross, and 135 W. N. W. of London.

HEREMITICAL, adj. HER'MIT, n.S. HER'MITAGE, n.S. HER'MITESS, n. s. HEBMITI'CAL, adj.

Fr. hermite, hermitage; Gr. ερημος. A solitary, or ancho-ret, who retires from the world for con-

templation and devotion; a beadsman, one bound to pray for another : hermitage, the residence of a hermit: hermitess, a female recluse : heremitical and hermitical, solitary; contemplative; suitable, or belonging to, a hermit.

Tyll at last word cam onto the Emperour

That Fawnus was without wyfe, and seld was jocounde,

But mournyng for Agea that he was to ybounde,

And lyved as an hermyte, soule and destitute

Wythout consolacioune, pensyff of and mute. Chaucer. The Merchantes Second Tale.

'Yea; than;' quod I, ' what done these processes here,

Nonnes, and hermites, freres, and all tho

That sit in white, in russet and in grene ?'

Chaucer. The Court of Love.

By what painful way they pass,

Forth to an hill, that was both steep and high ;

On top whercof a sacred chapel was,

And eke a little hermitage thereby.

Faerie Queene.

For those of old, And the late dignities heaped up to them,

We rest your hermit. Shakspeare. A withered hermit, fivescore winters woru,

Id. Might shake off fifty looking in her eye. Go with speed

To some forlorn and naked hermitage, Remote from all the pleasures of the world. Id.

You lay this command upon me, to give you my poor advice for your carriage in so eminent a place; I humbly return you mine opinion, such as an hermit rather than a courtier can render. Bacon.

And may at last my weary age Find out the peaceful hermitage, The hairy gown and mossy cell, Where I may sit and rightly spell Of every star that heaven doth shew, And every herb that sips the dew.

About two leagues from Fribourg we went to see a hermitage ; it lies in the prettiest solitude imaginable, among woods and rocks. Addison on Italy.

He had been duke of Savoy, and, after a very glorious reign, took on him the habit of a hermit, and retired into this solitary spot. Id.

You describe so well your heremitical state of life, that none of the ancient anchorites could go beyond Pope. you for a cave in a rock.

HER'ESY, n.s. HERE'SIARCH, n. s. HER'ETIC, n.s.

Fr. heresie, Lat. haresis; Gr. aipeous, aipeous, and apxog: from aipew, Choice; HERET'ICALLY, adv. for choose. Choice; HERET'ICALLY, adv. party chosen, or ad-

Milton.

hered to; sect: hence, party or opinion adhered to unreasonably or obstinately; faction; terms generally applied by the Romish church to all who differ from her doctrines. Heresiarch is the principal leader or propagator of heresy: heretical is generally used in a bad sense; and sometimes by way of contempt, or in jest. See Dr. Campbell's Preliminary Dissertations to his Four Gospels, Diss. ix. for an able account of the meaning of augeous in the Greek New Testament.

How exclude they us from being any part of the church of Christ under the colour of heresy, when they cannot but grant it possible even for him to be, as touching his own personal persuasion, heretical, who, in their opinion, not only is of the church, but holdeth the chiefest place of authority over the same ? Houker.

I rather will suspect the sun with cold

Than thee with wantonness; thy honour stands, In him that was of late an *horetick*,

As firm as faith. Shakspeare. These things would be prevented, if no known heretick or schismatick be suffered to go into those coun-

tries. Bacon. As for speculative heresies, they work mightily upon men's wits; yet do not produce great alterations in states. Id.

No hereticks desire to spread

Their wild opinions like these Epicures. Davies.

Let the truth of that religion I profess be represented to her judgment, not in the odious disguises of levity, schism, *heresy*, novelty, cruelty, and disloyalty.

King Charles.

The pope declared him not only an heretick, but an heresiarch. Stillingfleet.

Bellarmin owns, that he has quoted a heretick instead of a father. Baker on Learning.

When a Papist uses the word *hereticks*, he generally means Protestants; when a Protestant uses the word, he means any persons wilfully and contentiously obstinate in fundamental errours. *Watts*.

Constantinople was in an uproar, upon an ignorant jealousy that those words had some *heretical* meaning. Decay of Piety.

HERESY, in law, consists in a denial of some of the essential doctrines of Christianity, publicly and obstinately avowed; being defined, 'sententia rerum divinarum humano sensu excogitata, palam docta et pertinaciter defensa.' And here it must be acknowledged, that particular modes of belief or unbelief, not tending to overturn Christianity, or to sap the foundations of morality, are by no means the object of coercion by the civil magistrate. What doctrines shall therefore be adjudged heresy was left by our old constitution to the determination of the ecclesiastical judge; who had herein a most arbitrary latitude allowed him. For the general definition of a heretic given by Lyndewode extends to the smallest deviations from the doctrines of the holy church: 'hæreticus est qui dubitat de fide catholica, et qui negligit servare ea, quæ Romana ecclesia statuit, seu servare decreverat.' Or, as the statute 2 Hen. IV. c. 15 expresses it in English, 'teachers of erroneous opinions, contrary to the faith and blessed determinations of the holy church.' Very contrary this to the usage of the first general councils, which defined all heretical doctrines with the utmost precision and exactness. And what ought to have alleviated the punishment, the uncertainty of the crime, seems to have enhanced it in those days of blind zeal and pious cruelty. The sanctimonious hypocrisy of the canonists, indeed, went at first no farther than enjoining penance, excommunication, and ecclesiastical deprivation, for heresy: but afterwards they proceeded boldly to imprisonment by the ordinary, and confiscation of goods in pios usus. But in the mean time they had prevailed upon the weakness of bigoted princes to make the civil power subservient to their purposes, by making heresy not only a temporal, but even a capital offence : the Romish ecclesiastics determining, without appeal, whatever they pleased to be heresy, and shifting off to the secular arm the odium and drudgery of executions: with which they pretended to be too tender and delicate to intermeddle. Nay, they

heretic, ut citra mortis periculum sententiæ circa eum moderetur; well knowing that at the same time they were delivering the unhappy victim to certain death. See Act of FAITH. Hence the capital punishments inflicted on the ancient Donatists and Manichæans by the emperors Theodosius and Justinian; hence also the constitution of the emperor Frederic, mentioned by Lyndewode, adjudging all persons without distinction to be burnt with fire, who were convicted of heresy by the ecclesiastical judge. The same emperor, in another constitution, ordained, that if any temporal lord, when admonished by the church, should neglect to clear his territories of heretics within a year, it should be lawful for good catholics to seize and occupy the lands, and utterly to exterminate the heretical possessors. And upon this foundation was built that arbitrary power so long claimed, and so fatally exerted by the pope, of disposing even of the kingdoms of refractory princes to more dutiful sons of the church. The immediate event of this constitution serves to illustrate at once the gratitude of the holy see, and the just punishment of the royal bigot; for, upon the authority of this very constitution, the pope afterwards expelled this very emperor Frederic from his kingdom of Sicily, and gave it to Charles of Anjou. Christianity being thus deformed by the dæmon of persecution upon the continent, our own island could not escape its scourge. Accordingly we find a writ de hæretico comburendo, i.e. of burning the heretic. But the king might pardon the convict by issuing no process against him; the writ de hæretico comburendo being not a writ of course, but issuing only by the special direction of the king in council. In the reign of Henry IV., when the eyes of the Christian world began to open, and the seeds of the Protestant religion (under the opprobrious name of Lollardy) took root in this kingdom; the clergy, taking advantage from the king's dubious title to demand an increase of their own power, obtained an act of parliament, which sharpened the edge of persecution to its utmost keenness. By stat. 2 Hen. V., c. 7., Lollardy was also made a temporal offence, and indictable in the king's courts, which did not thereby gain an exclusive, but only a concurrent, jurisdiction with the bishop's consistory. Afterwards, when the reformation began to advance, the power of the ecclesiastics was somewhat moderated; for, though what heresy is was not then precisely defined, yet we are told in some points what it is not; the statute 25 Henry VIII., c. 14, declaring that offences against the see of Rome are not heresy; and the ordinary being thereby restrained from proceeding in any case upon mere suspicion; i.e. unless the party be accused by two credible witnesses, or an indictment of heresy be first previously found in the king's courts of common law. And yet the spirit of persecution was not abated, but only diverted into a lay channe'. For in six years afterwards, by stat. 31 Hen VIII. c. 14, the bloody law of the six articles was made; which were 'determined and resolved by the most godly study, pain, and travail of his majesty; for which his

affected to intercede, on behalf of the convicted

most humble and obedient subjects, the lords spiritual and temporal, and the commons, in parliament assembled, did render and give unto his highness their most high and hearty thanks ! The same statute established a mixed jurisdiction of elergy and laity for the trial and conviction of heretics; Henry being equally intent on destroying the supremacy of the bishops of Rome, and establishing all their other corruptions of the Christian religion. Without recapitulating the various repeals and revivals of these sanguinary laws, in the two succeeding reigns, we proceed to the reign of queen Elizabeth; when the refor-mation was finally established. By stat. 2 Eliz. c. 1, all former statutes relating to heresy are repealed, which leaves the jurisdiction of heresy as it stood at common law; viz. as to the infliction of common censures, in the ecclesiastical courts; and in case of burning the heretic, in the provincial synod only. Sir Matthew Hale is indeed of a different opinion, and holds that such power resided in the diocesan also; though he agrees, that in either case the writ de hæretico comburendo was not demandable of common right, but grantable, or otherwise, merely at the king's discretion. But the principal point now gained was, that by this statute a boundary is for the first time set to what shall be accounted heresy; nothing for the future being to be so determined, but only such tenets as have been heretofore so declared, 1. By the words of the canonical scriptures; 2. By the first four general councils, or such others as have only used the words of the holy scriptures; or 3. Which shall hereafter be so declared by the parliament, with the assent of the clergy in convocation. Thus was heresy reduced to a greater certainty than before ; though it might not have been the worse to have defined it in terms still more precise and particular : as a man continued still hable to be burnt for what perhaps he did not understand to be heresy, till the ecclesiastical judge so interpreted the words of the canonical scriptures. For the writ de hæretico comburendo remained still in force, till it was totally abolished, and heresy again subjected only to ecclesiastical correction, pro salute animæ, by stat. 29 Car. II. e. 9: when, in one and the same reign, our lands were delivered from the slavery of military tenures; our bodies from arbitrary imprisonment by the habeas corpus act; and our minds from the tyranny of superstitious bigotry, by demolishing this last badge of persecution in the English law.

HERETOCH, among the Anglo-Saxons, signified the same with dux or duke, denoting the commander of an army. It appears, from Edward the Confessor's laws, that the military force of this kingdom was in the hands of the heretochs, who were constituted through every province and county in the kingdom, being selected out of the principal nobility, and such as were most remarkable as sapientes, fideles, et animosi. Their duty was to lead and regulate the English armies, with a very unlimited power; on which account they were elected by the people in their folk-mote or full assembly, in the same manner as sheriffs. HERFORD, or HERVORDEN, an old fortified town of Prussian Westphalia, in the county of Ravensberg, at the confluence of the Werra and the Aa. It is divided into the Old and New Town, and a suburb called Radewig; and contains a considerable manufactory of cotton thread, and of linen. Here were formerly an abbey and a convent, secularised in 1804; also a commandery of the order of St. John. Inhabitants 6000. Eleven miles E, N. E. of Ravensberg. ILERGEST'S ISLANDS, a group of islands in

HERGEST'S ISLANDS, a group of islands in the South Pacific, discovered by lientenant Hergest in the Dædalus, in the year 1792. They consist of Riou's, Trevenen's, Sir Henry Martin's, and Robert's Isles, and extend from lat. 7° 53' to 9° 14' S., and from long. 219° 47' to 220° 21' E.

Ilergest's Rocks, two rocky islets in the Pacific Ocean, also discovered by lieutenant Hergest in the year 1792. Long. 219° 42' E., lat. 7° 38' S.

HERJEDALEN, a district in the north of Sweden, included in Gefleborgstæn, and bounded on the north by Jemptland, and on the west by Norway. It forms a large wooded valley extending between 62° and 63° of N. lat., watered by the Ljunga and Ljusna, and flanked by lofty mountains. There is but little corn land, though it seems capable of a more extended cultivation. On the other hand, it abounds in cattle, game, and fish ; and the inhabitants carry on a good trade in cheese. Territorial extent 3200 square miles Population about 4000.

HE'RIOT, n. s. Sax. benezilo. A fine paid to the lord at the death of a land-holder, commonly the best thing in the landholder's possession.

Though thou consume but to renew,

Yet love, as lord, doth claim a heriot due.

Cleaveland. This he detains from the ivy, for he should be the true possessory lord thereof; but the olive dispenseth with his conscience to pass it over with a compliment and a heriot every year. Howel.

I took him up, as your *heriot*, with intention to have made the best of him, and then have brought the whole produce of him in a purse to you. Dryden.

HERIOT, in law, is a customary tribute of goods and chattels, payable to the lord of the see on the decease of the owner of the land. See TE-NURE. It is of two sorts, viz. Heriot custom, where heriots have been paid time out of mind by custom, after the death of a tenant for life. In some places there is a customary composition in money, as ten or twenty shillings in lieu of a heriot, by which the lord and tenant are both bound, if it be an indisputably ancient custom : but a new composition of this sort will not bind the representatives of either party. Heriot service, when a tenant holds by such service to pay heriot at the time of his death; which service is expressed in the deed of feoffment. For this latter the lord shall distrain; and for the other he shall seize and not distrain. If the lord purchase part of the tenantry, neriot service is extinguished; but it is not so of heriot custom.

HERIOT (George), jeweller to king James VI. and Charles J., the founder of the elegant hospital

HER

at Edinburgh which bears his name, was born in the parish of Gladsmuir, in East Lothian. His ancestors were proprietors of the small village of Trabrowne, and their names appear on the roll of the Scotch parliament. Mr. Creech says, he furnished jewels to prince Charles, afterwards king Charles I., when he went to the court of Spain in 1623. 'These jewels were never paid for by James; but, when Charles I. came to the throne, the debt to Heriot was allowed to his trustees, in part of their purchase of the barony of Broughton, then crown lands in the neighbourhood of Edinburgh. These lands are now a part of the foundation of the hospital. Mr. Heriot died in 1627. Tradition reports, that he acquired his fortune by purchasing for a trifle a large quantity of yellow sand, with which a shipmaster, who traded to Africa, had loaded his vessel by way of ballast, from the coast of Guinea, without knowing its value; but in which Heriot soon discerned a considerable proportion of gold dust, which he afterwards extracted.

HERIOT'S HOSPITAL. See EDINBURGH.

HERISA, or HERISHAW, an ancient town of Switzerland, in the canton of Appenzel, on the Bulbach. It was the first town of the canton that embraced Christianity. The manufactures of linen, cotton, and muslin, chiefly employ 6000 inhabitants. It is twenty-seven miles south-west of St. Gall, and ten north-west of Appenzel.

IIERISSON, in fortification, a beam armed with a great number of iron spikes with their points outwards, and supported by a pivot, on which it turns. These serve as a barrier to block up any passage, and are frequently placed before the gates, and more especially the wicket doors of a town or fortress, to secure those passages which must be often opened and shut.

HERITIER (Nicholas I'), a French poet of the seventeenth century, who was historiographer of France, and treasurer to the guards. He wrote two tragedies, entitled Hercule Furieux, and Clovis. Ile died in 1680.

HERITIER (Mary Jane l' de Villandon), a French poetess, daugher of the above, was born in 1664. She was a member of the academies of the Jeux Floraux, and the Ricovrati at Padua. She wrote, 1. Translation of Ovid's Epistles; 2. La Tour Tenebreuse, an English Tale; 3. Les Caprices du Destin, a novel; and 4, L'Avare puni, a tale in poetry.

HERITIER (Charles Louis 1' de Brutelle), an eminent French botanist, one of the most distinguished students and promoters of the Linnwan principles and accuracy in his own country, was born of an opulent mercantile family, at Paris in 1746. In 1772 he was appointed superintendaut of the waters and forests of the Generalité of Paris; and, his active mind being turned to fulfil the duties of his office, he began to apply to botany, with a particular view to the knowledge of forest trees. He soon extended his enquiries; studied the works of Linnwas; and became one of the most zealous disciples of the illustrious Swede. He died in 1800 at Paris.

HERITIERA, in botany, so named in honor of the able French botanist, Charles Louis l'Heritier de Brutello. Essential character; MALE CAL. five toothed; cor. none; filament columnar; anthers, from five to ten, below the top; FEMALE CAL. five toothed; cor. none; germens five, sessile, with five pairs of barren anthers between them; drupas five, dry, of one cell; SEEDS solitary. Species one only; a native of Ceylon, and cultivated in Kew gardens under the name of the looking-glass plant.

HERKIMER, a county of New York, United States, erected from Montgomery county in 1791, but, by successive subdivisions, now restricted to a smaller area. Its present form is an irregular oblong, embracing the Mohawk River, which crosses the southern part. Its geographical centre lies about eighty-five miles on a right line north-west from Albany. It is bounded north by St. Lawrence county, east by Montgomery county and a small augle of Otsego county, south by Otsego county, and west by Oneida and Lewis counties; its greatest length north and south is eighty-five miles ; its greatest width sixteen miles. The area is 1106 square miles, or 717,840 acres. Situated between 42° 49' and 44° 7' N. lat., and 0° 44' and 1° 15' W. long. from New York. This county has a large proportion of hilly land, and as great a diversity of soil as any in the state. The southern part furnishes some of the small sources of the Susquehanna.

HERKLA, a town on the east coast of Tunis, Africa, the Adrumetum of earlier times, the Justiniana of the middle ages, and the Heraclea of the Lower empire. It was built on a promontory, and appears to have been about a mile in circuit; but the ruins did not appear to Dr. Shaw so extensive as he expected.

HERMÆA, in antiquity, ancient Greek festivals in honor of Mercury. One of these was celebrated by the Pheneatæ in Arcadia; a second by the Cyllenians in Elis; and a third by the Tanagreans, where Mercury was represented with a ram upon his shoulder, because he was said to have walked through the city in that posture in time of a plague, and to have cured the sick; in memory of which it was customary, at this festival, for one of the most beautiful youths in the city to walk round the walls with a ram upon his shoulder. A fourth festival was observed in Crete, when it was usual for the servants to sit down at the table while their masters waited; a custom which was also observed at the Roman Saturnalia.

HERMAN (Paul), a famous botanist in the seventeenth century, born at Hall, in Saxony. Ile practised physic in the isle of Ceylon, and was afterwards professor of botany at Leyden, where he died in 1695. He wrote 1. A Catalogue of the Plants in the Public Garden at Leyden; 2. Cynosura Materix Medicx; 3. Floræ Lugduno-Batavæ flores: 4. Paradisus Batavus; and, 5, Musæum Zeylanicum.

HERMANN (James), a learned mathematician of the academy at Berlin, and a member of the academy of sciences at Paris, was born at Basil in 1678. He was a great traveller, and for six years was professor of mathematics at Padua. He afterwards went to Russia, being invited thither by Peter the Great, in 1724. On his return to Basil he was made professor of morality and 204

natural law; and died there in 1733. He wrote several mathematical works.

IIERMANNIA, in botany, a genus of the pentandria order and monadelphia class of plants; natural order thirty-seventh, columniferæ; cAPS. quinquelocular; the petals at the base are semitubulated and oblique. There are twenty-two species.

1. It. almifolia, has a shrubby stalk and branches growing irregularly four or five feet high, with pale yellow flowers in short spikes from the sides and ends of the branches, appearing in April or May.

2. II. althaifolia, has a shrubby stalk, and soft woolly branches, growing two feet high, with numerous yellow flowers in short spikes growing at the end of the branches, and making their appearance in July.

3. 11. grossularifolia has a shrubby stalk and spreading branches, growing three or four feet high, with bright yellow flowers coming out in great numbers at the ends of all the shoots and branches in April or May.

4. H. hyssopifolia has a shrubby upright stalk, branching out laterally six or seven feet high, with pale yellow flowers in clusters from the sides of the branches, appearing in May and June.

5. II. lavendulifolia has a shrubby stalk and slender branches, very bushy, about a foot and a half high, small spear-shaped, obtuse and hairy leaves, with clusters of small yellow flowers along the sides of the branches continuing from June to Autumn. All these plants are natives of Africa, and therefore must be kept in a greenhouse during the winter in this country. They are propagated by cuttings of their young shoots, which may be planted in pots of rich earth from April to July.

HERMANNSTADT, or Szeben, the ancient Cibinium, or Hermanopolis, is a large fortified town of Transylvania, of which it was formerly the capital, and stands on the river Szeben, in a beautiful plain. It is not considered healthy: and its streets and general accommodations are inferior to most towns of Europe of the same size. As the chief town of the Saxon settlers in Transylvania, it is the place of their archives, and the seat of a Protestant university. It has also a convent and three monasteries, one of which belongs to the Greek monks of St. Basil. The principal square contains a fine statue and fountain. The orphan hospital, the barracks outside of the town, the theatre, and the residence of baron Bruckenthal, are also worth notice. The last contains a good library, and a valuable collection of pictures, antiquities, and natural history. Its chief manufacture is soap and candles. Thirty miles south-east of Weissenburg, and 392 south-east of Vienna.

HERMANT (Godfrey), a learned doctor of the Sorbonne, born at Beauvais in 1617. He wrote many works; the principal of which are, 1. The Lives of St. Athanasius, St. Basil, St. Gregory Nazianzen, St. Chrysostom, and St. Ambrose. 2. Four pieces in defence of the rights of the university of Paris against the Jesuits. 3. A French Translation of St. Chrysostom's Treatise of Providence, and Basil's Ascetics. 4. Extracts from the Councils; published after his death, under the title of Clavis disciplinæ Ecclesiasticæ. Ife died suddenly at Paris, in 1690.

HERMAPH'RODITE, n. s.) Fr. herma-HERMAPHRODIT'ICAL, adj. Sphrodite, from έφμῆς and αφφοδίτη. An animal uniting two sexes.

Man and wife make but one right

Canonical hermaphrodite. Cleaveland. There may be equivocal seeds and hermaphroditical principles, that contain the radicality of different forms. Browne.

The chosen knight And free companion of the gallant Bourbon, Late Constable of France; and now to be Lord of the city which hath been Earth's lord Under its emperors, and changing sex, Not sceptre, an *hermaphrodite* of empire— Lady of the Old World.

Byron. Deformed Transformed.

A HERMAPHRODITE is generally understood to signify a human creature possessed of both sexes, or who has the parts of generation both of male and female. The term, however, is applied also to other animals, and even to plants. The word is a compound of $E\rho\mu\eta\varsigma$, Mercury, and $A\phi\rho\sigma\delta\iota\tau\eta$, Venus; q. d. a mixture of Mercury and Venus, i. e. of male and female. By Mr. Hunter, hermaphrodites are divided into natural and unnatural, or monstrous. The first belongs to the more simple orders of animals, of which there is a much greater number than of the more perfect. The unnatural takes place in every tribe of animals having distinct sexes, but is more common in some than in others. The human species, he imagines, has the fewest, never having seen them in that species, nor in dogs; but in the horse, sheep, and black cattle, they are very frequent. From Mr. Hunter's account, however, it does not appear that such a creature as a perfect hermaphrodite has ever existed. All the hermaphrodites which he had the opportunity of seeing had the appearance of females, and were generally thought such. In the horse they are very frequent. In most species of animals, the production of hermaphrodites appears to be the effect of chance; but in the black cattle it seems to be an established principle of their propaga-tion. It is a well-known fact, and, as far as has yet been discovered, appears to be universal, that when a cow brings forth two calves, one of them a bull, and the other a cow to appearance, the cow is unfit for propagation, but the bull-calf becomes a very proper bull. The cows are known' not to breed; they do not even show the least inclination for the bull, nor does the bull ever take the least notice of them. Among the country-people in England, this kind of calf is called a free-martin; and this singularity is just as well known among the farmers as either cow or bull. When they are preserved, it is for the purposes of an ox or spayed heifer, viz. to yoke with the oxen, or fatten for the table. They are much larger than either the bull or the cow, and the horns grow longer and bigger, being very similar to those of an ox. The bellow of a free-martin is similar to that of an ox, and the meat is similar to that of the ox or spayed heifer, viz much finer in the fibre than either the bull or cow;

HER

and they are more susceptible of growing fat with good food. By some they are supposed to exceed the ox and heifer in delicacy of taste, and bear a higher price at market. The Romans, who called bull taurus, spoke also of tauræ, in the feminine gender, different from vacca or cows. Stephens observes, that it was thought they meant by this word barren cows, which obtained this name because they did not conceive any more than bulls. He quotes a passage from Columella : 'And, like the tauræ, which occupy the place of fertile cows, should be rejected or sent away.' He likewise quotes Varro, De re Rustica: 'The cow which is barren is called taura.' Among the reptile tribe, such as worms, snails, leeches, &c., hermaphrodites are very frequent. In the Memoirs of the French Academy, we have an account of this very extraordinary kind of hermaphrodites, which not only have both sexes, but do the office of both at the same time. Such are earth-worms, round-tailed worms found in the intestines of men and horses, land snails, and those of fresh waters, and all the sorts of leeches. And, as all these are reptiles, and without bones, M. Poupart concludes it probable, that all other insects which have these two characters are also hermaphrodites. The method of coupling practised in this class of hermaphrodites, may be illustrated in the instance of earthworms. These creep, two by two, out of holes proper to receive them, where they dispose their bodies in such a manner as that the head of the one is turned to the tail of the other. Being thus stretched lengthwise, a little conical button or papilla is thrust forth by each, and received into an aperture of the other. Among the insects of the soft or boneless kind, there are great numbers which are so far from being hermaphro-dites, that they are of no sex at all. Of this kind are all the caterpillars, maggots, and worms, pro-duced of the eggs of flies of all kinds: but the reason of this is plain; these are not animals in a perfect state, but disguises under which animals lurk. In the collection of insects belonging to professor Germar are the following hermaphrodite butterflies: 1. Papilio atalanta. The left side male, the right side female; the left pair of wings is smaller, and more deeply notched than the right: the left antenna shorter than the right. 2. Papilio antiopa; the right side male, and left side female. The right antenna much shorter than the left. 3. Papilio phæbe; left side male: left antenna shorter than the right; and the left pair of wings smaller, but the color and margin same as the right pair : hinder part of the body same as in male. 4. Sphinx euphorhiæ; left side male, and smaller than the right or female side : the distribution of the color is remarbable; the whole under side of the body is divided by a line, in the direction of its length; the male side is covered with a green powder, while the female side has a white antenna, rosered breast, and the abdomen marked with white denticulations. 5. Sphinx galli; left side male; the right antenna and the right pair of wings longer than those of the male side; but there is no difference of color in the delineation of the two parts.

HERMAPHRODITE FLOWERS, in botany, are

so called by the sexualists on account of their containing both the anthera and stigma, the organs of generation, within the same calyx and petals. Of this kind are the flowers of atl the classes in Linnæus's sexual method, except the classes monœcia and diœcia; in the former of which, male and female flowers are produced on the same root; in the latter, on distinct plants from the same seed. In the class polygamia, there are always hermaphrodite flowers mixed with male or female, or both, either on the same or distinct roots. In the plantain tree the flowers are all hermaphrodite; in some, however, the anthera, or male organ, in others the stigma or female organ, proves abortive. The flowers in the former class are styled female hermaphrodites; in the latter, male hermaphrodites. Hermaphrodites are thus as frequent in the vegetable kingdom as they are rare in the animal one. See BOTANY.

HERMAPHRODITUS, in the pagan mythology, the son of Hermes, or Mercury, and Aphrodite, or Venus. Being educated on Mount Ida by the Naiades, Salmacis, one of these nymphs, fell desperately in love with him; but he refusing to gratify her passion, she watched him one day, while he was bathing in a fountain in Caria, and leaping into it, seized him, entwined herself about him, and by her prayers, obtained of the gods to have his body and hers united into one. Whereupon Hermaphroditus, finding himself thus metamorphosed, prayed his celestial parents, that in future every man who should bathe in that fountain should possess both scxes, which, according to Ovid, was also granted. Some explain the fable, that Hermaphroditus was represented as the son of Mercury and Venus, to exhibit the union between eloquence or commerce, whereof Mercury was god, with pleasure, whereof Venus was the deity.

HERMAS, an ecclesiastical author of the first century; and, according to Origen, Eusebius, and Jerome, the same whom St. Paul salutes in the end of his first epistle to the Romans. He wrote a book in Greek some time before Domitian's persecution, A. D. 95, entitled The Pastor, from his representing an angel speaking to him in it under the form of a shepherd. The Greek text is lost, but a very ancient Latin version of it is extant. Some of the fathers have considered this book as canonical. The best edition of it is that of 1698, where it is to be found among the other apostolical fathers, illustrated with the notes and corrections of Cotelerius and Le Clerc. With these it was translated into English by archbishop Wake, the best edition of which is that of 1710.

HERMAS, in botany, a genus of the monœcia order, belonging to the polygamia class of plants. The umbel in the hermaphrodite is terminal; there is a universal involucrum and partial ones. The rays of the small umbels are lobed; the central one flower-bearing; there are five petals, and five barren stamina; the seeds are two-fold and suborbicular. In the male the lateral umbels have universal and partial involuera; the small unbels are many-flowered; there are five petals, and five fertile stamina.

HERMELIN (Samuel Gustavus, baron), a

scientific Swedish nobleman, was a native of Stockholm, in which metropolis he was born in 1744. Having travelled over a great part of the European continent, he was entrusted with the conduct of a mission to the United States of America. On his return in 1784 he visited England; after which more than fifteen years of his life were devoted to his Swedish atlas. Through his exertions also, and principally at his own expense, great improvements were introduced among the mining establishments of Bothnia. After fifty-four years spent in important active services, he retired from public life in 1815, retaining his salary, with an additional pension of 1000 rix dollars. Besides a variety of tracts printed among the transactions of the Academy of Stockholm, the following treatises were published by him separately :- A Mineralogical Description of Lapland and Westro-Bothnia, with tables of the population and industry of the latter province; Mineralogical Charts of the Southern Provinces of Sweden; On the Melting and Casting of Copper Minerals; On the use of Stones found in the Swedish Quarries; and an Essay on the Resources of the Swedish Provinces. M. Hermelin closed his long and useful life on the 4th of May, 1820.

HERMES, Gr. EPMH Σ , from E $\rho\mu\eta\nu\epsilon\nu\sigma$, an interpreter. The Greek name of the god Mercury. See MERCURY.

HERMES, surnamed Trismegistus, i. e. thrice greatest, an Egyptian or Phænician priest and philosopher, and according to some a king; which triple office, they say, was the reason of this surname; though Suidas alleges, it was given him because he taught the doctrine of the Trinity. It is more probable, however, that he was so named on account of his great learning; for he is said to have written thirty-six books on divinity- and philosophy, and six on physic. Clemens Alexandrinus has given a catalogue of his works; but none of them are extant, except a piece entitled Poemander, which is reckoned spurious. He taught the Egyptians chemistry, the art of land-measuring, the cultivation of the olive, the division of time into hours, and the use of hieroglyphics. He is supposed to have flourished under Ninus or Osiris, about A. M. 2076.

HERMES, or HERMA, among antiquaries, a sort of Square or cubical figure of the god Mercury, usually made of marble, though sometimes of brass or other materials, without arms or legs, and planted by the Greeks and Romans in their cross-ways. Servius gives us the origin thereof, in his comment on the eighth book of the Æneid. 'Some shepherds,' says he, 'having one day caught Mercury asleep on a mountain, cut off his hands; from which he, as well as the mountain where the action was done, became denominated Cyllenius, from *kvllog*, maimed; and thence certain statues without arms are denominated Hermeses or Hermæ.' But this etymology of the epithet of Cyllenius contradicts most of the other ancient authors; who derive it from Mercury's hirth-place, Cyllene, a city of Elis, or the mountain Cyllene, which had been so named before him. Suidas gives a moral explication of this custom of making statues of Mercury without arms. ' The Hermeses,' says he,

' were statues of stone placed at the vestibules or porches of the doors and temples at Athens; for this reason, that, as Mercury was held the god of speech and of truth, square and cubical statues were peculiarly proper; having this, in common with truth, that on what side soever they are viewed, they always appear the same. Athens abounded more than any other place in Hermeses: there were abundance of very signal ones in various parts of the city, and they were indeed among the principal ornaments of the place. They were also placed in the high roads and cross-ways, because Mercury, who was the courier of the gods, presided over the highways; whence he had his surnames of Trivius and Viacus.

HERMET'ICAL, adj. HERMET'IC, adj. HERMET'ICALLY, adv. Trom Hermes, or Merlinventor of chemistry. Chemical.

The tube was closed at one end with diachylon, instead of an hermetical seal. Boyle.

An hermetical seal, or to seal any thing hermetically, is to heat the neck of a glass 'till it is just ready to melt, and then with a pair of hot pincers to twist it close together. Quincy,

He suffered those things to putrefy in hermetically scaled glasses, and vessels close covered with paper, and not only so, but in vessels covered with fine lawn, so as to admit the air, and keep out the insects: no living thing was ever produced there. Bentley.

HERMETICAL ART, a name given to chemistry, on a supposition that Hermes Trismegistus was the inventor of the art, or that he excelled therein. See HERMES.

HERMETICAL SEAL, a manner of closing glass vessels, for chemical operations, so very accurately, that nothing can exhale, not even the most subtile spirits. It is performed by heating the neck of the vessel in the flame of a lamp till it be ready to melt, and then with a pair of pincers twisting it close together. This chemists call putting on Hermes's seal.

HERMHIARPOCRATES, or HERMARPO-CRATES, in antiquity, a deity, or figure of a deity, composed of Mercury and Harpocrates, the god of silence. M. Spon gives a hermharpocrates in his Rech. Cur. de l'Antiquité, having wings on his feet like Mercury, and laying his finger on his mouth like Harpocrates. It has been suggested that this combination was intended to show that silence is sometimes eloquent.

HERMIANI, or HERMIATITE, a sect of heretics in the second century, thus called from their leader Hermias, and also denominated Seleuciani. One of their distinguishing tenets was, that God is corporeal; another, that Jesus Christ did not ascend into heaven with his body, but left it in the sun.

HERMIAS, a heretic of the second century, the founder of the above sect, born in Galatia. He maintained that the deity is material, the world eternal, and that the human soul is composed of fire and spirit.

[^] HERMILLY (Vaquette d'), a French historian, born at Amiens in 1707. He wrote the history of Majorca and Minorca, and translated Feijoo's Critical Theatre, and Ferara's History of Spain. HERMIONE, in fabulous history, the daughter of Menelaus and Helen, who was betrothed to her cousin Orestes, but afterwards married to Pyrrhus, whom Orestes therefore killed in the temple of Apollo, and recovered Hermione.

HERMIONE, in ancient geography, a considerable city of Argolis. It was in ruins, except a few temples, in the time of Pausanias; who says, that the new city was at the distance of four stadia from the promontory on which the temple of Neptune stood.

HERMIT is derived from the Greek $\epsilon_{0}\eta\mu_{0}c_{0}$, a desert, and therefore should rather be written eremite, Paul, surnamed the Hermit, is usually reckoned the first hermit; though St. Jerome, at the beginning of the Life of that saint, says it is not known who was the first. Some think John the Baptist, others Elias; others make St. Anthony the founder of the eremetical life; but others say, that he only rekindled and heightened the fervor thereof, and that his disciples owned St. Paul of Thebes for the first that practised it. The persecutions of Decius and Valerian are supposed to have been the occasion. Several of the ancient hermits, though they lived in deserts, had numbers of religious accompanying them. There are also various orders and congregations of religious distinguished by the title of hermits; as, hermits of St. Augustine, of St. John Baptist, of St. Jerome, of St. Paul, &c.

HERMITAGE is also applied to any religious cell, built and endowed in a recluse place, and annexed to some large abbey, of which the superior was called a hermit.

HERMITAGE, in geography, a hill of France on the side of the Rhone, opposite Tournon, famous for its vineyards, and the production of the red and white hermitage wine : on the top is the ancient chapel which gave name to the hill.

ΗΕ'RMODACTYL, n. s. Gr. έρμης and δάκτυλος.

Hermodactyl is a root of a determinate and regular figure, and represents the common figure of a heart cut in two, from half an inch to an inch in length. This drug was first brought into medicinal use by the Arabians, and comes from Egypt and Syria, where the people use them, while fresh, as a vomit or purge; and have a way of roasting them for food, which they eat in order to make themselves fat. The dried roots are a gentle purge, now little used. *Hill.*

HERMODACTYLS are brought from Turkey, and are of a white color, compact, yet easily cut or powdered, of a viscous whitish taste, with a light degree of acrimony. They were of great repute among the ancients as a cathartic; but those now sold in the shops have very little purgative virtue. Neumann declares he never found them to have any effect. The hermodactyl is the root of the colchicum variegatum, according to some; others suppose it to be that of the iris tuberosa.

HERMODORUS, a philosopher of Ephesus, who, coming to Rome, advised the making of the laws called the Twelve Tables; on which account a statue was erected to his memory.

HERMOGENES, the first and most celebrated architect of antiquity, was, according to Vitruvius, born at Alanbada, a city in Caria. He built a temple of Diana at Magnesia; another of Bacchus at Tros. He wrote a book on architecture, which is lost.

HERMOGENES, of Tarsus, an ancient orator, who was in every respect a prodigy. At seventeen years of age he published his System of Rhetoric, and at twenty his Philosophic Ideas; but at twenty-five totally lost his memory. His body being opened after his death, his heart was found of an extraordinary size, and hairy all over. He died about A. A. C. 168. His works were published by Aldus in 1509.

HERMOGENES, a heretic of the second century, born in Africa. He held matter to be the first principle; and, regarding it as the fountain of all evil, he maintained that the world, and every thing contained in it, as well as the souls of men and other spirits, were formed by the Deity from an uncreated and eternal mass of corrupt matter.

HERMOGENIANS, a sect of ancient heretics, so denominated from their leader Hermogenes. Their opinions were warmly opposed by Tertullian. They were divided into several branches under their respective chieftains, viz. Hermians, Seleucians, Materiari, &c.

HERMON, or AERMON, in ancient geography, a mountain of the Amorites, called Sanior by the Phœnicians, and Sanir or Senir by the Amorites, on the east of Jordan. It is also called Sion by Moses, but must not be confounded with the Sion of Jerusalem. By the Sidonians it was called Scirion; in the Vulgate it is called Sarion. Joshua informs us that it was the dominion of Og, king of Bashan; which must be understood of its south side. It is never particularly mentioned by profane writers, being comprised under Libanus, or Antilibanus, with which it is joined on the east. It is also called Hermonim, plurally, Psalm xlii. 6, because it was extensive, and contained several mountains.

HERMUND, or HELMUND, a river of Afghaunistam, the Etymander of Arian. It rises to the west of Cabul, and, running to the south-west, is joined by the Urghundab, and empties itself, after a course of 360 miles, into the sea of Zerra, or Aria Pales. It is in general fordable, but, in winter, is very deep and broad. There was formerly an embankment, called the Bundi Rustem, across this stream; from which, perhaps, it was said to lose itself in the sands.

HERMUS, in ancient geography, a river of Ionia; which, rising near Dorylæum, a town of Phrygia, in a mountain sacred to Cybele, touched Mysia, and ran through the Regio Combusta, then through the plains of Smyrna down to the sea, carrying along with it the waters of the Pactolus, Hyllus, and other rivers. It was said, by Virgil and other poets, to roll down gold.

Virgil and other poets, to roll down gold. HERN, n. s. Contracted from HERON; which see.

Birds that are most easy to be drawn are the mallard, swan, hern, and bittern. Peacham.

The towering hawk, let future poets sing,

Who terror bears upon his soaring wing;

Let them on high the frighted hern survey, And lofty numbers paint their airy fray.

HERNANDEZ (Francis), a naturalist and physician, who was sent out by Philip II., king of Spain, to make observations on, and to de-

Gay.

scribe, the natural productions of Spanish America. His pecuniary allowance for this purpose appears to have been ample; and he spared no expense to make himself acquainted with such objects as he was in search of. He wrote an account of their nature and properties, but it does not appear that he lived to superintend the publication of his labors; for in 1651 the result of his enquiries was edited at Rome, under the care of the Lyncæan Academy, established in that city; the papers of Hernandez having been purchased by Frederic Cesi, a young nobleman who founded, and was perpetual president of the This work had originally been pub-Lyncæi. lished in the Spanish language at Mexico, under the name and care of Francis Ximenes but the Roman edition, in small folio, came out in Latin, having the following title, 'Nova Plantarum, Animalium et Mineralium Mexicanorum Historia, a Francisco Hernandez, Medico in Indiis Præstantissimo, primum Compilata.' The original drawings of this work were procured by Hernandez, who payed the immense sum of 60,000 ducats for them; they had been drawn at the time when Joseph à Costa was in America; but the numerous wood-cuts which accompany this volume are by no means equal to what might have been expected from the account we have of the drawings; and this called forth an observation of regret from Linnæus, that the work did not answer the trouble and expense which had been bestowed upon it. It must, however, be remarked, that no blame should attach to the memory of Hernandez, but to his editors on this account. What became of him is not recorded, but his drawings were consumed by a fire in the Escurial. Among the figures are some curious animals; but the plants com-pose the chief bulk of the work. Some of his representations are so extraordinary that their truth have been doubted; for intance, his macpalxochiquahvitl, the form of which is so strange that some error was reasonably expected. His accuracy, however, has lately been verified even in this instance. The plant, whose large united stamens exactly resemble a bird's foot, is of the malvaceous order, and is recently figured in a splendid French work. A specimen of this plant is preserved in spirits at Sir Joseph Banks's. Hernandez does not appear to have published any other works on natural history; but this will entitle him to our gratitude, for having first unfolded to European botanists the treasures of that then little known quarter of the world. The Mexican names are always given, and his medical observations are general and good. A history of the church of Mexico has been ascribed to our author, but without certainty.

HERNANDRIA, Jack-in-a-box tree: a genus of the trandria order, and monœcia class of plants; natural order thirty-eighth, tricoccæ: MALE CAL. tripartite: coR. tripetalous; FEMALE CAL. truncated, quite entire: coR. hexapetalous; the plum hollow, and open at the mouth or upper part, with a loose kernel. 1. H. ovigera, grows many feet high, garnished with large oval leaves, not peltated; and monœcious flowers, succeeded by swollen fruit, open at the end, and a nut within. 2. H. sonora, or common Jackin-a-box, is a native of both the Indies. It grows twenty or thirty feet high, and is garnished with broad peltated leaves, and monœcious flowers, succeeded by a large swollen hollow fruit, formed of the calyx, having a hole or opening at the end, and a hard nut within. The wind blowing into the cavity of this fruit makes a very whistling and rattling noise, whence the name. Both these species, being tender exotics, must be planted in pots of rich earth, and always kept in a hot-house; in which, notwithstanding all the care that can be taken, they seldom flower, and never grow beyond the height of common shrubs, though in the places where they are natives they arrive at the height of trees. They are propagated by seeds procured from the West Indies.

HE'RNIA, n. s. Latin. Any kind of rupture, diversified by the name of the part affected.

A hernia would certainly succeed. Wiseman.

HERNIA, in medicine, from Greek sprog, a branch, is the name by which surgical writers distinguish the disease more commonly and vulgarly called a rupture, from a false idea that the case is attended with a laceration of the peritonæum. Sir Astley Cooper defines it as 'a preternatural tumor occasioned by some of the viscera of the abdomen being displaced out of that cavity.' The places in which these swellings most frequently make their appearance are the groin, the navel, the labia pudendi, and the upper and fore part of the thigh; they occur at every point of the anterior part of the abdomen, and there are several less common instances in which hernial tumors present themselves at the foramen ovale in the perinæum, in the vagina at the eschiatic notch.

If the situation of such tumors be various, the viscera which produce them are still more so ; instances having occurred of the stomach, uterus, liver, spleen, and bladder, being found to form their contents. But a part of the intestina. canal, or a portion of the omentum, are from experience known to be the most frequent cause of their formation. From these circumstances of situation and contents, all the different appellations are derived by which herniæ are distinguished. Thus they are termed inguinal, scrotal, femoral, umbilical, and ventral; from their appearing in the groin, scrotum, thigh, navel, or belly. When the tumor is confined to the groin, the hernia is said to be incomplete, and is termed bubonocele; but, when the swelling reaches down to the bottom of the scrotum, the rupture is then supposed to be complete, and the disease obtains the name of scrotal rupture, or oscheocele.

Of these disorders, the inguinal hernia is by much the most frequent; next to that is the femoral. The umbilical is seldom observed in men, or even in women who have not borne children. The causes which tend to the production of hernia in its more usual form are these: 1. The containing parts of the abdomen are elastic and compressible; whatever, therefore, tends to produce a diminution of capacity, in the cavity of the abdomen, must occasion a proportional degree 'of risk of some of the contained parts being pushed from their natural situations. Violent coughing, crying, laughter, or great bodily exertion, are attended with more or less contraction of the abdominal muscles, and particularly of the diaphragin; and, as the contraction of these muscles must always diminish the abdominal cavity, these causes therefore are frequently productive of hernia. 2. Falls, in consequence of the derangement they produce in the abdominal viscera, from the sudden and violent shock with which they are often attended, are often the immediate causes of hernia. 3. Persons of a preternatural laxity of frame are very liable to hernia. The containing parts of the abdomen, from the want of a sufficient tone and firmness, are unable in such people to resist on all occasions the weight of the different viscera; and they are therefore more particularly exposed to disorders of this kind on the slightest application of any of the causes already mentioned.

In whatever situation a protrusion of any portion of the intestines occurs, except in the hernia congenita, as all the viscera are contained within the peritonæum, a portion of that membrane, it is evident, must be carried down together with the parts protruded; and, in every such instance, it is this portion of the peritonaum which goes down along with the gut that is termed the hernial sac. The size of this sac is various in different subjects, and in different stages of the same disorder. On the first appearance of the disease it is commonly of no very considerable size, as such swellings seldom acquire any great bulk at once; but, by repeated descents of the bowels, it comes to be pushed lower and lower, till in some instances its bulk becomes very considerable indeed; and when, in this advanced period of the disorder, the sac happens to be laid open, it is found to contain either large quantities of omentum or intestine, and frequently large portions of each. As the peritonaum has this property, in common with many other parts of the body, of thickening according to the degree of any gradual extension applied to it, so in many instances the thickness and firmness of the hernial sac are often very enormous.

All the bad symptoms which are found to occur in herniæ, proceed, as may be readily supposed, either from obstruction to the passage of the fæces when the intestinal canal forms the tumor, or from a stoppage of circulation occasioned by stricture on the prolapsed parts; so that the attending symptoms, it is evident, will be always more or less hazardous according to the nature of the parts so protruded. Thus, when the omentum alone forms the substance of hernial swellings, as that organ does not appear to be so immediately necessary as many of the other viscera, such tumors are not so frequently productive of bad consequences; at least they are seldom in any degree so hazardous as when a part of the alimentary canal is either protruded by itself or along with the omentum.

Although this, however, is in general the case, yet it sometimes happens, that even an omental rupture is productive of no small degree of danger. When a stricture so complete upon it occurs as to occasion a stoppage of circulation in the protruded part, mortification with all its bad consequences must be the certain event : and the connexion between the omentum, stomach, and other viscera, is such, that a sudden Vol. XI.

descent of any considerable portion of the former, sometimes brings on vomiting, hickup, and other troublesome symptoms; and, lastly, though a rupture containing omentum only might not of itself produce any thing bad; yet, as the passage through which the omentum has slipped must of necessity continue open so long as that viscus remains protruded, and as that circumstance alone must, so long as it continues, render it more easy for a portion of intestine likewise to get down, this of itself is a sufficient reason for entitling even this species of heruia to the serious attention of practitioners.

But whatever the contents of such swellings may be, as their remaining in some instances for a considerable length of time without being productive of any bad symptoms must proceed entirely from the circulation continuing to go freely on, notwithstanding the derangement of parts; so, whenever a stricture occurs up the protruded viscera, sufficient to produce either a stoppage of the circulation or of the fæcal contents of the alimentary canal, when a portion of intestine forms the disease, the following in general are the symptoms which accrue :—

An elastic colorless swelling is observed at the part affected; a slight pain is felt, not only in the swelling itself, but, if part of the alimentary canal is down, a universal uneasiness is perceived over the whole abdomen; and this pain is always rendered worse by coughing, sneezing, or any violent exertion. The patient complains of nausea; frequent retching; can get no discharge by stool; becomes hot and restless; and the pulse is commonly quick and hard. When the swelling is formed entirely by a portion of intestine, if no faces be contained in it, it has a smooth, equal surface, and is easily compressible, but instantly returns to its former size on its pressure being removed ; but, in ruptures of long standing, where hard fæces have collected in the protruded howels, considerable inequalities are detected. When again the tumor is composed both of intestine and omentum, its appearance is always unequal, it feels soft and somewhat like dough, and of course is not so elastic as when part of the intestinal tube only is down; for although, like the other, it is compressible, it does not so readily regain its former dimensions on the pressure being taken off.

These symptoms can never happen from the presence of omentum only; for although stricture produced on a portion of omentum, even when no part of the intestinal tube is down, does now and then occasion a good deal of distress, such as pain in the part, sickness, vomiting, and twitching pains through the whole belly; yet no obstruction ever occurs from this, and of course none of the symptoms ever prove so alarming as when any part of the gut is affected. If these symptoms we have described, as being produced by a strangulated bowel, are not now obviated by a removal of the stricture which produced them, the nausea and retching terminate in frequent vomitings, first of a bilious, and afterwards of a more fetid matter; the belly becomes tense; the pain turns more violent; a distressive convulsive hickup comes on ; the fever, which before was not apparently of much consequence, now becomes very formidable; and a total want of rest, with a very disagreeable state of anxiety, continues through the whole course of the complaint. These symptoms having gone on with violence for some time, the patient is at last commonly relieved in a sudden from all manner of pain; and then he flatters himself that all danger is over. But instead of that, the pulse, from having been hard and frequent, becomes languid and interrupted; cold sweats break out over the whole body; but especially on the extremities; the eyes acquire a kind of languor; the tenseness of the abdomen subsides, and the swelling of the part affected disappears; the teguments covering the parts, which before were either of a natural appearance or had somewhat of a reddish inflamed cast, now acquire a livid hue, and a windy crepitous feel is distinguishable all over the course of the swelling. If the protruded parts have not of themselves gone entirely up, their return is now in general easily effected by a small degree of pressure, and the patient then discharges freely by stool; but the cold sweats increasing, the hickup turns more violent, and death itself is at last ushered in by its usual forerunners, subsultus tendinum, and other convulsive twitchings.

These are the ordinary symptoms of what is termed a strangulated or incarcerated gut-hernia; that is, when the parts protruded become so affected by stricture as to produce pain; and do not either return to their natural situations on the patient's getting into a horizontal posture, or cannot even be immediately replaced by the hands of a practitioner. In whatever situation a strangulated hernia occurs, the only rational method of cure, it is evident, must consist in the removal of that stricture which prevents the return of the protruded parts. It is that stricture which ought to be considered as the cause of all the mischief; and, unless it be removed, nothing effectual can be done for the relief of the patient.

As soon as the assistance of a practitioner is desired for the removal of symptoms in cases of hernia, the first circumstance requiring his attention is the placing of his patient in such a posture as will most probably favor the return of the protruded parts. Placing the patient's feet over the shoulders of another person, while his body is allowed to hang downwards, has on some occasions answered when other means have failed. The surgeon should at the same time endeavour to assist the return of the bowels, by means of gentle pressure with his hands and fingers. In the inguinal or scrotal hernia, this pressure should be made obliquely upwards and outwards, to correspond with the opening in the external oblique muscle; in the femoral hernia it ought to be made directly upwards; in the umbilical and ventral hernia, directly backwards .- The swelling should be grasped with one hand at the bottom, while with the fingers of the other hand an attempt is made to push gently the contents of the tumor into their place, always observing that the parts last protruded he first reduced. This operation is by authors termed the taxis

When the means now mentioned have failed,

no remedy affords more relief than blood-letting. The quantity to be drawn ought chiefly to be determined by the strength of the patient. There is scarcely any disease, however, where such large quantities of blood can with propriety be taken from weak people. Bleeding, till the patient is in a state of deliquium animi, is frequently known to produce a more effectual relaxation of the muscles than can be done by any other means. On that account it is sometimes advised in cases of hernia, and the practice is now and then attended with advantage.

If, however, all these endeavours prove ineffectual; if the swelling is not reduced, but still presents an inflamed tense surface; if the fever still continues and even becomes worse, the operation of dividing the parts producing the stricture can alone save the life of the patient. To determine the exact time at which to proceed to an operation has been considered as one of the nicest points in surgery. In general, when every attempt has failed, and no repetition of the former remedies is likely to succeed, the surgeon ought certainly to proceed to the operation. A few hours, even when assistance has been early applied, is perhaps all the time which ought ever to be consumed in trials of this nature. But however necessary this operation may be when a patient's life is in danger, as it is always attended with some degree of hazard, it ought never to be practised where symptoms of strangulation do not exist.

In that kind of hernia called chronic, the circulation of the part forming the hernia, as well as the peristaltic motion of such parts of the alimentary canal as have been protruded, go freely and regularly on. There are many instances of large herniæ falling down even to the bottom of the scrotum, and continuing there for many years, without producing any interruption to the usual discharge by stool. All that can be done here is to prevent any accumulation of fæces in the intestine, by prescribing a proper diet, and the occasional use of gentle laxatives; and obviating any inconvenience which might arise from the weight of the tumor, by the application of a proper truss or suspensory bandage; to warn them of the risk to which they are constantly liable, and to caution them against violent exercise, particularly leaping, and every sudden exertion. The truss ought to be fitted exactly to the part for which it is intended; for, without the utmost nicety in this respect, it must always do more harm than good : for the sole purpose of a bandage, in cases of hernia, is to prevent effec-tually the falling down of such parts as have been newly replaced. If therefore the pad or bolster of the bandage does not bear properly against the opening upon which it is placed, a portion of gut may slip out, and be materially injured by the pressure of the pad.

The circumstances to be attended to in performing the operation for hernia, in general, are these. A table of convenient size and height being placed in a proper light, the patient must be so laid on it as to relax the diseased parts as much as possible, and then secured by proper assistance. To lessen the contents of the abdomen as much as possible, the bladder ought to be

emptied previous to the operation. An incision is to be made with a common round-edged scalpel through the skin and part of the cellular substance, long enough to allow the stricture to be fully exposed. The rest of the cellular substance is then to be divided with the greatest attention. That part of the muscle forming the stricture or ring must next be laid distinctly in view. A small portion of the protruding sac must also be exposed : after which the directory is to be passed between the ring and the sac. A straight probe-pointed scalpel is now to be introduced into the groove of the directory, and by it the ring is to be dilated till the point of the finger can be introduced. The finger is here considered as the safest director; for, it being insinuated into the aperture in the tendon immediately above the protruded parts, the point of the knife is easily introduced upon it; and, by keeping the end of the finger always a little before the knife, the opening may be enlarged to any necessary extent without risk of wounding any of the contiguous parts.

By the ease with which the finger is introduced, the operator will be enabled to judge when the ring is sufficiently dilated; and, if the strangulation was entirely in the ring, it will now be evident that every obstacle to the reduction must be removed, and of consequence that the prolapsed parts may be returned with little difficulty. If the patient be young, or if the disease has continued a considerable time, such a degree of inflammation frequently ensues in the neck of the sac as to produce thickening and straitness; so that, after the sac and its contents have been entirely freed from the stricture of the ring, the intestines cannot be reduced. We judge this to be the case when, after the stricture of the ring has been removed, the parts prolapsed do not expand into their natural size, and farther, when they make resistance when we attempt to return them. In this case the neck of the sac must be opened with the utmost caution, to avoid wounding the parts within it.

If the herniary sac, under the straitened place of its neck, be thin and transparent, and there is little or no reason to suspect an adhesion of the bowels to the sac, the best method, as Dr. Monro, in his publication on the Bursæ Mucosæ, observes, will be to make a small hole in the sac below the stricture, and then to introduce a small furrowed probe, and to cut cautiously upon it. But if the sac be thick and dark colored, and there is likewise a suspicion that the bowels may adhere to it, the easiest and safest manner will be to make the hole in the peritonæum above the stricture; then to introduce a common probe, bent near its point into a semicircle, with its point directed downwards through the strictures, into the sac; and upon the point of it to make, with great caution, another small hole; after which we may either cut upon the probe, or introduce a furrowed probe, and divide the neck of the sac.

After this, the bowels are to be returned by pressure upon the sac, without opening it farther; and the sides of the wound in the skin are to be brought together, and kept so by means of slips of adhesive plaster, though stitches made at the distance of a finger's breadth from each other will exclude the air, and prevent the return of the bowels more effectually. Over these are to be laid several folds of charpie, and the whole is to be secured by a bandage adapted to the nature of the part.

When the hernia is of long standing, and when there is reason to think adhesions have taken place between the sac and bowels, or that mortification has already begun, or that some filaments run across the sac and prevent the reduction, or that there is water in the sac, or that the gut is in danger of being entangled from a part of the omentum being down, a different method of operating becomes necessary.

The patient is to be placed as already directed. The operator is to grasp the tumor with the one hand, so as to make the skin tense on the fore part of it, while with the scalpel in the other he divides the skin from one end of the tumor to the other. The cellular substance is by gentle strokes to be divided, till not only the ring, but the whole length of the sac, is laid bare. An opening is now, in the most cautious manner, to be made into the sac by slight scratches, to avoid hurting any of its contents. In making this perforation, which is considered as the nicest part of the operation, considerable assistance is obtained from the use of the small directory, upon the point of which the fibres of the sac are to be successively raised and divided till an opening is made. The opening is to be enlarged till it admit the fore finger of the left hand, which serves as a directory for conducting the straight probe-pointed scalpel with which the sac is to be divided through its whole length. The sac being laid fully open, the parts contained in it ought to be examined with the nicest attention, to discover whether they are all sound or not; and if, upon any attentive inspection, it is found that they are not evidently in a gangrenous state, even although they seem considerably inflamed, they should be immediately returned into the abdomen. When adhesions take place between different parts of the protruded gut, the greatest caution is necessary in separating them. When the bowels cannot be reduced with ease, the ring is to be dilated by the blunt-pointed scalpel in the manner already directed. But in case gangrene or mortification is already begun all these parts must be cut away, as the return of such into the cavity of the abdomen must be generally attended with the worst consequences. We now come to notice.

THE HERNIA INGUINALIS OR BUBONOCELE.

This species of hernia is formed by a protrusion of some of the abdominal bowels through the rings of the external oblique muscles. It is known by the general symptoms of hernia already enumerated, and by a soft and somewhat elastic swelling, beginning in the groin, and descending by degrees into the scrotum in men, and into the labia pudendi in women. When the hernia contains omentum only, the swelling is both more soft, compressible, and more unequal than when the gut alone is down; the scrotum becomes more oblong than in the intestinal hernia; and, when the quantity of omentum P 2 is large, it is also much more weighty than a gut rupture of the same size; but frequently the tumor is composed of both gut and omentum, and then the distinguishing symptoms of each can never be so clearly marked.

Bubonocele may be confounded with certain other diseases; but may be distinguished by the following marks which are present in these disorders, while the symptoms of hernia are absent : from venereal bubo, by the presence of that incompressible hardness with which all such swellings are at first attended, and by the fluidity of matter which in the suppurative state is always observable : from hernia humeralis, or swelling of the testes, by the absence of the hardened and enlarged state of the testis and epidydimus, and likewise of the pain, the tumor of the testicle being remarkably heavy in proportion to the hulk, the spermatic process being commonly free from the swelling. In the hernia humeralis, also, the intestines are unobstructed, and the general symptoms of hernia are wanting. From the hydrocele of the tunica vaginalis testis, by the tumor generally feeling more smooth to the touch than in hernia, by the swelling here beginning in the under part of the scrotum and ascending, by the spermatic cord being always free and distinct, and by a fluctuation being evident. From hydrocele of the spermatic cord, sometimes with much difficulty, and therefore it requires here particular attention. In every case of tumor in the testes where the most perfect certainty is not obtained, and when it is necessary to have recourse to an operation, the surgeon ought to proceed as in a case of real hernia.

The treatment of bubonecele is the same with that already advised in the treatment of hernia in general, only making allowance for the situation of the disease. In attempting the reduction by means of the hand, the pressure should be obliquely upwards and outwards, corresponding with the ring of the abdominal muscle. In performing the operation, the patient should be laid on a table, with his head and body almost borizontal, whilst at the same time his buttocks are somewhat elevated by pillows placed beneath them. The legs hanging over the edge of the table ought to be separated, so as to admit the operator between them; and should in that situation he firmly secured by an assistant on each side, who should take care to keep the thighs so far raised as to relax all the abdominal muscles. The parts being previously shaved, an incision must be made with a common roundedged scalpel through the skin and part of the cellular substance, beginning at least an inch above the superior end of the tumor, and continuing it down to between two and three inches below the ring. Although, in by much the greatest proportion of hernial swellings, the spermatic vessels lie behind the protruded parts, yet on some occasions they have been found on the anterior part of the tumor; so that in order to avoid the risk of wounding them, as soon as the skin is divided, the remainder of the operation should be performed in the most cautious manner, care being taken to avoid every large bloodvessel which makes its appearance. The ring

must now he laid distinctly in view; a small portion of the protruding sac must also be exposed; after which the directory is to be introduced between the ring and the sac, placing the point of the instrument obliquely upwards and outwards. A blunt-pointed bistoury is now to be introduced into the groove of the directory, and by it the ring is to be dilated till the point of the finger can be introduced. The directory is now to be laid aside, and the finger used in place of it through the rest of the operation. After the operation is finished the dressings are to be applied, and the whole secured by a T bandage, or suspensory bag, properly stuffed with soft lint.

OF HERNIA CONGENITA.

The testes in the foctus are, till near the time of delivery, lodged in the cavity of the abdomen. When they descend into the scrotum, they push before them a portion of the peritonæum, which afterwards forms the vaginal coat. The passages by which they descend are soon shut up; but sometimes a portion of some of the abdominal viscera, passing down, forms that species of hernia to which new born infants are liable, termed by Haller the hernia congenita. The testicle and protruded intestine being here in contact with one another, the tunica vaginalis testis forms the hernial sac. A hernia congenita may be distinguished in an adult by the bowels pushing down between the sac and the fore part and sides of the testicle, so as often in a great measure to conceal it ; whereas, in the common hernia, every part of the testicle can be felt distinctly; and it is of material use to make the distinction, because in whatever manner we operate in hernia congenita, unless we take the utmost care to exclude the air, there will be a more violent inflammation and greater distress than in common cases, because the testicle will partake of the inflammation. In the treatment of ruptures, of the congenital kind, little difference occurs from the management of the common scrotal hernia; only a truss ought never to be applied to infants, unless the testicle can be felt in the scrotum, after the contents of the hernia have been reduced ; as it would entirely prevent the descent of the testicle, which yet remains in the abdomen.

OF HERNIA CRURALIS, OR FEMORAL HERNIA.

The seat of this species of hernia is upon the upper and fore part of the thigh; the protruded bowels passing out at the same opening through which the large blood-vessels of the thigh are transmitted from the abdomen, and of consequence under that part of the tendon at the under end of the abdomen known by the name of Poupart's or Fallopius's ligament. Sometimes the bowels which protrude are situated immediately over the femoral vessels, sometimes on the outside of these, hut more frequently they lie upon their inner side. The disease is more frequent in women than in men, on account of the width of the female pelvis, and of conse-quence the length and laxity of the ligament. The femoral hernia is more in danger of being confounded with inguinal hernia than with any other; the tumor, however, is deeper, and the

ring of the abdominal muscle, which lies entirely above the tumor in femoral hernia, completely surrounds the parts in that of the inguinal kind. In the treatment of femoral hernia, when symptoms of strangulation occur, we must use all the remedies commonly practised for hernia in general; only that here, in attempting to reduce the parts by the hand, the pressure should be made directly upwards. An incision of sufficient length is to be made through the integuments, so as to allow that part of the tendon which forms the stricture to be laid fairly in view; and, after dividing the integuments, we are cautiously to cut the fascia lata of the thigh, and separate any glands which may come in the way till the stricture and part of the sac distinctly appear. The stricture is then to be divided, by cutting fibre after fibre successively. The spermatic vessels in the male, or round ligament in the uterus in the female, may be avoided by cutting in a direction towards the umbilicus, carefully dividing the tendon transversely. Some authors, from a sense of the danger attending this part of the operation, have recommended merely to dilate the passage, instead of dividing the tendon; but, in such a situation, to attempt a farther dilatation without the assistance of the knife, would probably be seldom attended with any advantage. After the parts are reduced, the wound is to be dressed as directed in the treatment of hernia in general; a piece of thin leather spread with some adhesive plaster retains the dressings better, and with much more ease, than any other bandage.

In exomphalos, or umbilical hernia, the parts protruded pass out at the umbilicus, and are commonly the intestines, or omentum, or both; sometimes part of the stomach, the liver, and even the spleen, have been found in the sac. Here, as in other ruptures, the peritonæum forms the sac, and in recent cases it is generally very evident; but by the size of its contents, or a long continuance of the disorder, it sometimes becomes so connected with the surrounding parts, that by many its existence has been doubted. and sometimes the swelling has increased to such a degree as to burst even the skin itself. The disease occurs most frequently in infancy, soon after birth. In the adult state, corpulent people are more subject to it than those of a contrary habit; and pregnant women are particularly subject to it, on account of the size of the uterus.

The diagnosis in this disease is readily made, as the disorder can scarcely be confounded with any other. If the disease be attended to in due time, a bandage properly fitted will generally effect a cure; and, in such swellings as occur in pregnancy, delivery will commonly remove the disorder: but, even in cases of pregnant women, a bandage early applied and properly used will give considerable relief, till a cure can be obtained by delivery. In this disease the omentum is more frequently pushed out than any other viscus; hence umbilical herniæ in general are not productive of such bad symptoms as usually occur in the other kinds of rupture. When, however, the intestines protrude, the usual symptoms of a strangulated hernia are apt

to be induced, and, when the means usually employed for returning the intestine into the abdomen do not succeed, a cure, it is evident, must depend entirely on a thorough removal of the stricture. In performing this operation, an incision through the integuments is the first step to be taken, so as to expose the stricture of the tendon and the neck of the sac. The stricture is to be removed in the manner already described; and, as the tendon completely surrounds the neck of the sac, the stricture may be cut wherever it can be most readily dilated. A radical cure, similar to that for the other species, has been proposed, but with as little probability of success,

Ventral rupture is a protrusion of some of the bowels through the interstices of the abdominal muscles, and is most frequently observed in some of the parts most contiguous to the linea alba. The treatment of this species of disease is exactly the same with that of exomphalos, or the rupture of the navel.

Cystic hernia, or hernia of the bladder, though less frequent than that of the omentum or intestines, is not very uncommon. The situation in which it occurs is in the groin, through the abdominal ring, in the fore-part of the thigh, under Poupart's ligament, so as to form inguinal or crural hernia. Instances have likewise occurred of the bladder being pushed into the perinæum. Sometimes it occurs by itself, without any complication; at other times it is accompanied with intestines and omentum, both in ingunal and femoral herniæ; when complicated with bubonocele, the protruded part of the bladder is situated between the intestine and spermatic chord.

The usual symptoms are a tumor, attended with fluctuation either in the groin, in the fore part of the thigh, or perinæum, which generally subsides when the patient voids urine. When the swelling is large, before water can be made with freedom it is commonly necessary to have recourse to pressure, at the same time that the tumor, when in the groin or thigh, is as much elevated as possible, but when the swelling is small, and especially when no stricture is as yet produced, the patient generally makes water with great ease, and without any assistance from external pressure. When the disease occurs, without any complication, it is commonly owing to a suppression of urine. In the diagnosis, care must be taken not to mistake it for a hydrocele. In recent cases, the part protruding may in general be easily reduced, especially if we attend to the suppression of urine, which probably gave rise to the disease. A proper truss ought afterwards to be worn for a long time. When the disease has been of long standing, adhesion takes place between the bladder and cellular substance of the scrotum. In this case, therefore, as long as no symptoms occur to render the operation necessary, a suspensory bandage, so fitted as effectually to support the prolapsed part, is the only probable means of relief. Sometimes the bladder, owing to a suppression of urine, at other times part of the intestines, have been found to protrude through the vagina. This is called hernia vaginalis. In the former case a fluctuation of water is perceptible to the touch. The reduction is made by laying the patient on her back, with her loins somewhat raised, and pressing with the fore finger from the vagina. Descents may in future be generally prevented, by evacuating the urine often, and by the use of a pessary introduced into the vagina. Nearly the same means are employed in reducing the intestine, when it is found to protrude.

HERNIARIA, rupture-wort; a genus of the digynia order, and pentandria class of plants; natural order eleventh, sarmentaceæ: cAL quinquepartite; there are five barren stamina, and a monospermous capsule: con. none. The most remarkable species is the H. glabra, or smooth rupture-wort, a native of many parts of England. It is a low trailing plant, with leaves like the smaller chickweed; the flowers come out in clusters from the side of the stalks at the joints, and are of a yellowish-green color. This plant is a little saltish and astringent. Cows, sheep, and horses, eat it; goats and swine refuse it.

HERNOSAND, an extensive government in the north of Sweden, comprising the provinces of Angermannland, Jemptland, and Medelpad. Its territorial extent is 18,000 square miles, but so thin is the population that the whole does not exceed 100,000. The country is well wooded.

HERNOSAND, or ILERNOSUND, a town in the north of Sweden, in Angermannland, the capital of the foregoing government, and a bishop's see. It stands on the island of Herno, in the Gulf of Bothnia, and is united to the continent by a bridge. It has a college with seven teachers, and from sixty to ceventy students: a botanical garden; and a good harbour. It was formerly a staple town, and its trade in linen is still very considerable. It has suffered repeatedly from the Russians: and is 240 miles north by west of Stockholm. Population 2500.

HE'RO, n. s.	Lat. heros; Gr. ypwg.
HE'ROESS, n. s.	A man eminent for bra-
HERO'ICAL, adj.	very; or in any other
HERO'ICALLY, adv.	respect, as a hero in
HERO'IC, adj.	learning: heroess, he-
HERO'ICLY, adv.	roine, a female hero:
Her'oint, n.s.	heroical, noble; brave;
HER'OISM, n. s.	illustrious; productive

of heroes: heroism, the qualities and character of a hero.

Bolingbroke From John of Gaunt doth bring his pedigree, Being but the fourth of that heroick line. Shakspeare. In which were held, by sad disease, Heroes and heroesses. Chapman. Verse makes heroick virtue live, But you can life to verses give. Waller. I sing of heroes, and of kings, In mighty numbers mighty things. Cowley. Methinks heroick poesy, 'till now Like some fantastic fairy land did show. Id. These sure, said I, will me obey ; These sure heroick notes will play. Id. Not that which justly gives heroick name Milton. To person, or to poem. Samson hath quit himself Like Samson, and heroickly hath finished Id. A life heroick.

HER

And few indeed can parallel our climes For worth heroic or heroic crimes. Marvell. Not heroically in killing his tyrannical cousin.

Sidney. Musidorus was famous over all Asia for his heroical

enterprizes. Id.

An *heroick* poem is the greatest work which the soul of man is capable to perform : the design of it is to form the mind to *heroick* virtue by example.

Dryden. Though you have courage in an heroical degree, I ascribe it to you as your second attribute. Id.

I have chosen the most *heroick* subject which any poet could desire: I have taken upon me to describe the motives, the beginning, progress and successes of a most just and necessary war. *Id.*

But inborn worth, that fortune can control, New-strung, and stiffer bent her softer soul; The *heroine* assumed the woman's place,

Confirmed her mind, and fortified her face.

Free from all meaning, whether good or bad;

And, in one word, heroically mad. Id. Yet when some virtue much outgrows the rest,

It shoots too fast, and high to be expressed,

As his heroic worth struck envy dumb

Who took the Dutchman, and who cut the boom. Id. Then shall the British stage

More noble characters expose to view,

And draw her finished heroines from you. Addison.

Onward they march embattled to the sound

Of martial harmony; fifes, cornets, drums,

That rouse the sleepy soul to arms and bold

Heroic deeds. Somerville's Chase. Heroes in animated marble frown. Pope.

Heroes in animated marble frown. Pope. These are thy honors, not that here thy bust

Is mixed with heroes, or with kings thy dust. Id.

In this view he ceases to be an hero, and his return is no longer a virtue. Id. Odyssey.

If the Odyssey he less noble than the Iliad, it is more instructive; the Iliad abounds with more *he*roism, this with more morality. Broome.

Why should we kill the best of passions love? It aids the *hero*, bids ambition rise

To nohler heights, inspires immortal deeds,

Ev'n softens brutes, and adds a grace to virtue.

Thomson.

Couver.

The solitary silent solemn scene

Where Cæsars, heroes, peasants, hermits, lie Blended in dust together. Dyer.

Some write a narrative of wars and feats Of *herocs* little known, and call the rant

An history.

Heroes alas! are things of small concern;

Could history man's secret heart reveal

And what imports a heaven-born mind to learn

ller transcripts to explore what bosom would not yearn? Beattie.

An hour ago you would have given your soul To look like other men, and now you pause To wear the form of *heroes*.

Byron. The Deformed Transformed.

A HERO, in Pagan mythology, was a great and illustrious person, of a mortal nature, but supposed, after his death, to partake of immortality, and to be placed among the number of the gods. The Greeks erected columns and other monuments over the tombs of their heroes, and established a kind of worship in honor of the names both of their heroes and heroines. The Romans also raised statues in honor of their heroes; but there were six of a superior order, who were

.

supposed to be admitted into the community of the twelve great gods, viz. Hercules, Bacchus, Æsculapius, Romulus, Castor, and Pollux. Authors distinguish between the worship which the ancients paid to their heroes, and that offered to their gods. The latter consisted of sacrifices and libations; the former was only a kind of funeral honor, in which they celebrated their exploits, concluding the rehearsal with feasts.

The HERO OF A POEM, OF ROMANCE, is the principal personage, or he who acts the chief part of it. Thus the hero of the Iliad is Achilles; of the Odyssey, Ulysses; of the Æneid, Æneas; of Tasso's Jerusalem, Godfrey of Bulloign.

HERO, in fabulous history, a famous priestess of Venus, who lived at Abydos, in a tower on the banks of the Hellespont. Leander her lover, who lived at Sestos on the other side of the strait, every night swam over to visit her, being directed by a light fixed on the tower. But the light being put out in a stormy night, the youth missed his way, and was drowned; on which Hero threw herself into the sea, and perished.

HERO, THE OLD, and HERO, THE YOUNG, two celebrated Greek mathematicians. The latter was a disciple of Ctesibius. Their works were translated into Latin by Borochius; Spiralium Liber, by Hero senior; and Tractat. artis et machin. militar. by Hero junior. They flourished about A. A. C. 130 and 100.

HERO, NORTH and SOUTH, two islands of Lake Champlain. On the former, thirteen miles in length and two in breadth, is a township annexed to Chittenden county, Vermont. South Hero is an island on the same lake, belonging also to that county. It is ten miles long and five broad, and produces good grain crops. There is also a quarry in it of gray marble, which has the appearance of being a petrifaction of scallops, a species of shell common in this vicinity.

HEROD, improperly styled the Great, tyrant of Judæa, was born at Asealon, about A.A.C. 68. His father, Antipater the Idumean, or Edomite, appointed him governor of Galilee: Mark Antony made him tetrarch, or ethnarch; and he afterwards obtained the kingdom of Judæa, which was confirmed to him by Augustus, a short time before the birth of our Saviour. At the birth of our Lord, in the vain hope of cutting off the Messiah, he caused all the infants of Bethlehem under two years of age to be massacred. His barbarity was as fatal to his own family as to his subjects; for he murdered his beautiful wife Mariamne, her mother Alexandra, her brother Aristobulus, her grandfather Hyrcanus II., and his own sons Alexander and Aristobulus; which led the emperor Augustus to say, that it was better to be Herod's swine than his sons. He died miserably within three years after the birth of Christ, aged seventy.

HEROD AGRIPPA I. and H. See AGRIPPA. HEROD ANTIPAS, the son of Herod the Great, by his wife Cleopatra, a native of Jerusalem. Herod, in his will, named his son Archelaus his successor, giving Antipas the title of Tetrarch of Galilee and Peræa. Antipas adorned and fortified the principal places of his dominions. He married the daughter of Aretas king of Arabia; whom he divorced about A. D. 33, to marry his sister-in-law Herodias, wife to his brother Philip, who was still living. St. John the Baptist, ex-claiming against this incest and adultery, was imprisoned in the eastle of Machærus; and afterwards beheaded by Herod's order, as recorded in Mat. xiv., Mark vi. and Luke iii. Aretas, to revenge the affront which Herod had offered to his daughter, declared war against him, and overcame him in a very obstinate engagement. Herod, being afterwards detected as a party in Sejanus's conspiracy, was banished by the emperor Caligula into Lyons in Gaul, whither Herodias accompanied him. This Antipas is the Herod who, being at Jerusalem at the time of our Saviour's passion (Luke xxiii. 11), ridiculed him, by dressing him in a white robe, and sending him back to Pilate, as a mock king, whose ambition gave him no umbrage. The time when he died is not known, but it is certain he died

died in Spain. HERODIAN, an eminent Greek historian, who flourished at Rome in the third century, in the reigns of Severus, Caracalla, Heliogabalus, Alexander, and Maximin. His history begins from the death of Marcus Aurelius the philosopher, and ends with those of Balbinus and Maximin, and the beginning of the reign of Gordian. It is written in very elegant Greek; and there is an excellent translation of it into Latin, by Angelus Politianus. It was published by Henry Stephens in 4to. in 1581: by Boecler, at Strasburg, in 1662, in 8vo.; and by Hudson, at Oxford, in 1699, 8vo.

in exile, as well as Herodias. Josephus says he

HERODIANS, a sect among the Jews, mentioned in Matt. xxii. 16, and Mark iii. 6. Commentators are much divided with regard to them. St. Jerome, in his dialogue against the Luciferians, takes the name to have been given to such as owned Herod for the Messiah; and Tertullian and Epiphanius are of the same opinion. But the same Jerome, in his Comment on St. Matthew, treats this opinion as ridiculous; and maintains, that the Pharisees gave this appellation by way of ridicule to Herod's soldiers, who paid tribute to the Romans; agreeably to this, the Syrian interpreters render the word by the domestics of Herod, i. e. Herod's courtiers. M. Simon, in his notes on the 22nd chapter of Matthew, advances a more probable opinion. The name he supposes to have been given to such as adhered to Herod's party and interest, and were for preserving the government in his family, about which there were great divisions among the Jews. F. Hardouin will have the Herodians and Sadducees to have been the same. Dr. Prideaux is of opinion that they were distinguished from the other Jews by their concurrence with Herod's scheme, of subjecting himself and his dominions to the Romans, and by complying with many of their heathen usages and customs. This symbolizing with idolatry, upon views of interest and worldly policy, was probably that leaven of Herod against which our Saviour cautioned his disciples. It is farther probable, that they were chiefly of the sect of the Sadducees; because the leaven of Herod is also called the leaven of the Sadducees.

216

HERODIAS. See HERDD. She was granddaughter of Herod the Great, so that even her marriage with her uncle Philip was incestuous, as well as her adultery with her brother.

HERODOTUS, an ancient Greek historian, the son of Lyxus and Dryo, born at Halicarnassus in Caria, in the first year of the seventy-fourth Olympiad, about A. A. C. 484. Halicarnassus being at that time under the tyranny of Lygdamis, grandson of Artemisia, queen of Caria, Herodotus retired to Samos; whence he travelled over Egypt, Greece, Italy, &c., and acquired the knowledge of the history and origin of many nations. He then began to digest the materials he had collected, and composed that history which has preserved his name ever since. He wrote it in the isle of Samos. Lucian informs us, that when Herodotus left Caria to go into Greece, he began to consider with himself,

> The lofty means to be for ever known, And make the ages yet to come his own.

His history, he presumed, would easily procure him fame, and raise his name among the Grecians, in whose favor it was written; but then he saw that it would be tedious to go through all the cities of Greece, and recite it to the inhabitants of each city. He thought it best therefore to take the opportunity of .heir assembling all together; and accordingly recited his work at the Olympic games, which rendered him more famous than even those who had obtained the prizes. None were ignorant of his name, nor was there a single person in Greece who had not either seen him at the Olympic games, or heard those speak of him who had seem him there. His work is divided into nine books; which, according to the computation of Dionysius Halicarnassensis, contain the most remarkable occurrences within a period of 240 years; from the reign of Cyrus to that of Xerxes, when the historian was living. These nine books are named after the nine muses, each book being distinguished by the name of a muse; and this has given birth to two disquisitions : viz. 1. Whether they were so called by Herodo-tus himself; and, 2, For what reason they were so-called. As to the first, it is generally agreed that Herodotus did not impose these names himself; but it is not agreed why they were imposed by others. Lucian tells us, that these names weve given them by the Grecians at the Olympic games, when they were first recited, as the best compliment that could be paid the man who had taken pains to do them so much honor. Others have thought, that the names of the Muses have been fixed upon them by way of reproach, to intimate, that Herodotus, instead of true history, had written a work of fiction. Aldus Manutius, Joachim Camerarius, and Henry Stephens, have written apologies for him; and have very justly observed, that he seldom relates any thing of doubtful credit, without producing the authority on which his narration is founded; and, if he has no certain authority to fix it upon, always uses the terms, ut ferunt, ut ego audivi, &c. There is ascribed also to Herodotus, but falsely, a Life of Homer, which is usually printed at the end of his work. He wrote in the lonic dialect, and his style and manner have been much admired. There have been several editions of his works; two by Henry Stevens, in 1570 and 1592; one by Gale at London in 1679; and one by Gronovus at Leyden in 1715, which is the best.

HEROIC AGE is that age or period of the world wherein the heroes, or those called by the poets the children of the gods, are supposed to have lived. It coincides with the fabulous age.

HEROIC POEM is that which undertakes to describe some extraordinary action, or enterprise. Honer, Virgil, Statius, Lucan, Tasso, Camoens, Milton, and Voltaire, have composed heroic poems. In this sense, heroic poem coincides with epic poem.

HEROIC VERSE is that wherein heroic poems are usually composed; or it is that proper for such poems. In the Greek and Latin, hexameter verses are beculiarly denominated heroic verses, as being alone used by Homer, Virgil, &c. Alexandrine verses, of twelve syllables, were formerly called heroic verses, as being supposed the only verse proper for heroic poetry; but later writers use verses of ten syllables.

HER'ON, n. s. HER'ONRY, n. s. HER'ONSHAW, n. s. fr. heron; Ital. airone; Gr. ερων. A bird that HER'ONSHAW, n. s. feeds on fish; heronry, a place where these birds breed.

He saw when voided were wilde dere, These fauconers upon a faire rivere, That with hir haukes han the heron slain. Chaucer. The Frankeleine's Tale.

The scornyng jaie; the eles foe the heroune, The false lapwing, all full of trecherie.

Chaucer. The Assemblee of Foules.

The heron, when she soareth high, sheweth winds. Bacon.

So lords, with sport of stag and heron full, Sometimes we see small birds from nests do pull. Sidney.

They carry their load to a large heronry above three miles. Derham's Physico-Theology.

HERON, in ornithology. See ARDEA. This bird is a very great devourer of fish, and will do more mischief to a pond than even an otter. People who have kept herons, and have had the curiosity to number out the fish they feed them with into a tub of water, and count them, have found that a heron will eat fifty moderate sized roach and dace in a day. It has been found, that, in carp-ponds visited by this bird, one heron will eat up 1000 store carp in a year, and will hunt them so close that very few can escape. The readiest method of destroying this mischievous bird is by fishing for him in the manner of pike, with a baited hook; the bait consisting of small roach or dace, and the hook fastened to one end of a strong line, made of silk and wire twisted together. The wire should be entered under the gills of the roach, and run just under the skin to the tail; in which condition the fish will live several days; for if it be dead the heron will not touch it. To the other end of the line is fastened a stone of two pounds weight; and, several of these baited lines being sunk by means of the stone in different parts of the pond, in a night or two the heron will certainly be taken.

HEROPHILUS, an ancient physician, born in Chalcedon about A.A.C. 500. He was au accurate anatomist, and is said to have discovered the lacteal vessels, as well as to have

made some discoveries in botany. HERPES, n. s. Gr. $\sharp_{\rho\pi\iota\varsigma}$. A cutaneous imflammation of two kinds: miliaris, or postularis, which is like millet-seed upon the skin; and excedens, which is more corrosive and penetrating, so as to form little ulcers.

A farther progress towards acrimony maketh a herpes; and, if the access of acrimony be very great, it maketh an herpes excedens. Wiseman's Surgery.

HERQUI, or ERQUI, a village of France, in the department of the North Coasts, with a harbour on the British Channel; eighteen miles west of St. Malo, and four and a half E. N. E. of St. Brieux.

HERQUI BAY, and HERQUI POINT, a bay and cape on the coast of the above village. Sir Sidney Smith sailed into this bay on the 17th of March, 1796, and destroyed several French ships.

HERRENBERG, a town of Germany, in Wurtemberg, fourteen miles S.S.E. of Stuttgard.

HERRENBREITUNGEN, a town of Franconia, in Henneberg, on the Werra.

IFERRENGRUND, a mining town of Hungary, four miles N. N.W. of Neusohl. Near it is a productive spring, impregnated with sulphate of copper; the metal is obtained in the form of an oxide by precipitation with iron in the usual way, and is called cement-copper. Here is also a subterraneous passage leading from the town to a place called Stara Hora, or the Old Hill.

HERRERA, a town of Spain, in Old Castile, thirty-two miles N. N.W. of Burgos.

HERRERA (Ferdinand de), an eminent Spanish poet of the sixteenth century, was born at Seville, and principally succeeded in the lyric poetry. Besides his poems, he wrote notes on Garci-lasso de la Vega, and an account of the war of Cyprus, and the battle of Lepanto, &c.

HERRERA TORDESILLAS (Anthony), a Spanish historian, secretary to Vespasian Gonzaga, viceroy of Naples, and afterwards historiographer of the Indies, under Philip II., who allowed him a considerable pension. He wrote a general History of the Indies, in Spanish, from 1492 to 1554; and of the World (not so much esteemed) from 1554 to 1598. He died in 1625, aged about sixty-six.

HERRICK (Robert), a poet of the seventeenth century, was a native of London; and educated at St. John's College, and Trinity Hall, Cambridge. He took orders, and in 1629 was presented to the living of Dean Prior in Devonshire. Under the government of Cromwell he suffered deprivation; but he recovered his benefice after the Restoration, which he did not long survive. His compositions were published in 1648 under the title of Hesperides, or the Works both flumane and Divine of Robert Herrick, 8vo. A selection from them, with an account of the author, by Dr. Nott, was again printed at Bristol in 18t0; and a complete edition at Edinburgh in 1823, 2 vols. 8vo.

HER'RING, n. s. Sax. paping; Teut. hering ; Belg. herink. A small sea fish.

The coast is plentifully stored with round fish, pilchard, herring, mackrel, and cod. Carew. Buy my herring fresh. Swift.

217

HERRING. See CLUPEA. HERRING FISHERY. See FISHERY. HERRING (Thomas), archbishop of Canter-bury, was the son of the Rev. John Herring, rector of Walsoken in Norfolk, where he was born in 1693. He was educated at the free grammar school of Wisbech, and at Jesus College, Cambridge; was afterwards chosen fellow of Corpus Christi College, and continued a tutor there upwards of seven years. Having entered into orders, in 1719, he was successively minister of Great Shelford, Stow cum Qui, and Trinity in Cambridge; chaplain to Dr. Fleetwood, bishop of Ely; rector of Rettingdon in Essex, and of Barly in Hertfordshire; preacher to the Society of Lincoln's Inn, chaplain in ordinary to king George II., rector of Blechingley in Surrey, and dean of Rochester. In 1737 he was consecrated bishop of Bangor, and in 1743 he was made archbishop of York. When the rebellion broke out in 1745, and the king's troops were defeated at Prestonpans, he convened the nobility, gentry, and clergy of his diocese, and addressed them in an animated speech; which had such an effect, that a subscription ensued, to the amount of £40,000; and the example was followed by the nation in general. On the death of Dr. Potter, in 1747, he was translated to the see of Canterbury; but in 1753 was seized with a violent fever, which brought him to the brink of the grave; and, after languishing about four years, he died on the 13th of March, 1757. He expended upwards of £6000 in repairing and adorning the palaces of Croydon and Lambeth. This worthy prelate possessed, in a most eminent degree, the virtues of public life; he was an excellent preacher, and a true friend to religious and civil liberty. After his death was published a volume of his sermons on public occasions.

HERRNHUT, a small town of Saxony, in Upper Lusatia, built by count Zinzendorf in 1722 for the use of the Moravian brethren. Its manufactures consist of cotton and linen stuffs, stockings, sealing-wax, hats, colored paper, ribands, and utensils of copper, brass, and steel. Its observatory and burial-ground on an adjacent hill are worthy attention. Before the crection of this place, the Moravian brethren were scattered throughout the continent. It is nowthe capital of the Moravian establishments, and from it the brethren frequently take the name of Herrnhutters. It is six miles south of Lobau. Inhabitants about 1800.

HERSCHELL (Sir William), LL.D., the distinguished astronomer, was son of a musician of Hanover, born November 15th, 1738. He was destined by his father for his own profession, and placed at the age of fourteen in the band of the Hanoverian guards. Quitting this regiment abruptly, he arrived in England in 1757; and obtained the patronage of the earl of Darlington. He also succeeded in conducting several concerts, oratorios, &c., in the palatinate of Durham, and the neighbourhood. In 1766 he became organist at Halifax; then at the

Octagon chapel, Bath, which, together with his pupils, produced him a good income. He had now for some time devoted his leisure hours to the mathematics and astronomy; and set about constructing a telescope for himself: he soon produced a seven, a ten, and a twenty feet reflector, having in the latter case used nearly 200 object mirrors before he could satisfy himself. From this period he gradually withdrew from his musical engagements. Late in 1779 he began a survey of the heavens with a seven feet reflector, and after eighteen months' labor, discovered, on the 13th of March, 1781, a new planet, which he named the Georgium Sidus. This drew upon him the public attention, and the patronage of his late majesty; who, by the settlement of a handsome salary, enabled him to devote the rest of his life to astronomy, at Datchett, near Windsor, and at Slough ; where he commenced the erection of his forty feet telescope, and completed it in 1787. In 1783 he discovered a volcanic mountain in the moon, and from farther observations, with the assistance of his instrument, in 1787, two others were plainly distinguished, emitting fire from their summits; he also ascertained that the Georgium Sidus was surrounded with rings, and had six satellites, &c. In 1802 Herschell laid before the Royal Society a catalogue of 5000 new nebulæ, nebulous stars, planetary nebulæ, and clusters of stars, which he had discovered; and received from the university of Oxford the honorary degree of doctor of laws, which was followed up, in 1816, by the Guelphic order of knighthood from the regent. He continued his astronomical observations till within a short period of his death, which took place at Slough in August, 1822.

HERSCHELL, the name given by some foreigners to the new planet, called Georgium Sidus hy Dr. Herschell, who discovered it. See As-TRONOMY.

HERSE, n. s. & v. a.) See HEARSE. A § temporary monument HERSE'LIKE, adj. raised over a grave; the carriage in which corpses are drawn at a funeral : herselike, funereal ; suitable to funerals ; dull ; dismal.

And, after that, about the herses

Full many orisons and verses,

Withouten note, ful softely

Said were; and that full hertily

That all the night, till it was day,

The peple in the church con pray.

Chaucer's Dreame.

I would my daughter were dead at my foot, and the jewels in her ear. O, would she were hersed at my foot, and the ducats in her coffin.

Shakspeare.

Even in the Old Testament, if you listen to David's harp, you shall hear as many herselike airs as carols. Bacon.

The Grecians spitefully drew from the darts the corse,

And hersed it, bearing it to flect. Chapman. The house is hersed about with a black wood, Which nods with many a heavy-headed tree.

Crashaw. When mourning nymphs attend their Daphuis' herse,

Who does not weep that reads the moving verse? Roseummon.

On all the line a sudden vengeance waits, And frequent herses shall besiege your gates

Pope.

HERSE. Fr. herce, i. e. a harrow. In fortification, a lattice, or portcullis, in form of a harrow, beset with iron spikes. It is usually hung by a rope fastened to a manlinet; to be cut, in case of surprise, or when the first gate is broken with a petard, that the herse may fall, and stop up the passage of the gate or other entrance of a fortress. It is otherwise called a sarrasin, or cataract; and when it consists of straight stakes, without any cross pieces, it is called orgues.

HERSE is also a harrow which the beseiged, for want of chevaux de frise, lay in the way, or in breaches, with the points up, to incommode

the march of the enemy's horse or infantry. HERSELF', pron. See HER. A female individual as distinguished from others; mistress of her own thoughts; the oblique case of the reciprocal pronoun.

The daughter of Pharaoh came down to wash her-Exodus. self. Judges.

She returned answer to herself.

Not that I may encresen hire honour,

For she hireselven, is honour and rote Of bountce, next hire sone ; and soules bote. Chaucer. The Prioresses Tale.

The jealous o'er-worn widow and herself,

Since that our brother dubb'd them gentlewomen, Are mighty gossips in this monarchy. Shakspeare.

And while vain pomp does her restrain

Within her solitary bower,

She courts herself in amorous vein,

Herself both Danze and the shower. Marvell.

The more she looks, the more her fears increase, At nearer sight; and she's herself the less.

Dryden.

HERSENT (Charles), a French divine of the seventeenth century, who wrote a work entitled Optati Galli de cavendo Schismate. As in this work he charged Cardinal Richelieu with views inimical to the Gallican church, he was obliged to quit France, and retire to Rome; where he incurred censure from the Inquisition, by publishing some peculiar opinions on the doctrine of grace, and was excommunicated. He then returned to France; wrote a Paraphrase on Solomon's Song, with other tracts; and died in 1660.

HERSILIA, the wife of Romulus, the first king of Rome. After her death she was deified, and worshipped under the names of Horta and Orta.

HERSILLON, in the military art, a sort of plank or beam, ten or twelve feet long, whose two sides are driven full of spikes or nails to incommode the march of the infantry or cavalry. The word is a diminutive of herse.

HERTFORD, or HARTFORD, the county town of Hertfordshire, and a borough sending two members to parliament, stands on the river Lea, twenty-one miles north of London. Its British name appears to have been Durocobriva, or the Red-Ford, from the color of the gravel at the bottom of the river: others derive it from hart a decr, there formerly having been great numbers here. It has also been written Hereford. See the county. The arms of the town

are a hart couchant in the water; but they are probably derived from the name of the town. Alfred erected a castle here to check the depredations of the Danes, who came by water from the Thames to Ware; and several Saxon monarchs held courts here. There are in Hertford two parish churches, All Saints' and St. Andrew's. The governors of Christ's Hospital, in London, have a gallery in the latter for the accommodation of the children of their school here, which contains about 400 boys and sixty girls. Here are three dissenters' meeting-houses, a well-established Sunday-school, and a public charity-school for boys and girls. The county gaol and penitentiary-house is a new and commodious building. The town has had several charters of incorporation, but is now governed by a mayor, a high-steward (who is generally a nobleman), a recorder, nine aldermen, a town clerk, a chamberlain, ten capital burgesses, sixteen assistants, and two sergeants at mace. The county election is held here in the shire-hall, a noble building erected by Mr. Adam, in 1780. The electors of the borough consist of householders, and such freemen as were inhabitants when made free. The number of voters exceeds 620. In the reign of William I. a priory of Benedictine monks was founded here, under the abbey of St. Alban's: the remains of its castle consist at present of a gate-house, and an ancient wall with angular towers. The market on Saturday is well supplied with grain. Fairs, second Saturday before Easter-Sunday, Old May-day, Old Midsummer-day, and November 8th, all for cattle.

HERTFORD COLLEGE, is an important establishment of the East India Company at Hertford. The establishment of this college arose out of a project of the marquis of Wellesley; who, during his administration in India, founded at Calcutta a collegiate institution, to provide the means of acquiring a knowledge of the languages, the laws, and the local usages of our Indian empire. The directors of the East India Company disapproved in part of the plans of the governor-general; but they at the same time felt the necessity of giving some knowledge to those whom they had nominated as writers : the result was the establishment of the Hertford College.

The system of instruction here adopted holds a medium between the strictness of our public schools and the laxity of the English universities. Every youth, upon being nominated by a director, must, previous to his admission, produce a testimonial from his schoolmaster, and pass an examination in Greek, Latin, and arithmetic, before the professors: those who are found deficient are remanded till another period; for the lectures of the different professors in the college are given in a manner to make preparation necessary, and to encourage most effectually habits of future application. They embrace, in substance, all the important parts of classical literature, the oriental languages, the elements of mathematics and natural philosophy, the laws of England, general history, and political economy.

Examinations take place twice a year, which

continue twelve days; and are conducted upon the general plan of the collegiate examinations of our universities, particularly of Cambridge, The questions are framed with a view to ascertain the degree of progress and actual proficiency in each particular department on the subjects studied during the term ; and the answers, in all practicable cases, are given in writing, in the presence of the professors, and without reference to books. After the examination is over. the professor of each department reviews, at his leisure, the papers he has received, and places, as nearly as he can, each individual in the numerical order of his relative merit, and in certain divisions implying his degree of positive nierit. These arrangements are finally subject to the control of the whole collegiate body. Besides these classifications, prize-medals, books, and honorary distinctions, are awarded to those who are the heads of classes, or as high as second, third, fourth, or fifth, in two, three, four, or five, departments. The course of study occupies two years, and is designed to commence at such an age, that the student may be ready to proceed to India by the time he is eighteen or nineteen years old: having thus begun the study of the oriental languages, he is prepared to prosecute them with advantage at Calcutta, so as to proceed to any official appointment on arriving at his majority.

Each pupil, of whom there are eighty, pays £100 per annum to the college; which is not thought to cost the company more than £10,000 a year. Among its professors this college has already ranked the distinguished names of Sir James Mackintosh and Mr. Malthus.

HERTFORDSHIRE, a county of England, which, as well as those of Bedford and Bucks, belonged to the Cassii, or Catieuchlani, terms signifying men in hostility, or of battle; the latter particularly meaning warriors of the coverts. After the Romans had obtained possession of the island, it was included in the province or district called Flavia Cæsariensis. During the Saxon usurpation it was unequally divided between the kingdom of the East Saxons and that of Mercia .- The name of Hertford, the county town, seems to be derived from much the same source as that of the county just described. It was also written Hereford by the Saxon authors, which is thought to be a corruption of Here Ford, i. e. the Army's Ford.

This is an inland county, situated between the parallels of 51° 37' and 52° 5' N. lat. It is bounded on the north and west by Bedfordshire and Cambridgeshire, by Buckinghamshire on the west, by Essex on the east, and by Middlesex on the south. 'It measures,' says Mr. Young, 'twenty-eight miles from cast to west, thirty-six miles from north to south, and 130 miles in circumference.' It contains eight hundreds, nineteen market-towns, 120 parishes, and 949 villages. It is in the dioceses of London and Lincoln, the province of Canterbury, and is included in the home circuit.

Of the climate of this county Mr. Young writes, 'I met with no registers of the weather; nor would they probably have contained any thing reaterially different from other counties equally southern. The harvest is not forwarder here than in Cambridgeshire; and in the thickest woodland parts, where the soil is wet, it is not so forward as in the more open parts of that adjacent county.' The air, however, is deemed generally mild and healthy. The surface is in nany parts richly diversified with hill and dale, clothed with noble woods, and thickly studded with numberless parks attached to the seats of the nobility and gentry.

The soils, as delineated on Mr. Young's map, are of the following character: Much the largest portion, occupying all the western border, and extending diagonally beyond the middle of the county, as far as Wotton-Wood Hall, and also round Hertford, is loam of different qualities. The next portion is clay, occupying two districts ; the smallest of which is the southern, a stiff, harsh, and tenacious soil; the other, which is much the largest, is the north-east district, consisting of rather a strong wet loam, on a stiff basis of clay-marl. The chalky district extends along a great part of the north-west borders, south-west and due east of Baldock the eastern extremity. But chalk forms the basis, at different depths, of the whole county. The surface chalk consists of two variations :--- chalk with no other mixture than what ages of cultivation and manuring have added, and what is called marm, which is a white marl, from a mixture of a portion of clay. Both these soils are good, but the latter is the best. The fourth, or last district, is denominated ' poor gravel.' It is a small triangular patch, having the town of Hatfield nearly in the centre of its base. Besides these, there is a small slip of rich loam extending along the borders of the county, between Theobald's and Hoddesdon. But all these soils are extremely varied and intermixed.

The principal rivers are the Lea and the Colne, and these two are composed of many inferior streams, most of whose sources lie in this county. The Lea rises near Lea-Grove Bedfordshire, enters Herts near Bower Heath, and, traversing the county in a north-westerly direction, joins the Stort about a mile east of Hoddesdon, then runs nearly south, and continues with that river, for the most part, the boundary of the county towards the east. The Colne, being the same river that is called Verulam, Verlam, or Muse River, rises in the hundred of Dacorum, near Marget Street, and the confines of Bedfordshire. It runs S.S.E. to St. Alban's, and by the walls of the Roman Verulam; thence nearly south till it loses its original name of Verulam and its consequence, near Colney Street, in the river Colne, which is there a small stream, and rises near Kit's End in Middlesex. Besides these, there are several smaller streams, particularly the Maren, the Beane, the Rib, the Quin, the Ash, and the Gade. The Nine-Sister Spring of the celebrated Cam at Ashmead, the source of the Ilix near Ilitchin, and the sources of other rivers are in this county.-The Grand Junction Canal, from Braunston Wharf on the Coventry Canal to Old Brentford, where it joins the Thames, enters the county of Hertford above Berkhamstead, and follows the course of the Bulbum 'and Gade to Rickmansworth; and

thence the course of the Colne, till it leaves the county.—The few medicinal springs of this province are chiefly chalybeate; these are confined to the south part. Some incrustating springs have been noticed near Colthall, in the northern part of the county.—The agricultural produce consists principally of wheat, barley, and apples: there are no minerals of any consequence.

Hertfordshire sends six members to parliament: viz. two for the county, two for Hertford, two for St. Alban's.

Hertfordshire has produced the following celebrated characters: viz. St. Alban, the protomartyr of England, born at Verulam, now St. Alban's, in the third century. He suffered during the Dioclesian persecution, A. D. 303 .-John Shute, lord viscount Barrington, a learned and pious nobleman and theological writer, was born at Theobalds, 1678. Died 1734 .-- Nicholas Brekespeare, Pope Adrian IV., the only Englishman who ever attained that dignity, was born at Langley near St. Alban's; he died, not without suspicion of poison, in 1159.-The pious and amiable poet Cowper, was born at Berkhamstead, 1741; died April 25th, 1800.—Richard Cromwell, eldest son of Oliver, was born at Cheshunt, 1626; died 1712.—Sir Richard Fanshawe, a statesman and poet, born at Ware, 1607; died 1666 .- Robert Hill, a remarkable self-taught linguist; born at Tring, 1699; died 1777 .- Sir John King, an eminent lawyer, born at St. Alban's, 1639; died about 1677 .- Sir John Mandeville, a remarkable traveller, born at St. Alban's; died at Liege, 1371 .- Thomas Stanley, a learned poet and historian, born in this county, in 1644; died 1678 .- John Walker, the worthy author of the Pronouncing Dictionary, and several other valuable works, born at Barnet, 1732; died 1807 .- Seth Ward, a learned divine and mathematician born at Buntingford, 1617; died in a state of insanity, 1689. Hertford, the county town, gives the title of marquis to the Seymour-Conway family. This county may be said in general to be destitute of manufactures ; yet not entirely so. Plaiting straw, is a resource for poor women and children in one part of the county, and is carried on to a great extent in and near Dunstable, and at Redbourne, St. Alban's, Berkhamstead, Hitchin, &c .- Malt is also made to a considerable extent.

HERTHA, or HERTUS, in mythology, a goddess worshipped by the ancient Germans. She is mentioned by Tacitus, in his book De Moribus Germanorum, cap 40. Vossius supposes that this goddess was Cyhele : but she was more properly Terra or the Earth ; for the Germans still use hert for the earth, whence also the English word earth.

IIERVEY (James), a clergyman of exemplary piety, was born in 1714, and succeeded his father in the livings of Weston-Favell, and Collingtree, in Northamptonshire. These, being within five miles of each other, he attended alternately with his curate; till, being confined by ill health, he resided constantly at Weston; where he diligently pursued the labors of the ministry and his studies. This excellent divine died on Christmas day 1758, leaving the little he possessed to buy warm clothing for the poor in that severe season. No work is more generally or deservedly known than his Meditations and Contemplations: containing Meditations among the Tombs, Reflections on a Flower-garden, a Descant on Creation, Contemplations on the Night and Starry Heavens, and a Winter Piece. The sublime sentiments in these pieces have the peculiar advantage of being conveyed in a a flowing elegant language, and they have accordingly gone through many editions. He published, besides, Remarks on lord Bolingbroke's Letters on History; Theron and Aspasio, or a Series of Dialogues and Letters on the most Important Subjects; some sermons and other tracts.

HERY, v. a. Sax. benian, to praise; to celebrate. To hallow; to regard as holy. Now no longer in use.

And whan that folk it to his fader told, Not only he, but all his contree mery Was for this childe, and God they thanke and *hery*.

Chaucer. The Clerkes Tale.

But by the mouth of children thy bountee, Parfourmed is, for on the brest sinking

Sometime shewen they thin herying.

Chauser. The Prioresses Tale. Then wouldst thou learn to carol of love,

And hery with hymns thy lasse's glove.

Spenser.

HESBON, ESEBON, or HESHBON, in ancient geography, the royal city of the Amorites, in the tribe of Reuben, according to Moses; though in Josh. xxi. 39, where it is reckoned among the Levitical cities, it is put in the tribe of Gad; which proves its situation to be on the confines of both.

HESDIN, a well built and fortified town in the department of the Pas-de-Calais, France, situated among the marshes of the small river Canche. Including the four suburbs contiguous, Hesdin contains about 5000 inhabitants, chiefly employed in the manufacture of stockings, caps, &c. It is twelve miles south-east of Montreuil, and twenty-seven west of Arras.

HESELRIGE (Sir Arthur), Bart., was the eldest son of Sir Thomas Heselrige, of Nosely, in Leicestershire, a gentleman of an ancient family, and succeeded to the title on the death of his father, in 1629. He was one of the representatives in parliament for the county of Leicester in 1640, when he distinguished himself by his opposition to the arbitrary measures of the court; and was active in procuring a bill of attainder against lord Stafford. His name appears among the members of parliament, whose arrest was the object of Charles I.'s visit to the house of commons. In the civil wars, Sir Arthur Heselrige was governor of Newcastle; and commanded a regiment of cuirassiers, which he had raised. He also acted at the head of a committee at Leicester, for the confiscation of the property of the royalists. He particularly attached himself to Cromwell, whose confidence he enjoyed; and, after the death of the king, was appointed one of the council of state. The protector likewise nominated him a member of his house of peers. At the beginning of the Restoration, he endeavoured to counteract the designs of Monk; and did not live to witness the triumph of the royal cause, his death having

taken place January the 7th, 1660. Two letters which he wrote on military service have been published; 1. Concerning the revolt and recovery of Tinemouth Castle; London, 1648, 4to.; and 2. A Letter to William Lenthall, concerning a great victory obtained by the Parliament Forces in Northumberland, London, 1648, folio.

HESHUSIUS (Tilleman), a German Lutheran divine, born at Wessel in 1526. He wrote, 1. Commentaries on the Psalms: 2. On Isaiah: 3. On St. Paul's Epistles; and, 4, On Justification and the Lord's Supper. He died in 1588.

HESIOD, a very ancient Greek poet; but whether contemporary with Homer, or a little older, is not agreed among the learned. His father, as he tells us in his Opera et Dies, was an inhabitant of Cumæ, one of the Æolian Isles, now called Taio Nova; and removed thence to Ascra, a little village of Bœotia, at the foot of Mount Helicon, where Hesiod was probably born. Of what rank his father was is no where said ; but that he was driven by misfortunes from Cumæ to Ascra, Hesiod himself informs us. His father seems to have prospered better at Ascra, than he did in his own country; yet Hesiod could arrive at no higher fortune than keeping sheep on the top of Mount Helicon. Here he first devoted himself to the service of the Muses, as he boasts in his Generatio Deorum :-

Erewhile as yet the shepherd swain behold, Feeding beneath the sacred mount his fold, With love of charming song, his breast they fired : There me the heavnenly muses first inspired ; There, when the maids of Jove the silence broke, To Hesiod thus the shepherd swain they speke, &c.

On the death of the father, an estate was left, which ought to have been equally divided between Hesiod and his brother Perses; but Perses defrauded him in the division, by corrupting the judges. The last circumstance he mentions relating to himself is his conquest in a poetical contention.' Archidamus, king of Eubœa, had instituted funeral games in honor of his own memory, which his sons afterwards took care to have performed. Here Hesiod was a competitor for the prize in poetry; and won a tripod, which he consecrated to the Muses. When he was grown old (for it is agreed by all that he lived to a very great age), he removed to Locris, a town about the same distance from mount Parnassus as Ascra was from Helicon. His death was tragical. The man with whom he lived at Locris, a Milesian born, ravished a maid in the same house; and though Hesiod was entirely ignorant of the fact, yet, being maliciously accused to her brothers as an accomplice, he was unjustly slain with the ravisher, and thrown into the sea. The Theogony and Opera et Dies are the only undoubted pieces of this poet now extant; but it is supposed that even these have not come down to us complete. A good edition of Hesiod's works was published by Le Clerc, at Amsterdam, in 1701.

ITESIONE, in fabulous history, the daughter of Laomedon, king of Troy, and sister of king Priam. Being exposed to be devoured by a sea-monster, Hercules killed it and delivered HES

elamon. HES'ITANCY, n. s. HES'ITATE, v. a. HESITA'TION, n. s. Goubt, suspense : he-

sitate, to faulter, demur, pause : besitation, intermission of speech; difficult utterance; suspense; delay.

The reason of my hesitancy about the air is, that I forgot to try whether that liquor, which shot into crystals, exposed to the air would not have done the like in a vessel accurately stopped. Boyle.

I cannot foresee the difficulties and *hesitations* of every one: they will be more or fewer, according to the capacity of each peruser.

Woodward. Natural History, Some of them reasoned without doubt or hesitancy, and lived and died in such a manner as to show that they believed their own reasonings. Atterbury.

A spirit of revenge makes him curse the Grecians in the seventh book, when they hesitate to accept Hector's challenge. Pope.

Willing to wound, and yet afraid to strike

Just hint a fault, and hesitate dislike;

Alike reserved to blame or to commend,

A tim'rous foe, and a suspicious friend. Pope.

Many clergymen write in so diminutive a manner, with such frequent blots and interlineations, that they are hardy able to go on without perpetual hesitations. Swift.

HESPER, HESPERUS, Gr. $\delta\sigma\pi\epsilon\rho\sigma_{c}$, in astronomy, the evening star; an appellation given to Venus when she sets after the sun. See Hesperus.

HESPERIA, or HESPERIA MAGNA, an ancient name of Italy; so called by the Greeks from its western situation.

HESPERI CORNU is called the Great Bay by the author of Hanno's Periplus; but most interpreters, following Mela, understand a promontory; some Cape Verd, others Palmas Cape: Vossius takes it to be the former, since Hanno did not proceed so far as the latter cape.

HESPERIDEÆ, in botany, from the Hesperides; golden or precious fruit: the nineteenth order in Linnæus's natural method. See Bo-TANY.

HESPERIDES, in ancient mythology, the granddaughters of Hesperus, the brother of Atlas. According to Diodorus, these brothers possessed great riches in the western parts of Africa. Hesperus had a daughter called Hesperia, who married her uncle Atlas, and from this marriage proceeded seven daughters, called Hesperides from the name of their mother, and Atlantides from that of their father. According to the poets, the Hesperides were three in number, Ægle, Arethusa, and Hesperethusa. Hesiod, in his Theogony, makes them the daughters of Nox, Night, and seats them in the same place with the Gorgons; viz. at the extremities of the west, near mount Atlas; because the sun sets there. They were fabled to have had the keeping of certain golden apples, on the other side of the ocean. A dragon watched the garden, but Hercules slew him, and carried off the apples. Pliny and Solinus suppose the dragon to mean an arm of the sea, wherewith the garden was encompassed, and which defended

the entrance; and Varro supposes, that the golden apples were sheep. Others, with more probability, say they were oranges.

HESPERIDES, GARDENS OF THE, in ancient geography, are placed by some authors at Larach, a city of Fez; by others at Bernich, a city of Barca, which accords better with the fable. Others take the province of Susa in Morocco for the island wherein the garden was seated. And, lastly, Rudbecks places the Fortunate Islands, and these gardens, in his own country, Sweden.

HESPERIDUM INSULE, in ancient geography, islands near the Hesperi Cornu; but the accounts of them are so much involved in fable, that nothing certain ean be affirmed of them.

HESPERIS, ROCKET, dame's violet, or queen's gilliflower; a genus of the siliquosa order, and tetradynamia class of plants; natural order thirty-ninth, siliquosæ. The petals are turned obliquely; there is a glandule within the shorter stamina; the siliqua almost upright; the stigma forked at the base, conuivent, or closing at the top: call close. The species are,

1. H. inodora, the scentless rocket, with a fibrous root; upright, round, firm stalks, two feet high, garnished with spear-shaped, acute, pointed, sharply indented, close-sitting leaves; and all the branches terminated by large spikes of scentless flowers, with obtuse petals, of different colors and properties in the varieties. This species makes a fine appearance, but has no scent.

2. II. matronalis, the common sweet-scented garden rocket, having fibrous roots, crowned with a tuft of long, spear-shaped, rough, leaves; upright, single, hairy stalks, two feet high ; garnished with oval, lanceolate, slightly indented, close-sitting leaves; and the stalk and branches terminated by large and long spikes of sweetscented flowers of different colors and properties in the varieties, of which there are a great number. All the varieties of this species are so remarkable for imparting a fragrant odor, that the ladies were fond of having them in their apartments. Hence they derived the name of dame's violet; and, bearing some resemblance to a stock gilliflower, were sometimes also called queen's gilliflower; but are now most commonly called rocket.

3. H. tristis, the dull-flowered night-smelling rocket, has fibrous roots, upright, branching, spreading, bristly stalks, two feet high; spearshaped pointed leaves; and spikes of pale purple flowers, of great fragrance in the evening. All the species are hardy, especially the first and second, which prosper in any of the open borders, and any common garden soil; but the third should have a dry warm situation, and a few may be placed in pots to be sheltered in case of inclement weather. They may be propagated either by seeds, by offsetts, or by cuttings off the stalks.

HESPERUS, in mythology, the brother of Atlas, and grandfather of the Hesperides. Diodorus, lib. iii. relates, that Hesperus, having ascended to the top of Mount Atlas, the better to observe the stars, never returned; and hence he was fabled to have been changed into the star called Lucifer in the morning, and Hesperus in

the evening. HESSE CASSEL, an electorate of Western Germany, bordering on Hanover, the Prussian States, Hesse Darmstadt, and Nassau. In 1803 the former title of Landgrave was first exchanged by the nouse of Hesse for that of elector, through the influence of Napoleon: but, the reigning prince not being sufficiently subservient to France, his territories were afterwards added to the kingdom of Westphalia: and the elector retired to Prague. One of the first effects of the

victories of the allies, in 1813, was the re-establishment of this prince. He holds the eighth place in the German States, and has three votes in the grand assembly of the diet.

His dominions consist, according to the final settlements of the congress of Vienna, of Upper and Lower Hesse, the grand duchy of Fulda, the territory of Hanau, and the lordship of Schmalkalden, with some smaller adjacent territories. They are divided into ten provinces, thus described :---

	Provinces	•		Containing in English Sq. miles.	Population.	Chief Towns	Inhabitants.
11	. Lower Hesse			1883	248,000	Cassel	19,500
12	. Upper Hesse			651	58,319	Marburg	6500
	. Hersfeld			159	19,010	Hersfeld	5222
14	. Ziegenhain .			223	26,600	Ziegenhain	1100
1.5	. Fritzlar			136	16,102	Fritzlar	2267
16	. Schmalkalden			117	22,826	Schmalkalden	4697
17	. Fulda			618	68,006	Fulda	7463
8	. Isenburg			95	47,457	Birstein	1000
19	. Hanau			427	63,000	Hanau	11,997
10	. Schauenburg			194	27,000	Rintelen	2666

Much of the surface of these provinces is occupied with hills abounding with wood and minerals; and interspersed with valleys devoted to pasturage. Upper Hesse is partly occupied by the lofty range of Wesergebirge. The elevated parts of Fulda are Vogelsberg and Rhoen; and Schmalkalden is principally occupied by the forest of Thuringia. The climate, on the whole, is cold and uncongenial in comparison with the latitude. Hanau produces the most useful vegetables; its soil is rich, and its climate comparatively mild. It is the only district in which the vine flourishes. But agriculture is altogether in a backward state.

The chief rivers of Hesse Cassel are the Maine, the Fulda, the Werra, the Edder, and the Lahn. Tobacco is grown along the banks of the Werra and the Maine; but potatoes supply a great part of the population with food. Flax is raised in some places, and is a valuable article for domestic purposes. The mountainous districts afford large supplies of timber; and many useful metallic productions. Among these are silver, copper, iron, cobalt, vitriol, salt, alum, marble, basalt, and coal. Cassel, the capital of the electorate, is situated on the Fulda, in the district of Lower Hesse. Other chief places are Hanau, Marburg, and Fulda. Linen, made from the flax grown in the country, is the staple manufacture; besides supplying the home consumption, the linen and yarn annually exported amount to about £300,000. Much of the native iron and steel is wrought upon the spot in Schmalkalden. The silk manufacture is carried on in a few places; and cotton spinning has been lately introduced. The commerce of Hesse Cassel languishes for want of free channels. Its principal streams, the Maine and the Werser, traverse only corners of its territory, and heavy

duties are levied on the navigation of others, by the states through which they pass to the sea.

Education is restricted to the higher ranks by law; and the press is greatly restrained here. The constitution is a limited hereditary monarchy: the states, consisting of the prelates, and nobles, deputies from the towns.

The reigning family and most of the inhabitants are Calvinists; they amount to about 340,000. The Lutherans are stated at 150,000; the Catholics at about 90,000, and the Jews at Smaller sects make up the remainder 8500. of the population. The contingent to the confederate army is 5400 men, but the whole of the armed force amounts to 8000 or 10,000, and the revenue to about 500,000. A public debt has lately been incurred, equal to about one year's revenue.

HESSE DARMSTADT, OF the GRAND DUCHY OF HESSE, is situated near the Rhine, and belongs to another branch of the House of Hesse. It is divided into two parts, by the country of Hanau and the territory belonging to Frankfort, which stretches along the right bank of the Maine. The southern portion of these dominions, which is the most fertile, contains an area of 2000 square miles, and a population of 350,000. The other division contains about 1900 square miles, and a population of 250,000. The territorial extent of the whole grand duchy, including its possessions on the left bank of the Rhine, has been lately stated by M. Pauli to include only 3617 square miles, and 620,630 inhabitants, which is about 171 persons to each square mile.

None of the minor states of Germany have benefited by the French Revolution more than this. The landgrave became an early member of the confederation of the Rhine, and, with the title of grand duke, received considerable accessions of territory, with the sovereignty of the free cities within his dominions. In 1809 he obtained further accessions, in consequence of his exertions against Austria; and when, after the battle of Leipsic, he agreed to join the allies, it was on condition of preserving his territory entire. The congress of Vienna, in 1815, confirmed this treaty; and in the cessions made to Hesse Darmstadt on the left bank of the Rhine, in return for what was relinquished on the right, to suit other members of the alliance, the balance was in favor of the grand duke, both as to population and compactness of territory.

Hesse Darmstadt is fully as mountainous as Hesse Cassel, its northern division containing part of the ranges of the Vogelsberg and Wersterwald; while the southern has on the right of the Rhine the rugged and romantic Odenwald, and on the left a number of hills and mountains, branching off from Mont Tonnerre. Its metallic products of iron, copper, and lead, supply the chief articles of commerce; but the soil is often poor, and in many districts the lower orders live chiefly on potatoes: in the valleys corn and vegetables are successfully cultivated; also flax; and in certain situations tobacco; vines only appearing along the banks of the Maine and Rhine. The pasturage in general is good; and salt is obtained in large quantities at Creutznac. The rivers, besides the Rhine and Maine, are the Lahn, the Nidda, the Ohen, the Schwalm, and the Itter, all to the north of the Maine. The climate is healthy, and the position of the coun-try favorable to trade; but this advantage has been little improved. The principal manufactures, which are also in a drooping state, are linen, woollen, leather, and hardware. Its chief towns are, Mentz, population 25,000; Darmstadt (the capital) 12,000; Worms, 5700; Giessen 2500. The town of Darmstadt has of late increased rapidly, principally from a twenty years' exemption from taxes, granted here to whoever builds a house in conformity with the government plan.

The constitution of Hesse Darmstadt is a limited monarchy, divided into states or representatives; but the latter are not often assembled. The crown is hereditary in the male line, and the sovereign is considered of age at eighteen. Hesse Darmstadt has one vote and the ninth place at the smaller assembly of the Germanic diet; at the larger it has three votes. Besides the ministry, the high court of appeal, and other offices at Darmstadt, each province has a regency, a court of justice, a chamber of finance, and a commission for the domain lands. The minor divisions of the grand duchy are bailiwics. The revenue is calculated at £400,000, of which £80,000 go to pay the interest of the national debt. The military are between 6000 and 7000 men, besides militia. In point of education Hesse Darmstadt has of late made considerable advances. There is a university at Giessen; at Mentz a school of law; and classical schools at Giessen, Darmstadt, Mentz, and Worms.

HESSE-HOMBURG, a small principality to the south of Hesse-Darmstadt at the foot of the Tauuus Mountains, and belonging, with the title of

224

landgrave, to a younger branch of the family o Hesse-Darmstadt. It formerly had only about 7000 inhabitants; but the influence at the congress of Vienna of four sons of the reigning prince who acted a distinguished part in the late wars of Austria, obtained it several additional districts, and it now reckons 20,000 inhabitants. In 1806. when the confederation of the Rhine was formed, the landgrave was deprived of his states. Its new territories are on the left side of the Rhine. The landgrave is an independent member of the Germanic confederation; but his revenue hardly exceeds £18,000 a-year. The family residence is at the town of Homburg, containing about 3500 inhabitants, and situated in a beautiful country, at the foot of lofty mountains. It is called, on that account, Homburg on the Height. The eldest of the sous, the hereditary prince, married the princess Elizabeth of England in 1818: another of the brothers is married to a princess of Prussia. The professed religion here is Calvinism.

HESSIAN FLY, a very mischievous insect, which a few years ago appeared in North America; and whose depredations then threatened entirely to destroy the crops of wheat in that country. It is, in its perfect state, a small winged insect; but the mischief it does is while in the form of a caterpillar; and the difficulty of destroying it is increased by its being as yet unknown where it deposits its eggs, to be hatched before the first appearance of the caterpillars. These mischievous insects begin their depredations in autumn, as soon as the wheat begins to shoot up through the ground. They devour the tender leaf and stem with great voracity, and continue to do so till stopped by the frost; but no sooner is this obstacle removed by the warmth of the spring, than the fly appears again, laying its eggs now upon the stems of the wheat just beginning to spire. The caterpillars, hatched from these eggs, perforate the stems of the remaining plants at the joints, and lodge themselves in the hollow within the corn, which shows no sign of disease till the ears begin to turn heavy. The stems then break; and, being no longer able to perform their office in supporting and supplying the ears with nourishment, the corn perishes about the time that it goes into a milky state. These insects attack also rye, barley, and timothy grass, though they seem to prefer wheat. This terrible insect appeared first in Long Island during the American war, and was supposed to have been brought from Germany by the Hessians; whence its name. Thence it proceeded inland at the rate of about fifteen or twenty miles annually; and in 1789 had reached 200 miles from the place where it was first observed. At that time it continued to proceed with unabating increase; being apparently stopped neither by rivers nor mountains. In the fly state it is likewise exceedingly troublesome; by getting into houses in swarms, falling into victuals and drink; filling the windows, and flying perpetually into the candles. It still continued to infest Long Island as much as ever; and in many places the culture of wheat was entirely abandoned. Mr. Morgan, in a communication to the Philadelphia Society for promoting

agriculture, informs us, that he had made himself acquainted with the fly, by breeding a number of them from the chrysalis into the perfect state. The fly is at first of a white body with long black legs and whiskers, so small and motionless as not to be easily perceived by the naked eye, though very discernible with a mi-croscope; but they soon become black and very nimble, both on the wing and feet, being about the size of a small ant. During the height of the brood in June, where fifty or 100 of the nits have been deposited on one stalk of wheat, he has sometimes discovered, even with the naked eye, some of them twist and move on being disturbed: this is while they are white; but they do not then travel from one stalk to another, nor to different parts of the same stalk. The usual time of their spring hatching from the chrysalis is in May. 'Those who are doubtful whether the fly is in their neighbourhood, or cannot find their eggs or nits in the wheat, may satisfy themselves by opening their windows at night, and burning a candle in the room. The flies will enter in proportion to their numbers abroad. The first night after the commencement of wheat harvest, this season, they filled my dining room in such numbers as to be exceedingly troublesome in the eating and drinking vessels. Without exaggeration I may say, that a glass tumbler, from which beer had been just drunk at dinner, had 500 flies in it in a few minutes. The windows are filled with them when they desire to make their escape. They are very distinguishable from every other fly by their horns or whiskers.' In its perfect state it is probably a tenthredo, like the black negro fly of the turnip. As great quantities of wheat were at this time imported from America into Britain, it became an object worthy of the attention of government, to consider how far it was proper to allow of such importation, lest this destructive insect might be brought along with the grain. See our article ENTOMOLOGY.

HEST, n. s. Sax. pært. Command; precept; injunction. Obsolete, or written behest.

When faith fayleth in priestes sawes, And tordes *hestes* are holden for lawes, And robberie is holde purchase, And lecherie is holde solace; Then shall the lord of Albion Be brought to great confusion. *Chaucer's Prophecie.*

Thou wast a spirit too delicate

To act her carthy and abhorred commands,

Refusing her grand hests. Shakspeare.

HESYCHIUS, the most celebrated of all the ancient Greek grammarians, whose works are extant. He was a Christian; and, according to some, the same with Hesychius, patriarch of Jerusalem, who died in 609. He wrote a Greek lexicon; which, in the opinion of Casaubon, is the most learned and useful work of that kind produced by the ancients. Schrevelius published a good edition of it in 1668, in 4to. with notes; but the best are those of John Alberti, printed at Leyden in 1746, and Ruhnkenius, in 1776; both in 2 vols. folio.

HET'EROCLITE, n. s. Fr. heteroclite; HETEROCLIT'ICAL, adj. Lat. heteroclitum. Vol. XI. Nouns declined 'irregularly; any person or thing deviating from the common rule.

In the mention of sins *heteroclitical*, and such as want either name or precedent, there is oft-times a sin, even in their historics. Browne.

The heteroelite nouns of the Latin should not be touched in the first learning of the rudiments of the tongue. Watts.

IETERODOX, adj. & n.s. Fr. heterodoxe; Gr. ετερος, different, and δοζα, creed or opinion A person deviating from the established opinions; a peculiar sentiment: generally applied to religious tenets.

Not only a simple *heterodox*, hut a very hard paradox it will seem, and of great absurdity, if we say attraction is unjustly appropriated unto the loadstone.

Browne's Vulgar Errours. Partiality may be observed in some to vulgar, in others to heterodox tenets. Locke.

HETERODROMUS VECTIS, a lever in which the fulcrum, or point of suspension, is between the weight and the power. It is the same with what is called a lever of the first kind.

what is called a lever of the list first f

Let the body adjacent and archient be not commaterial, but merely *heterogeneal* lowards the body that is to be preserved : such as quicksilver and white amber to herbs and flies.

Guaiacum, burnt with an open fire in a chimney, is sequestered into ashes and soot; whereas the same wood, distilled into a retort, does yield far other heterogeneities, and is resolved into oil, spirit, vinegar, water, and charoal. Boyle.

The light whose rays are all alike refrangible, I call simple, homogeneal, and similar; and that whose rays are some more refrangible than others, I call compound, heterogeneal, and dissimilar. Newton.

I have observed such *heterogeneous* bodies, which I found included in the mass of this sandstone.

Woodward.

HETEROGENEITY, in physics, is also used for the heterogeneous parts themselves \cdot in which sense, the heterogeneities of a body are the same things with its impurities.

HETEROGENEOUS NOUNS, one of the three variations in irregular nouns; or such as are of one gender in the singular number, and of another in the plural. Heterogeneous, under which are comprehended mixed nouns, are six fold. 1. Those which are of the masculine gender in the singular number, and neuter in the plural; as, hic tartarus, hac tartara. 2. Those which are masculine in the singular number, but masculine and neuter in the plural; as hic locus, hi loci, and hac loca. 3. Such as are feminine in the singular number, but neuter in the plural; as, hac carbasus, and hæc carbasa. 4. Such as are neuter in the singular number, but masculine in the plural; as, hoc cœlum, hi cæli. 5. Such as are neuter in the singular, but neuter and masculine in the plural ; as, hoc rastrum, hi rastri, and hæc rastra. And, 6, Such as are neuter in the singular, but feminine in the plural; as, hoc epulum, hæ epulæ.

HETEROS'CIANS, n. s. Gr. $t\tau \epsilon \rho \sigma c$ and $\sigma r (a.$ Those whose shadows fall only one way, as the shadows of us who live north of the tropic fall at noon always to the north. HETH, The line is a constraint of the second son of Canaan, grandson of Ham, and progenitor of the Hittites, Gen. x. 15. He dwelt southward of the promised land, at Hebron or its neighbourhood. Ephron, an inhabitant of Hebron, was a descendant of Heth, and the city in Abraham's time was peopled by his posterity. See HITTITES.

HETRURIA, or ETRURIA, in ancient geography, a celebrated country of Italy, west of the Tiber. It originally contained twelve different nations, which had each their respective monarch. Their names were Veientes, Clusini, Perusini, Cortonenses, Arretini, Vetuloni, Volaterrani, Russellani, Volscinii, Tarquinii, Falisci, and Cæretani. The inhabitants were famous for their confidence in omens, dreams, auguries, &c. They all proved powerful and resolute enemies to the rising empire of the Romans, and were conquered only after much effusion of blood.

HETTSTADT, or HECKSTADT, a mining town of Prussian Saxony, on the Wipper, in the county of Mansfeld. The mines of the neighbourhood, though less extensively worked than formerly, are considerable; and here is an elegant furnace for melting silver. Population 2750. Five miles north of Mansfeld, and nine north of Eisleben.

HEVÆI, in ancient geography, the Hivites, one of the seven nations who occupied Canaan; a numerous people, and the same with the Kadmonæi, who dwelt at the foot of Hermon and partly of Libanus, or between Libanus and Hermon, Judges iii. 3. To this Bochart refers the fables concerning Cadmus and Harmonia, changed to serpents; the name hevi denoting a wild animal, such as is a serpent. Cadmus, who is said to have carried the use of letters to Greece, seems to have been a Kadmonean; of whom the Greeks say that he came to their country from Phœnicia.

HEVELIUS, or HEVELKE (John), an astronomer of the last century, was born at Dantzic in the year 1611. He studied in Germany, England, and France, and every where obtained the esteem of the learned. He was the first who discovered a libration in the moon, and he made several important observations on the other planets. He also discovered several fixed stars, which he named the firmament of Sobieski, in honor of John HI. king of Poland. His wife was also well skilled in astronomy. In 1763 and 1769 he published a description of the instruments with which he made his observations, under the title of Machina Cœlestis. But in September of that year, while he was in the country, his house at Dautzic was burnt down, by which he lost not only his observatory and all his valuable instruments, but also a great number of copies of his Machina Cælestis. Ile died in 1687, aged seventy-six. In 1690 were published his Firmamentum Sobiscianum, and Prodromus Astronomiæ et novæ Tabulæ solares, una cum Catalogo Stellarum fixarum, in which he gives the necessary preliminaries for taking an exact catalogue of the stars. He was made a burgo-master of Dantzic; which office he is said to have executed with the utmost integrity.

HEVES, a palatinate of Upper Hungary, lately united with that of Outer Solnak. The two districts centain a population of about 180,000. The products are corn, wine, tobacco, and alum. The inhabitants, almost all of Hungarian descent, are mixed with a few Sclavonians, Germans, and gipsey wanderers. The province is named from the small town of Heves, but the diets are held at Erlau; and the archbishop of that place is upper palatine.

HEURNIUS, or VAN HEURN (John), M. D., a learned Dutch physician, born at Utrecht in 1543. He studied at Louvaine, Paris, Padua, and Pavia. On his return he was elected a magistrate of Amsterdam; after which he became professor of anatomy, and rector of the university at Leyden, where he died in 1601. He wrote commentaries on Hippocrates, and various treatises on different diseases.

HEW, v. a. Part. hewn, or hewed. Sax HEW'ER, n.s. $\{$ beapan; Teut. hauen; Goth. and Swed. huga. To cut by blows with an edged instrument; to form or shape with an axe; to form with labor or exertion: hewer, one whose employment is to cut wood or stone: when used with the particles down, it signifies to fell; up, to excavate from below; aff, to separate.

Thou hast hewed thee out a sepulchre here, as he that hewed him out a sepulchre on high. Isaiah xxii,

Upon the joint the lucky steel did light,

And made such way that hewed it quite in twain. Spenser.

Yet shall the axe of justice hew him down,

And level with the root his lofty crown. Sandys.

Brave followers, yonder stands the thorny wood, Which, by the heavens' assistance and your strength, Must hy the roots be *hewn up* yet ere night.

Shakspeare.

Id.

Scarce can I speak, my choler is so great :

Oh! I could hew up rocks and fight with flint. Id. I had purpose

Once more to hew thy target from thy brawn,

Or lose my arm for't.

He that depends

Upon your favours, swims with fins of lead,

And hews down oaks with rushes. Id. One Vane was so grievously hewn, that many thousands have died of less than half his hurts, whereof he was cured. Hayward.

Nor is it so proper to *hew out* religious reformations by the sword, as to polish them by fair and equal disputations. *King Charles.*

He from the mountain hewing timber tall,

Began to build a vessel of huge bulk. Milton.

At the building of Solomon's temple there were fourscore thousand *hewers* in the mountains. Browne. The gate was adamant; eternal frame;

Which, hewed by Mars himself, from Indian quarries came.

The labour of a god. Dryden's Fables.

Next unto bricks are preferred the square heum stone. Mortimer.

This river rises in the very heart of the Alps, and has a long valley that seems *hewn out* on purpose to give its waters a passage amidst so many rocks.

Addison on Italy.

We'll force the gate where Marcus keeps his guard, And hew down all that would oppose our passage. Addison.

I now pass my days, not studious nor idle, rather polishing old works than hewing out new.

Pope to Swift.

227

HEWSON (William), a very ingenious anatomist, was born in 1739. He was assistant to Dr. Hunter, and afterwards in partnership with him; but, on their disagreement, read anatomical lectures at his own house, in which he was seconde by Mr Falconer. He wrote Enquiries into the Properties of the Blood, and the Lymphatic System, 2 vols.; and disputed with Dr. Monro the discovery of the lymphatic system of vessels in oviparous animals. He died in 1774 in consequence of absorption from a wound received in dissecting.

HEX'AGON, n. s. HEXAG'ONAL, adj. HEXAG'ONAL, adj. A figure of six sides or angles: the most capacious of all the figures that can be added to each other without any interstice; and therefore the cells in honeycombs are of that form: applied to whatever has six sides or angles.

When I read in St. Ambrose of *hexagonies*, or sexangular cellars of bees, did I therefore conclude that they were mathematicians? Bramhall.

As for the figures of crystal, it is for the most part hexagonal, or six-cornered. Browne.

Many of them shoot into regular figures : as crystal and bastard diamonds into hexaginal. Ray.

HEXAGYNIA, from $\epsilon\xi$ six, and $\gamma\nu\nu\eta$ a female, an order of plants in the class polyandria, consisting of such as have six styles. See BOTANY.

HEXAHFDRON, in geometry, one of the five Platonic bodies, or regular solids, being the same with a cube.

HEXAM'ETER, n. s. Gr. $\xi \xi$ and $\mu \epsilon \tau \rho o \nu$. A verse of six feet.

The Latin hexameter has more feet than the English heroic. Dryden.

HEXAMETER VERSE. The first four feet may be either spondees or dactyls; the fifth is generally a dactyl, and the sixth a spondee.

Such are the following verses of Virgil:

1 2 3 4 5 6 Tityrë, | tū pätů|læ rěcŭ|bāns sůb | tēgminë | fāgī, Sīlvēs|trēm těnŭ|ī mū|sām mědī|tāris ä|vēnâ: Nōs pătri|æ fi]nēs, ēt | dūlciă | līnquīmŭs | ārvā, Nōs pătri|ām fūgi|mūs tū | Tityrë | lēntūs in | ūmbrā · Fōrmō|sām rěsŏ|nārë dŏ|cēs Amă|ryllídă | sylvās.

HEXAMILI, HEXAMILION, OF HEXAMI-LIUM, a celebrated wall, built by the emperor Emanuel in 1413, over the isthmus of Corinth. It took its name from $\epsilon \xi$ six, and $\mu i \lambda i o \nu$, which in the Romaic signifies a mile, being six miles long. The design of it was to defend Peloponnesus from the incursions of the barbarians. Amurath II. having raised the siege of Constantinople, in 1424, demolished the hexamilium, though he had before concluded a peace with the Greek emperor. The Venetians restored it in 1463, by 30,000 workmen, employed for fifteen days, and covered by an army commanded by Bertoldo d'Este, general of the land forces, and Lewis Loredano, commander of the sea. The infidels made several attempts upon it; but were repulsed, and obliged to retire from the neighbourhood thereof; but Bertoldo being killed at the siege of Corinth, which was attempted soon after, Bertino Calcinato, who took on him the command of the army, abandoned, upon the approach of the beglerbeg, both the siege and the defence of the wall, which had cost them so

dear; upon which it was finally demolished. HEXANDRIA, in botany, from $\epsilon\xi$ six, and $\alpha \nu \eta \rho$, a man, the sixth class in Linnæus's sexual method, consisting of plants with hermaphrodite flowers, furnished with six stamina of an equal length. See BOTANY.

HEXAN'GULAR, adj. Gr. "5 and Lat. angulus. Having six corners.

Hexangular sprigs or shoots of crystal.

Woodward.

HEXAPLA, from $\epsilon \xi \sin t$, and $\alpha \pi \lambda \omega I$ unfold, in church history, a Bible disposed in six columns; containing the text, and versions thereof, compiled and published by Origen, with a view to securing the sacred text from future corruptions, and to correct those that had been already introduced. Eusebius relates that Origen, after bis return from Rome under Caracalla, learned Hebrew, and began to collect the several ver-

sions that had been made of the sacred writings, and of these to compose his Tetrapla and Hexapla. But others say that he did not begin till the time of Alexarder, after he had retired into Palestine, about A. D. 231. Besides the trans-lation of the sacred writings called the Septuagint, made under Ptolemy Philadelphus, about A. A. C. 280, the Scriptures had been since translated into Greek by other interpreters. The first of those versions, or (reckoning the Septuagint) the second, was that of Aquila, a proselyte Jew, the first edition of which he published in the twelfth year of Adrian, or about A. D. 128; the third was that of Symmachus, published as is supposed, under Marcus Aurelius, but, as some say, under Septimus Severus, about A. D. 200; the fourth was that of Theodotion, prior to Symmachus's, under Commodus, or about A. D. 175. These Greek versions, says Dr. Kennicot, were made by the Jews from their corrupted copies of the Hebrew, and were designed to stand in the place of the Seventy, against which they were prejudiced, because it seemed to favor the Christians. The fifth was found at Jericho, in the reign of Caracalla, about A. D. 217; and the sixth at Nicopolis, in the reign of Alexander Severus, about A. D. 228 : lastly, Origen himself recovered part of a seventh, containing only the Psalms.

Origen, who had held frequent disputations with the Jews in Egypt and Palestine, observing that they always objected to those passages of Scripture quoted against themselves, and appealed to the Hebrew text the better to vindicate t iose passages, and confound the Jews by showing that the Seventy had given the sense of the Hebrew, or rather to show, by a number of different versions, what the real sense of the Hebrew was; undertook to reduce all the several versions into a body along with the Hebrew text, so as they might easily be confronted, and afford a mutual light to each other. He made the He-

Q 2

brew text his standard; and, allowing that corruptions might have happened, and the old Hebrew copies might and did read differently, he marked such words or sentences as were not in his Hebrew text, nor the later Greek versions, and added such words or sentences as were omitted in the Seventy, prefixing an asterisk to the additions, and an obelisk to the others. For this purpose he made cight columns; in the first he gave the Hebrew text in Hebrew characters; in the second, the same text in Greek characters; the rest were filled with the several versions above mentioned; all the columns answering verse for verse, and phrase for phrase; and in the Psalms there was a ninth column for the seventh version. This work Origen called 'E $\xi \alpha \pi \lambda \alpha$, Hexapla, q. d. sextuple, or a work of six columns, as only regarding the first six Greek versions. See TETRA-PLA. Indeed, St. Epiphanius, taking in likewise the two columns of the text, calls the work Octapla, as consisting of eight columns. This celebrated work, which Montfaucon imagines consisted of fifty large volumes, perished long ago, probably with the library at Cæsarea, where it was preserved in 653; though several ancient writers have preserved pieces of it, particularly St. Chrysostom on the Psalms, Philoponus in his Hexameron, &c. Some modern writers have earnestly endeavoured to collect fragments of the Hexapla, particularly Flaminius Nobilius, Drusius, and F. Montfaucon, in two folio volumes, printed at Paris in 1713.

HEX'APOD, n.s. Gr. $\xi \xi$ and $\pi \delta \delta \epsilon \varsigma$. An animal with six feet.

I take those to have been the hexapods, from which the greater sort of beetles come ; for that sort of herapods are eaten in America Ray.

HEXAS'TIC, a s. Gr. ## and =1x05. A poem of six lines.

HEXHAM, a town of Northumberland, with a market on Tuesday. It is seated on the Tyne, and had formerly, besides the fine old church, a celebrated abbey of which the ruins are scarcely now left. Its ancient and spacious church, which was founded in 674, is highly ornamented, in the inside, in the Gothic taste. In the choir was a beautiful oratory, now converted into a pew. On the screen, at the entrance of the choir, are several grotesque mouastic paintings. On the west of the church are the remains of the priory, which was a very spacious building. There is a large room, with an oaken roof, which was the refectory, and is now used for public entertainments. Near this place, in 1463, was fought a bloody battle, between the houses or York and Lancaster, in which the latter was defeated. Hexham is noted for its manufactory of tanned leather, shoes, and gloves; and is twenty-two miles west of Newcastle, and 279 N. N. W. of London.

HEY, interj.

Dan. and Swed. hui.

HEY, interj. HEY'DAY, interj. &n.s. Hey, and heyday, are HEY'DEGIVES, n.s. expressions of joy, or exultation; frolic: and sometimes wonder, or wildness: heydigives, a wild frol.c; dance; but now obsolete.

But friendly fairies met with many graces,

And light-foot nymphs can chase the lingering night With heudegives, and trimly trodden traces. Spenser.

At your age

The heyday in the blood is tame, it's humble, And waits upon the judgment. Shakspearc.

Thou'lt say anon he is some kin to thee, Thou spendest such heyday wit in praising him.

> 'Twas a strange riddle of a lady, Not love, if any loved her, heyday !

Hudibras.

Id.

Shadwell from the town retires, T) bless the town with peaceful lyrick, Then hey for praise and panegyrick. Prior.

HEY (John), D D. a modern divine, was born in 1734, and educated at Catherine Hall, Cambridge; whence he removed in 1758 to a fellowship in Sidney College, where he took his degree of D. D. in 1780, and became the first professor of divinity on the Norrisian foundation. This chair he resigned in 1705. He was for many years rector of Passenham, in Northamptonshire, and of Calverton, in Buckinghamshire, but resigned both in 1814 to settle in London, where he died the following year. His works are-1. Redemption, a Seatonian prize poem; 2. Lectures on Divinity, 4 vols. 8vo.; 3. Seven Sermons on several Occasions, 8vo.; 4. Discourses on the Malevolent Sentiments. 8vo.; 5. Observations on the Writings of St. Paul.

HEYDON (John), who sometimes assumed the name of Eugenius Theodidactus, was a great pretender to skill in the Rosicrucian philosophyand astrology, in the reign of king Charles I.; and wrote a considerable number of chemical and astrological works, with curious titles. This ridiculous author was much resorted to by the duke of Buckingham, who was infatuated with judicial astrology. He employed him to calculate the king's and his own nativity, and was assured that the aspects of the heavens promised to him success and fortune. The duke also employed him in some treasonable and seditious practices, for which he was sent to the Tower. He lost much of his former reputation by telling Richard Cromwell and Thurloe, who went to him disgulsed like cavaliers, that Oliver would infallibly be hanged by a certain time; which he outlived several years.

HEYDON, a borough in the East Riding of Yorkshire, with a market on Thursday. It is seated on a river, which soon falls into the Humber; and was formerly a considerable town, but is now much decayed. It is a corporation, governed by a mayor, recorder, nine aldermen, two bailiffs who have the power of choosing sheriffs, and are justices of the peace. It returns two members to parliament, chosen by the burgesses, who claim their privilege either by descent, by seven years' apprenticeship to a freeman, or by an honorary gift at the discretion of the corporation. It is eight miles west from Hull, and 182 from London.

HEYLIN (Dr. Peter), an eminent English writer, born at Burford in Oxfordshire, in 1600. He studied at Hart Hall, Oxford, where he took his degrees of M.A. and D. D., and became an able geographer and historian. He was appointed one of the chaplains in ordinary to king Charles I., rector of Hemingford in Hunting-

donshire, a prebendary of Westminster, and obtained several other livings; but of these he was deprived by the parliament, who also sequestered his estate ; by which means he and his family were reduced to great necessity. However, upon the Restoration, he was restored to his spiritualities ' but never rose higher than to be sub-dean of Westminster. He died in 1662, and was interred in Westminster, where a neat monument was erected to his memory. His writings are very numerous: the principal of which are, 1. Microeosmus, or a Description of the Great World. 2. Cosmographia. 3. The History of St. George. 4. Ecclesia Vindicata, or the Church of England justified. 5. Ilistorical and Miscellaneous Tracts, &c.

HEYNE (Christian Gottlob), a celebrated modern German critic, was the son of a weaver of Glogau in Silesia, and born in 1729. But at a very early age Heyne taught other children, to provide funds for the extension of his own education. He completed his education at Leipsic, where he soon obtained reputation for his classical acquirements, and was assisted by the post of librarian to count Bruhl. He also increased his narrow income by translations of French and English works. In 1755 appeared his edition of Tibullus, and soon after that of Epictetus. He was involved in great distress by the seven years' war; the entry of the Prussians into Dresden leading to the dispersion of count Bruhl's library. He was, however, taken into the family of Von Schonberg as a tutor, in which situation he married, and in 1763 succeeded Gesner as professor of rhetoric at Gottingen. Here he also became secretary to the Society of Sciences. In 1775 he formed a catalogue of the library at Gottingen, in which laborious work, extending to 150 folio volumes, he was warmly encouraged by his late majesty George III., whose three younger sons were for some time under his tuition. He died suddenly, July 12th, 1814, leaving three children by a first wife, and six by a second. Ilis principal works are his editions of Homer and Virgil, with notes and elucidations; and Opuscula Academica, 6 vols. 8vo.

HEYTESBURY, a borough standing on the river Willey, four miles cast from Warminster, and ninety-two from London. The church, formerly collegiate, is a spacious building; it is built in the form of a cross, with a tower in the centre, containing six hells; and is about 400 years old. Here is a well endowed hospital, and a grammar-school. The greater part of this town was destroyed by fire in 1766, since which the houses have been commodiously rebuilt, which has greatly improved its appearance. It consists principally of one wide street. It is an ancient borough by prescription, and sends two members to parliament, who are elected by the burgage holders. A considerable woollen manufacture is established here, which has much increased its population.

HEYWOOD (Eliza), one of the most voluminons novel writers this island ever produced; of whose origin we know no more than that her father was a tradesman, and that she was born about 1696. In the early part of her life, her pen, whether to gratify her own disposition, or the

229

prevailing taste, dealt chiefly in licentious tales, and memoirs of personal scandal : the celebrated Atalantis of Mrs. Manley served her for a model; and the Court of Carimania, the New Utopia, with some other pieces of a like nature, were the copies her genius produced. She also attempted dramatic writing and performance, but did not succeed in either. Whatever it was that provoked the resentment of Pope, he gave full scope to it by distinguishing her as gaining one of the prizes in the games introduced in honor of dullness, in his Dunciad. Nevertheless, it is undeniable, that there is much spirit and ingenuity in her manner of treating subjects, which the friends of virtue may perhaps wish she had never meddled with at all. But, whatever offence she may have given to delicacy or morality in her early works, she appears to have endeavoured to atone for, in the latter part of her life; as no author then appeared a greater advocate for virtue. Among her riper productions may be specified, The history of Miss Betsy Thoughtless, 4 vols.; The Female Spectator, 4 vols.; Jemmy and Jenny Jessainy, 3 vols.; The Invisible Spy, 4 vols.; with a pamphlet entitled A Present for a Servant Maid. She died in 1759.

HEYWOOD (John), one of the most ancient dramatic poets, was born at North Mims, near St. Alban's in Hertfordshire, and educated at Oxford. Thence he retired to the place of his nativity; where he became acquainted with Sir Thomas More, who had a seat in that neighbourhood. This patron of genius introduced him to the princess Mary, and afterwards to her father Henry VIII., who was much delighted with his wit and skill in music, and by whom he was frequently rewarded. When Mary came to the crown Heywood became a favorite at court. On the accession of Elizabeth, being a zealous Papist, he decamped, and settled at Mechlin in Flanders, where he died in 1565. He was a man of no great learning, nor were his poetical talents extraordinary; but he possessed talents of more importance in the times in which he lived, namely, those of a jester. He wrote several plays; 500 epigrams; A Dialogue in Verse concerning English Proverbs; and The Spider and Fly, a Parable, a thick 4to. Before the title of this last work is a whole-length wooden print of the author; who is also represented at the head of every chapter of the book, of which there are seventy-seven. He left two sons, who both became eminent Jesuits.

HEZEKIAH, or EZEKIAS, Heb. החקיה, i.e. the strength of Jah or Jehovah, one of the best kings of Judea, succeeded his father Ahaz, A. M. 3278. His reformation of his subjects from idelatry; his grand and solemn celebration of the passover; his invitation to the Israelites to assist at it; his throwing off the Assyrian yoke; his miraculous deliverance from the invasion by Sennacherib, after the blasphemous defiance of Rabshakeh; his mortal disease, prophetic prayer, and miraculous recovery, with the fatal consequences of his vanity after it, are recorded in 2 Kings xviii. —xxi; 2 Chron. xxix.—xxxii.; and Isaiab xxxvi. —xxxix. He collected the proverbs of Solomon, contaided in the xxv., xxvi., xxvii., xxix., chapters of that book. See Prov. xxv. Upon the miraculous retrogression of the shadow on Ahaz's dial, we need say little. Those who doubt the existence of a Deity, or deny his power over the material world, will not be convinced by any arguments. But those who believe that the Almighty, when he gave existence to matter, and subjected it to certain laws, did not thereby limit his own infinite power, will not think it more incredible, that he who created light by his word should invert the shadow of the gnomon, so as to make it appear to have gone ten degrees backward, than that a watchmaker should turn back the hour or minutehand of a clock, in a direction contrary to the natural motion which he himself has given it. How this was done, whether by a momentary retrograde motion given to the terrestrial globe, or only by an inversion of the usual motion of the solar rays upon the gnomon, it is neither necessary nor possible to determine. See AJAlon. Upon the former supposition it must have been observed over one half of the globe. That it was however observed by the Chaldean astronomers at Babylon, seems evident from Merodach-Baladan's congratulatory embassy on Hezekiah's recovery. Hezekiah died in the fifty-fourth year of his age, and twenty-ninth of his reign, A. M. 3307.

HIARBAS, a king of the Getulians, who made war against queen Dido.

HIATION, n.s. Lat. hio, hiatus. The HIATION, n.s. act of gaping; an aperture; a breach; the opening of the mouth by the succession of an initial to a final vowel.

Men observing the continual hiation, or holding open the cameleon's mouth, conceive the intention thereof to receive the aliment of air; but this is also occasioned by the greatness of the lungs. Browne.

Those hiatus's are at the bottom of the sea, whereby the abyss below opens into and communicates with it. Woodward.

The hiatus should be avoided with more care in poetry than in oratory; and I would try to prevent it, unless where the cutting it off is more prejudicial to the sound than the hiatus itself. Pope.

HIATUS is particularly applied to those verses where one word ends with a vowel, and the following word begins with one, and thereby occasions the mouth to be more open, and the sound to be very harsh. It is also used in speaking of MSS., to denote their defects, or the parts that have been lost or effaced.

111BER'NAL, adj. Lat. hibernus. Belonging to the winter.

This star should rather manifest its warming power in the Winter, when it remains conjoined with the sun in its hibernal conversion. Browne.

IHBERNIA, one of the ancient names of Ireland, is derived by some from hibernum tempus, winter time, because in that season the nights are long there. But it appears more probable that it has been derived from Erin, the name given to the island by the original inhabitants; whence Jerna, the name given it by Claudian, Iverna by Ptolemy, and Juverna by Juvenal, are evidently derived. See IRELAND.

IIIBISCUS, Syrian mallow, a genus of the polyandria order, and monadelph a class of plants; natural order thirty-seventh, columni-

feræ: CAL. double, the exterior one polyphyllous: CAPS. quinquelocular and polyspermous. Of this genus there are thirty-six species; the most remarkable are,

1. H. abelmoschus, the musk-seeded hibiscus, a native of the West Indies, where the French cultivate great quantities of it. The plant rises with an herbaccous stalk three or four feet high, sending out two or three side branches, garnished with large leaves cut into six or seven acute angles, sawed on their edges, having long footstalks, and placed alternately. The stalks and leaves are very hairy. The flowers come out from the wings of the leaves upon pretty long foot-stalks which stand erect. They are large, of a sulphur color, with purple bottoms; and are succeeded by pyramidical five-cornered capsules, which open in five cells, filled with large kidney-shaped seeds of a very musky odor. It is annual in this country, though biennial in places where it is native. It is propagated by seeds, and is cultivated in the West Indies by the French for the sake of its seeds.

2. II. esculentus, the eatable hibiscus, rises to five or six feet; has broad five-parted leaves, and large yellow flowers. The okra or pod is from two to six inches long, and one inch diameter. When ripe it opens longitudinally in five different places, and discharges a number of heart-shaped seeds. It is a native of the West Indies, where it is cultivated in gardens and enclosures as an article of food. The whole of it is mucilaginous, especially the pods. 'These,' Dr. Wright informs us, 'are gathered green, cut into pieces, dried, and sent home as presents, or are boiled in broths or soups for food. It is the chief ingredient in the celebrated pepper-pot of the West Indies, which is a rich olla; the other articles are either flesh meat, or dried fish and capsicum. This dish is very palatable and nourishing. As a medicine, okra is employed in all cases where emollients and lubricants are indicated.'

3. II. mutabilis, the changeable rose, has a soft spungy stem, which, by age, becomes ligneous and pithy. It rises to the height of twelve or fourteen feet, sending out branches towards the top, which are hairy, garnished with heartshaped leaves, cut into five acute angles on their borders, and slightly sawed on their edges; of a lucid green on their upper side, but pale below. The flowers are produced from the wings of the leaves; the single are composed of five petals, which spread open, and are at first white, but afterwards change to a bluish-rose color, and, as they decay, turn purple. In the West Indies all these alterations happen on the same day, and the flowers themselves are of no longer duration; but in Britain the changes are not so sudden. The flowers are surrounded by short, thick, blunt capsules, which are very hairy; having five cells, which contain many small kidneyshaped seeds, having a fine plume of fibrous down adhering to them.

4. H. rosa Sincnsis, the China rose, has an arborescent stem, and egg-pointed sawed leaves. It is a native of the East Indies; but, the seeds having been carried by the French to their West India settlements, it thence obtained the name

of Martinico rose. Of this there are the double and single flowering kinds; the seeds of the first frequently produce plants that have only single flowers, but the latter seldom vary to the double kind.

5. II. Syriacus, commonly called althwa frutex, is a native of Syria. It rises with shrubby stalks to the height of eight or ten feet, sending out many woody branches covered with a smooth gray bark, garnished with oval spear-shaped leaves, whose upper parts are frequently divided into three lobes. The flowers come out from the wings of the stalk at every joint of the same year's shoot. They are large and shaped like those of the mallow, having five large roundish petals which join at their base, spreading open at the top in the shape of an open bell. These appear in August; and, if the season is not too warm, there will be a succession of flowers till September. The flowers are succeeded by short capsules with five cells, filled with kidney-shaped seeds; but, unless the season proves warm, they will not ripen in this country. Of this species there are four or five varieties, differing in the color of their flowers: the most common has pale purple flowers with dark bottoms; another has bright purple flowers with black bottoms; a third has white flowers with purple bottoms; and a fourth variegated flowers with dark bottoms. There are also two with variegated leaves, which are by some much esteemed. All these varieties are very ornamental in a garden. They may be propagated either by seeds or cuttings. The seeds may be sown in pots filled with light earth about the end of March, and the young plants transplanted about the same time next year. They succeed in full ground, but must be covered in winter whilst young, otherwise they are apt to be destroyed.

6. II. tiliaceus, the maho tree, is a native of both the Indies. It rises with a woody, pithy stem, ten feet high, dividing into several branches towards the top, which are covered with a woolly down, garnished with heart-shaped leaves ending in acute points They are of a lucid green on their upper side, heary on the under side, full of large veins, and are placed alternately. The flowers are produced in loose spikes at the end of the branches, and are of a whitish-yellow color. They are succeeded by short acuminated capsules, opening in five cells, filled with kidneyshaped seeds. It is propagated by seeds. The inner rind is very strong, and of great esteem. Dampier says, 'They (the Musketo Indians) make their lines, both for fishing and striking, with the bark of maho, which is a sort of tree or shrub that grows plentifully all over the West Indies, and whose bark is made up of strings or threads very strong : you may draw it off either in flakes or small threads, as you have occasion. It is fit for any manner of cordage, and privateers often make their rigging of it.

7. H. trionum, Venice mallow, or flower of an hour, is a native of some parts of Italy, and has long been cultivated in the gardens of this country. It rises with a branching stalk a foot and a half high, having many short spines, which are soft, and do not appear unless closely viewed. The leaves are divided into three lobes, which

are deeply jagged almost to the midrib. The flowers come out at the joints of the stalks, upon pretty long foot-stalks. They have a double empalement: the outer being composed of ten long narrow leaves, which join at their base; the inner is of one thin leaf swollen like a bladder, cut into five acute segments at the top, having many longitudinal purple ribs, and is hairy. Both these are permanent, and enclose the cap-sule after the flower is past. The flower is com-posed of five obtuse petals, which spread open at the top; the lower part forming an open bellshaped flower. These have dark purple bottoms, but are of a pale sulphur color above. In hot weather the flowers continue but a few hours open, whence the English name; but there is a succession of flowers that open daily for a considerable time. It is propagated by seeds, which should be sown where the plants are designed to remain, for they do not well bear transplanting. They require no other culture than to be kept free from weeds, and thinned where they are too close; and, if the seeds are permitted to scatter, the plants will come up fully as well as if they had been sown.

HICCIUS Doccius, *n. s.* 'Corrupted, I fancy, from hic est doctus, this, or here is the learned man.'—Dr. Johnson. Used by jugglers of themselves. A cant word for a juggler; one that plays fast and loose.

An old dull sot, who told the clock For many years at Bridewell dock, At Westminster and Hicks's hall And hiceius doccius played in all; Where, in all governments and times, H' had been both friend and foe to crimes.

Hudibras

HIC'COUGH, n. s. & v. n. Dan. hicken; IIICK'UP, v. n. Swedish, hicka; Belg. hik, hickse. A convulsive action of the diaphragm, producing sobs: hickup is a corruption of hiccough.

So by an abbey's skeleton of late

I heard an echo supercrogate

Through imperfection, and the voice restore,

As if she had the *hiccough* o'cr and o'er.

Cleaveland,

Quoth he, to bid me not to love,

Is to forbid my pulse to move,

My beard to grow, my ears to prick up,

Or, when I'm in a fit, to *kickup*. Hudibras. Sneezing cureth the *hiccough*, and is profitable unto

women in hard labour. Browne's Vulgar Errours. If the stomach be hurt, singultus, or hiecough follows. Wiseman.

HICCOUGH, or HICKUP, is a spasmodic affection of the stomach, œsophagus, and muscles subservient to deglutition, arising sometimes from some particular stimulus acting on the stomach, œsophagus, diaphragm, &c., and sometimes from a general affection of the nervous system. See MEDICINE.

HICETAS of Syracuse, an ancient philosopher and astronomer, who taught that the sun and stars were motionless, and that the earth moved round them. This is mentioned by Cicero, and possibly gave the first hint of the true system to Copernicus. He flourished "bout A. A. C. 344.

HICKES (George), a celebrated English divine, born in 1642. In 1681 he was made

Nature and nature's laws lay hid in night:

God said, Let Newton be, and all was light. Pope. The boys and girls would venture to come and play at hide and seek in my hair. Gulliver's Travels.

HIDAGE, HIDAGIUM, was an extraordinary tax payable to the kings of England for every hide of land. This taxation was levied not only in money, but in provision, armour, &c.; and when the Danes landed in Sandwich, in 994, king Ethelred taxed all his lands by hides; so that every 310 hides found one ship furnished, and every eight hides furnished one jack and one saddle, to arm for the defence of the kingdom. &c. Sometimes the word hidage was used for the being quit of that tax; which was also called hidegild, from the Saxon, 'a price or ransom paid to save one's skin or hide from beating.'

HIDALGO, in modern history, a title given in Spain to all who are of noble family. The Hidalgos claim a descent from those valiant soldiers who retired into Castile, and the mountains of Asturias, and other remote parts of Spain, on the invasion of the Moors, where, having fortified themselves, they successively descended into the plains, in proportion to the success of their arms: from the notoriety of their persons, or the lands they became possessed of, they acquired the appellation of Hidalgos notorios, Hidalgos de solor conocido, or de casa solariega. Otalora says that the true meaning of Hidalgos de solar conocido is explained by the laws of Castile to be a wellknown mansion or possession, the nature of which is particularly explained in the laws of Perditas, which describe three sorts of tenures called devisa, solariega, and behetria. By the first, lands are devised by the ancestor; solariega is a tenure upon another person's manor, and obliges the owner to receive the lord of the fee when necessity obliges him to travel; and behetria is of the nature of an allodium. In proportion as these aborigines gained ground on the Moors, and increased in their numbers, many private persons distinguished themselves by their valor, and obtained testimonies of their services called cartas de merced, which served them as a foundation of their birth and good descent, without which documents their posterity could not make it appear; and if, from lapse of time, or other unavoidable accidents, such proofs should happen to be lost or destroyed, the law affords them a remedy, by a declaration, importing, that such persons as are supposed to have had such certificates, may be relieved by making it appear that their ancestors, time immemorial, have always been held and reputed as Hidalgos, and enjoyed the privileges of such, from a strong presumption in their favor; the possession of land having equal force to any other document; which is fully set forth in the Pragmatica of Cordova.

Ilidalgo y Costilla (Don Miguel), a priest, who first kindled the insurrection in Mexico, which has resulted in the independence of that country. He was the resident clergyman in the town of Dolores, in the intendencia of Goanaxoato, and regarded as a man of talents in early life. His intercourse with the Indian population af forded him opportunities of perceiving their dislike to the Spaniards; and this led him to from

king's chaplain, and two years after dean of Worcester. The death of Charles II. stopped his farther preferment; for, though his church principles were very high, he manifested too much zeal againt popery to be a favorite with James II. On the revolution, he with many others was deprived for refusing to take the oaths to king William and queen Mary; and soon after, archbishop Sancroft and his colleagues, considering how to maintain episcopal succession among those who adhered to them, Dr. Hickes carried over a list of the deprived clergy to king James; and with his sanction a private consecration was performed, at which it is said lord Clarendon was present. Dr. Hickes was consecrated suffragan bishop of Thetford, and died in 1715. He wrote 1. Institutiones Grammaticæ Anglo-Saxonicæ, et Mæso-Gothicæ. 2. Antiqua Literatura Septentrionalis. 3. Two treatises, one of the Christian priesthood; the other of the dignity of the episcopal order. 4. Jovian, or an answer to Julian the Apostate. Three volumes of sermons: with many temporary controversial pieces on politics and religion.

HICK'WALL, n.s. Old words for a wood-§ pecker. HICK'WAY, n. s.

Sax. broan; Belg. IIID, part. hoedan; Teut. huten. To conceal; to with-HID'DEN, part. HIDE, v. a. & v. n. hold or withdraw from sight or know-HIDE AND SEEK, n. s. HIDER, n. s. ledge: to lie concealed: hide and seek, a play in

which some hide themselves and others seek them. For fere almost out of his wit he brayde,

And to his goddes pitously he preide

For socour; but it mighte not betide :

For drede of his him thoughte that he diede, And ran into a garden him to hide.

Chaucer. The Monkes Tale. Avaunt, and quit my sight ; let the earth hide thee ! Shakspeare.

His reasons are as two grains of wheat hid in two Id. Merchant of Venice. bushels of chaff.

Thus fame shall be atchieved, renown on carth ; And what most merits fame, in silence hid. Milton.

Other hidden cause

Left them superior. Id. Blame not the muse that brought those spots to sight,

Which in your splendor hid corrode your light. Marvell.

Saturnian spite pursues me through the earth, No corners left to hide my long-wished birth. Id.

Seas hid with navies, chariots passing o'er The channel, on a bridge from shore to shore.

Dryden.

Nile hears him knocking at his sevenfold gates, And seeks his hidden spring, and fears his nephews' fates. Id.

Then for my corps a homely grave provide, Which love and me from public scorn may hide.

A fox, hard run, begged of a countryman to help L'Estrange. him to some hiding place.

With what astonishment and veneration may we look into our own seuls, where there are such hidden stores of virtue and knowledge, such inexhausted sources of perfection ? Addison.

Hell trembles at the sight, and hides its head In utmost darkness, while on earth each heart Rowe's Royal Convert. Is filled with peace.

the plan of a general revolt. Circumstances hastened the execution of the scheme; and captain Allende, having collected a few soldiers, marched to Dolores, where he arrived on the 10th of September 1810, and joined Hidalgo. Allende and the priest, at the head of the insurgents, now pillaged the houses of the Spaniards in the town of San Miguel el Grande; and on the 29th of September gained possession of Goanaxoato, in the treasury of which town they found a large quantity of coin and silver bars. Don J. Villegas, appointed viceroy by the regency of Cadiz, arrived at this period at Mexico, and sent a body of troops against Hidalgo. His measures at first however were ineffectual; Hidalgo attached the Indians to his cause, by repealing the tax called tributos, which they had paid ever since their original conquest. From Goanaxoato he marched on Valladolid October the 20th, and was joyfully received by two regiments of militia. Soon after, being proclaimed generalissimo of the Mexican forces, he found himself at the head of eighty regiments, of 1000 men each. He now, therefore, proceeded towards Mexico, when Villegas, having but a handful of roops for its defence, applied to the archbishop of Mexico, and to the inquisition, for a sentence of excommunication against Hidalgo and his adherents. This awed the Mexicans from joining the insurgents; disappointed their expectations of assistance; and Hidalgo became irresolute. After having waited in the neighbourhood of the capital till the viceroy had recalled his troops, he began a retreat. At Aculco, however, he was overtaken and completely defeated, on the 7th of November. He then retired to Goanaxoato, whither he was followed by the Spanish army, who took the place with great slaughter. Hidalgo fled to Guadalaxara; and on the 17th of January, 1811, suffered a further and ruinous defeat at the bridge of Calderon. One of his own officers delivered him up on the 21st of March, 1811; and having previously been degraded from the priesthood he was put to death on the 27th of July that year.

IHDDENSOE, a small island of Pomerania, off the west coast of the island of Rugen. The pasture is tolerable; but the inhabitants, who amount to about 500, are chiefly fishermen. It is ten miles long and two broad. Long. 13° 10' E., lat. 54° 35' N.

HIDE, n. s. Sax. by Se; Belg. HIDE, n. s. Shinde; Tent. haut. The skin of an animal either raw or dressed; the human skin in contempt; a certain quantity of land: hidebound, being in the state in which the bark will not give way to the growth; harsh; untractable; niggardly; penurious. A horse is said to be hidebound when his skin sticks so hard to his ribs and back, that you cannot with your hand pull up or loosen the one from the other. It sometimes comes by poverty and bad keeping; at other times from over-riding, or a surfeit.

Oh, tiger's heart, wrapt in a woman's hide !

How could'st thou drain the life-blood of the child? Shakspeare.

A root of a tree may be *hidebound*, but it will not keep open without somewhat put into it. Bacon. One of the first things was a more particular inquisition than had been before of every *hide* of land within the precincts of his conquest, and how they were holden. *Wotton.*

And still the harsher and hidebounder

The damsels prove, become the fonder.

Hudibras.

His mantle, now his *hide*, with rugged hairs Cleaves to his back ; a famished face he bears. Dryden.

The trembling weapon past

Through nine bull *hides*, each under other placed On his broad shield. *Id.*

Pisistratus was first to grasp their hands, And spread soft *hides* upon the yellow sands.

Like stinted hidebound trees, that just have got Sufficient sap at once to bear and rot.

HIDE is particularly applied to the skin of large cattle, as bullocks, cows, horses, &c. Hides are either raw, that is just as taken off the carcase : salted, or seasoned with salt, alum, and saltpetre, to prevent their spoiling : or curried and tanned. See TANNING.

HIDE OF LAND was as much as would maintain a family : some call it sixty, some eighty, and others 100 acres.

IIID'EOUS, adj. HID'EOUSLY, adv. HID'EOUSLY, adv. Spenser in a sense not now retained; detestable.

With that the chorle his clubbe gan shake ; Frowning his eyen gan to make An hideous chere, as man in rage ; For yre he brent in his viage.

Chaucer. Romaunt of the Rose. The brighte swerdes wenten to and fro So hideously, that with the leste stroke,

It semed that it wolde felle an oke.

Id. The Knightes Tale. O hideous hanger of dominion ! Spenser. I arm myself

To welcome the condition of the time;

Which cannot look more hideously on me,

Than I have drawn it in my fantasy. Shakspeare. Some monsters in my thoughts,

Too hideous to be shewn. Id. Othello.

I fled, and cryed out death !

Hell trembled at the *hideons* name, and sighed From all her caves, and back resounded death.

If he could have turned himself to as many forms as Proteus, every form should have been made hideous. Sidney.

Her eyes grew stiffened, and with sulphur burn; Her hideous looks and hellish form return; Her curling snakes with hissings fill the place,

And open all the furies of her face. Dreden.

This, in the present application, is hideously profane; but the sense is intelligible.

Collier's Defence.

"Tis forced through the hiatuses at the bottom of the sea with such vehemence, that it puts the sea into the most horrible disorder, making it rage and roar with the most *hideous* and amazing noise.

Woodward's Natural History.

- What avails it that indulgent heaven
- From mortal eyes, has wrapt the wors to come If we, ingenious, to torment ourselves,

Grow pale at hideous fictions of our own?

Armstrong.

Milton.

The presbytery had more sympathy with the discipline of Scotlaud than the hierarchy of England. Bacon.

He rounds the air, and breaks the hymnick notes In birds, heav'n's choristers, organick throate ; Which, if they did not die, might seem to be Donne. A tenth rank in the heavenly hierarchy.

Out of the hierarchies of angels sheen,

The gentle Gabriel called he from the rest.

Fairfax.

The blessedest of mortal wights, now questionless the highest saint in the celestial hierarchy, began to be so importuned, that a great part of the divine liturgy was addressed solely to her. Howel.

Angels, by imperial summons called,

Forthwith from all the ends of heaven appeared, Under their hierarchs in orders bright. Milton. These the supreme king

Exalted to such power, and gave to rule,

Each in his hierarchy, the orders bright. Id When an old Scotch covenanter shall be

The champion for the English hierarchy. Marvell.

While the old Levitical hierarchy continued, it was part of the ministerial office to slay the sacrifices.

South.

Consider what I have written, from regard for the church established under the hierarchy of bishops.

Swift.

HIERACITES, in church history, Christian heretics in the third century : so called from their leader Hierax, a philosopher of Egypt; who taught that Melchisedek was the Holy Ghost, denied the resurrection, and condemned marriage.

HIERACIUM, hawkweed; a genus of the polygamia æqualis order, and syngenesia class of plants; natural order forty-ninth, compositæ. The receptacle is naked: CAL. imbricated and ovate; the pappus simple and sessile. The most common species are,

1. H. aurantiacum, commonly called Grim the collier, has many oblong, oval, entire leaves, crowning the root; an upright, single, hairy, and almost leafless stalk, a foot high, terminated by reddish orange-colored flowers in a corymbus. These flowers have dark, oval, ash-colored, calyces; whence the name. This is the only species cultivated in gardens. It is propagated The seed may by seeds or parting the roots: be sown in antumn or spring. In June, when the plants are two or three inches high, they may be picked out and planted in beds, where they must be left till the next autumn, and then transplanted where they are to remain.

2. II. Pilos ella, the mouse-ear, has blossoms red on the outside, and pale yellow within; the cups set thick with black hairs. The flowers open at 8 A. M., and close about 2 P. M. It grows commonly in dry pastures in England; it has a milky juice, but is less bitter and astringent than is usual with plants of that class. It is reckoned hurtful to sheep. Goats eat it; sheep are not fond of it; horses and swine refuse ıt.

3. IL umbellatum grows to the height of three feet, with an erect and firm stalk, terminated with an umbel of yellow flowers. It is a native of Scotland, and grows in rough stony places, but is not very common. The flowers are

HIDJELLE, HIJALI, or INGELLEE, a town in the province of Bengal, situated on the west bank of the Hooghly River, fifty-five miles S.S.W. During the Mogul government from Calcutta. it was the capital of a foujdarry or military station, comprehending 1098 square miles. This district is situated on the low margin of the river Hooghly, where it unites with the bay of Bengal. It was first dismembered from the Soubah of Orissa, and annexed to Bengal, in the reign of Shah Jehan; and is very productive in grain and salt. 'The salt land is that portion exposed to the overflowing of the tides, usually called the churs or banks; where mounds of earth, strongly impregnated with saline particles, named kalaries or working-places, are formed. Each of these heaps is estimated on a medium to yield 233 maunds (eighty 'bs. each) of salt, requiring the labor of seven manufacturers; who, by an easy process of filtration and boiling, are enabled to complete their operations from November to June, before the setting in of the periodical rains." Hamilton.

Sax. biezan; Goth heya. HIE, v. n. To hasten; to go in haste.

Thus in hir doubtes as they stode-

Waxing the se, coming the flode-

Was cried : 'To ship goe every wight :'

Then was, but hie that hie him might.

Chaucer's Dreame. When they had marked the changed skies,

They wist their hour was spent; then each to rest Id. Faerie Queene. him hies. My will is even this,

That presently you hie you home to bed.

Shakspeare.

Well, I will hie,

And so bestow these papers as you bade me. Id. Auster spyed him

Cruel Auster hither hyed him. Crashaw. The snake no sooner hist,

But virtue heard it, and away she hyed. Id. Some to the shores do fly,

Some to the woods, or whither fear advised :

But running from, all to destruction hie. Daniel. Thither, full fraught with mischievous revenge,

Accursed, and in a cursed hour, he hies. Milton.

Thus he advised me, on yon aged tree Hang up thy lute, and hie thee to the sea.

Waller.

Sandys.

The youth, returning to his mistress hies. Dryden.

His folded flocks secure, the shepherd home Hies merry hearted, and by turns relieves The ruddy milk-maid of her brimming.pail.

Thomson's Seasons.

IIIELMAR, a lake between Sudermannland and Nericia, in the central part of Sweden, communicating with the lake of Malar. It is about forty miles long, but of small width; and contains a number of rocks and islands. Sixty miles west of Stockholm.

HTERARCH, n. s. HTERARCHL, n. s. HTERARCHL, adj. HTERARCHL, n. s. The chief of a sacred

order : hierarchy, a sacred government; rank, or subordination of holy beings; the ecclesiastical establishment.

Jehovah, from the summit of the sky,

Environed with his winged hierarchy,

The world surveyed.

H1ERAPOLIS, in ancient geography, a town of Phrygia, abounding in hot springs, and having its name from the number of its temples. There are coins exhibiting figures of various gods who had temples here. Of this place was Epictetus the stoic philosopher. It is now called Pambouk; and is situated near the Scamander, on a portion of Mount Mesogis, six miles from Laodicea. The worship of the great Syrian goddess, called Atergatis, was established in this town; but no traces now remain of her temple. The only remarkable monument is a subterraneous canal, which conducts the water from the mountains of the north for the distance of four leagues.

HIERARCHY. Some of the rabbies reckon four, others ten, orders or ranks of angels; and give them different names according to their supposed degrees of power and knowledge.

HIERES, ISLES or, is the name of a cluster of three small islands of the Mediterranean, near the south coast of France, and about eleven miles from the town of Hieres. They are called Porquerolles, Porticros, and the isle of Titan. Giens, sometimes reckoned one of them, is more properly a peninsula. Porquerolles, the largest, does not contain 100 inhabitants. Porticros, three leagues farther to the east, and more elevated, has a small harbour, but only fifty inhabitants. All of them are defended by forts.

HIERES, a town in the department of the Var France, nine miles east of Toulon. It is at the foot of a steep rock or mountain, surrounded by a beautiful plain. The old town, which stood on the high part of the mountain, has been abandoned. On entering the new town the streets are found to be mean and dirty, and singularly contrasted with the neat white houses of which they are composed. The environs are pleasant; abounding with gardens containing the best fruits, particularly oranges, and covered with verdure throughout the year. But the air of Hieres is unhealthy, owing to exhalations from the marshes, and from a salt lake in the neighbourhood. Here great quantities of salt are obtained, and exported, as well as oil, wine, and fruit, to Toulon and Marseilles. Hieres was formerly a sea-port of consequence : but the sea has now retired to the distance of a league. The celebrated Massillon was born here. Population 7000.

HIERO I., king of Syracuse, succeeded his brother Gelon, A. A. C. 478. He made war against Theron, tyrant of Agrigentum, and took Himera. He gained three crowns at the Olympic games by horse and chariot racing, for which he is celebrated by Pindar; whese conversation, with that of other literati, rendered him humane and liberal. He died A. A. C. 467.

HIERO II., king of Syracuse, was a descendant of Gelon, and was cleeted king A. A. C. 268. He carried on war against the Romans for some time along with the Carthaginians; but made peace, and continued ever after their firm ally. He was a relation of Archimedes; and was a prince of great learning and virtue, and encouraged arts and commerce. He died A. A. C. 225.

HIERO'S CROWN, in hydrostatics. Iliero II., having furnished a goldsmith with a quantity of fine gold to make a crown, suspected, upon receiving it, that he had been cheated, by his using a greater quantity of silver alloy than was necessary. He applied to Archimedes to discover the fraud without defacing the crown; which he did by this experiment: He procured a ball of pure gold and another of silver, each exactly of the same weight with the crown; and judging that if the crown were of pure gold it would be of equal bulk, and, upon putting it in water, expel an equal quantity of the water with the golden ball; if of silver, it would expel an equal quantity with the silver one; but, if of an intermediate quality, the quantity of water expelled would be in exact proportion. This upon trial he found to be the case; and, by comparing the quantities of water displaced, discovered the proportions of gold and silver in the crown.

HIEROCLES, a cruel persecutor of the Christians, and a violent promoter of the persecution under Dioclesian, flourished A D. 302. He wrote some books against the Christian religion; in which he aims to show some inconsistencies in the Holy Scriptures, and compares the miracles' of Apollonius Tyanæus to those of our Saviour. He was refuted by Lactantius and Eusebius. The remains of his works were collected into one volume by bishop Pearson; and published in 1654, with a learned dissertation prefixed.

HIEROCLES, a Platonic philosopher of the fifth century, who taught at Alexandria, and was admired for his eloquence. He wrote seven books upon Providence and Fate, dedicated to the philosopher Olympiodorus, who by his embassies did the Romans great services under Honorius and Theodosius H. But these books are lost, and we only know them by the extracts in Photius. He wrote also a Commentary upon the golden verses of Pythagoras; which is still extant, and has been several times published with those verses.

HIE ROGLYPH, n. s. HIEROGLYPH'IC, n. s. HIEROGLYPH'ICAL, adj. HIEROGLYPH'ICALLY, adv. Fr. hieroglyphe; Gr. $tepoc, \gamma\lambda v\phi\omega$. An emblem; a figure by which

a word was implied. Hieroglyphics were used before the alphabet was invented. Hieroglyph seens to be the proper substantive, and hieroglyphic the adjective. The art of writing in picture: charged with hieroglyphical sculpture; emblematical.

In this place stanos a stately *hieroglyphical* obelisk of Theban marble. Sandys's Travels.

The Egyptian scrpent figures time,

And, stripped, returns into his prime ;

If my affection thou would'st win,

First cast thy hieroglyphick skin. Cleaveland.

A lamp amongst the Egyptians is the hicroglyphick of life. Wilkins's Dædalus.

The original of the conceit was probably *hicrogly-phical*, which after became mythological, and, by a process of tradition, stole into a total verity, which was hut partly true in its morality.

Browne's Vulgar Errors.

This *hieroglyphich* of the Egyptians was crected for parental affection, manifested in the protection of her young ones, when her nest was set on fire. Others have spoken emblematically and hieroglyphically as the Egyptians, and the phomix was the hieroglyphick of the sun. Browne.

The first writing men used was only the single pictures and gravings of the things they would represent, which way of expression was afterwards called *hiero*glyphick. Woodward.

Between the statues obelisks were placed, And the learned walls with hieroglyphicks graced. Pove.

No brute can endure the taste of strong liquor, and consequently it is against all the rules of *hieroglyphick* to assign any animals as patrons of punch. *Swift*.

Your alphabet. The Deformed Transformed.

HIEROGLYPHICS were in use among the Egyptians, and that as well in their writings as inscriptions; being the figures of various animals, the parts of human bodies, and mechanical instruments. It was the custom to have the walls, doors, &c., of their temples, obelisks, &c., engraven with such figures. Hieroglyphics are properly emblems or signs of divine, sacred, or supernatural things; by which they are distinguished from common symbols, which are signs of sensible and natural things. Hermes Trismegistus is commonly esteemed the inventor of hieroglypnics: he first introduced them into the heathen theology, whence they have been transplanted into the Jewish and Christian. Sacred things, says Hippocrates, should only be communicated to sacred persons. Hence the ancient Egyptians communicated to none but their kings and priests, and those who were to succeed to the priesthood and the crown, the secrets of nature, and of their morality and history: and this they did by a kind of cabbala, which, at the same time that it instructed them, only amused the rest of the people. Hence the use of hieroglyphics, or mystic figures, to veil their morality, politics, &c., from profane eyes. This author and many others do not keep to the precise character of a hieroglyphic, but apply it to profane as well as divine things. Hieroglyphics are a kind of real characters, which do not only denote, but in some measure express the things. Thus, according to Clemens' Alexandrinus, (Stroin, v.) a lion is the hieroglyphic of strength and fortitude; a bullock, of agriculture; a horse, of liherty; a sphinx, of subtlety, &c. Such is the opinion that has generally been embraced, both by ancient and modern writers, of the origin and use of hieroglyphics. It has been almost uniformly maintained, that they were invented by the Egyptian priests to conceal their wisdom from the knowledge of the vulgar; but the late bishop Warburton has, with much ingenuity and learning, endeavoured to show that this account is erroneous. He thinks the first kind of hieroglyphics were mere pictures, because the most natural way of communicating our conceptions, by marks or figures, was by tracing out the images of things; and this is verified in the case of the Mexicans, whose only method of writing their laws and history was by this picture writing. But the hieroglyphics invented by the Egyptians were an improvement on this rude

and inconvenient essay towards writing, for they contrived to make them both pictures and characters. In order to effect this improvement, they were obliged to proceed gradually, by first making the principal circumstance of the subject stand for the whole; as in the hieroglyphics of Horapollo, which represent a battle of two armies in array by two hands, one holding a shield and the other a bow : then putting the instrument of the thing, whether real or metaphorical, for the thing itself, as an eye and sceptre to represent a monarch, a ship and pilot the governor of the universe, &c.; and finally, by making one thing stand for or represent another, where their observations of nature, or traditional superstitions led them to discover or imagine any resemblance : thus the universe was designed by a serpent in a circle, whose variegated spots denoted the stars; and a man who had nobly surmounted his misfortunes was represented by the skin of the hyæna, because this was supposed to furnish an invulnerable defence in battle. The Chinese writing, he observes, was the next kind of improvement in the use of hieroglyphics. The Egyptians joined characteristic marks to images; the Chinese threw out the images and retained only the contracted marks, and from these marks proceeded letters. The general concurrence of different people, in this method of recording their thoughts, can never be supposed to be the effect of imitation, sinister views, or chance; but must be considered as the uniform voice of nature speaking to the rude conceptions of mankind; for not only the Chinese of the East, the Mexicans of the West, and the Egyptians of the South, but the Scythians likewise of the North, and the intermediate inhabitants of the earth, viz. the Indians, Phœnicians, Ethiopians, &c., used the same way of writing by picture and hieroglyphic. He farther shows, that the several species of hieroglyphic writing took their rise from nature and necessity, and not from choice and artifice, by tracing at large the origin and progress of the art of speech. He proceeds to show how, in process of time, the Egyptian hieroglyphics came to be employed for the vehicle of mystery. They used their hieroglyphics two ways; the one more simple, by putting the part for the wnole which was the curiologic hieroglyphic; and the other more artificial, by putting one thing of resembling qualities for another, called the tropic hieroglyphic: thus the moon was sometimes represented by a half circle, and sometimes by a cynocephalus. They employed their proper hieroglyphics to record openly and plainly their laws, policies, public morals, and history, and all kinds of civil matters: this is evident from their obelisks, which were full of hieroglyphic characters, designed to record singular events, memorable actions, and new inventions; and also from the celebrated inscription on the temple of Minerva at Sais, where an infant, an old man, a hawk, a fish, and a river-horse, expressed this moral sentence : 'All you who come into the world and go out of it, know this, that the gods hate impudence.' However, the tropical hieroglyphics, which were employed to divulge, gradually produced symbols which were designed to secrete or conceal: thus Egypt was sometimes

expressed by the crocodile, sometimes by a burning censer with a heart upon it; where the simplicity of the first representation, and the abstruseness of the latter, snow that the one was a tropical hieroglyphic for communication, and the other a tropical symbol invented for secrecy. Enigmatic symbols were afterwards formed by the assemblage of different things, or of their properties that were less known; and, though they might have been intelligible at first, yet when the art of writing was invented, hieroglyphics were more generally disused; the people forgot the signification of them; and the priests, retaining and cultivating the knowledge of them, because they were the repositories of their learning and history, at length applied them to the purpose of preserving the secrets of their religion. Sir John Marsham thinks that symbols were the original of animal worship in Egypt (Can. Chron. p. 58): because in these was recorded the history of their greater deities, their kings, and lawgivers, represented by animals and other crea-tures. The symbol of each god was well known and familiar to his worshippers, by means of the popular paintings and engravings on their temples and other sacred monuments, so that the symbol presenting the idea of the god, and that idea exciting sentiments of religion, it was natural for them, in their addresses to any particular god, to turn to his representative mark or symbol; especially when we consider, that the Egyptian priests feigned a divine original for hieroglyphic characters, in order to increase the veneration of the people for them. These would of course bring on a relative devotion to these symbolic figures, which, when it came to be paid to the living animal, would soon terminate in an ultimate worship. Another consequence of the sacredness of the hieroglyphic characters was, that it disposed the more superstitious to engrave them on gems, and wear them as amulets or charms. This magical abuse seems not to have been much earlier than the established worship of the god Serapis, which happened under the Ptolemies, and was first brought to the general knowledge of the world by certain Christian heretics and natives of Egypt, who had mixed a number of Pagan superstitions with their Christianity. These gems, called abraxas, are frequently to be met with in the cabinets of the curious, and are engraven with all kinds of hieroglyphic characters. To these abraxas succeeded the talismans. See ABRAXAS.

HIEROGRAMMATEI, HIEROGRAMMATISTS, Ιερογραμματεις, i. e holy registers, were an order of priests among the ancient Egyptians, who presided over religion and lcarning. They had the care of the hieroglyphics, and were the expositors of religious doctrines. They were regarded as a kind of prophets; and it is said, that one of them predicted to an Egyptian king, that an Israelite (meaning Moses), eminent for his qualifications and achievements, would depress the Egyptian monarchy. The hierogrammatei were always near the king, to assist him with their information and counsels. The better to fit them for this, they made use of the knowledge they had acquired in the motions of the celestial luminaries, as well as the writings of their pre-

decessors, wherein their function and duties were delivered. They were exempted from all civil employments, were reputed the first persons in dignity next the king, and bore a kind of sceptre in form of a ploughshare. After Egypt became a Roman province they sunk into neglect.

HIEROG'RAPHY, n. s. Gr. "ερός and γράφω. Holy writing.

HIEROMANCY, HIEROMANTIA, LEPOHADTELA, in antiquity, that species of divination which predicted future events from observing the various things offered in sacrifice. See DIVI-NATION and SACRIFICE.

HIEROMENIA, in ancient Greek chronology, the month in which the Nemean games were celebrated, called also Boedromion.

HIEROMNEMON, Gr. from $u\rho\sigma_c$, sacred, and $\mu\nu\eta\mu\omega\nu$, a remembrancer, an officer in the ancient Greek church, whose principal function was to stand behind the patriarch at the sacraments, ceremonies, &c., and show him the prayers, psalms, &c., which he was to rehearse. He also clothed the patriarch in his pontifical robes, and assigned the places of all those who had a right to be around him when seated on his throne, as the master of the ceremonies now does to the pope.

HIEROMNEMON, in Grecian antiquity, a delegate chosen by lot, and sent to the great council of the Amphictyons, to take care of what concerned religion. The hieromnemones were reckoned more honorable than the other members of that assembly, the general meetings of which were always summoned by them, and their names were prefixed to the decrees made by that council.

HIEROMNEMON was also the name of a stone used by the ancient Greeks in divination, but no description of it is extant.

HIER'OPHANT, n. s. Gr. $i\epsilon\rho\sigma\phi\dot{a}\nu\tau\eta\varsigma$. One who teaches rules of religion; a priest.

Herein the wantonness of poets, and the crafts of their heathenish pricets and hierophants, abundantly gratified the fancies of the people. Hale.

ILIEROPHANT, HIEROPHANTA, OF HIEROPHAN-TES, from ispog, holy, and pairw, I appear; a priest among the Athenians, who was properly the chief person that officiated in the eleusinia. This office was first executed by Eumolpus, and continued in his family for near 1200 years; though, when any person was appointed to this dignity, he was required always to live in celi-Apollodorus observes, that the hierobacy. phantes instructed persons initiated into their religion in the mysteries and duties thereof, and hence he derived his name: for the same reason he was called prophetes, the prophet. He had officers under him to assist him, who were also called prophetes, and exeges, i. e. explainers of divine things. They dressed and adorned the statues of the gods, and bore them in processions and solemn ceremonies.

HIEROPHYLAX, an officer in the Greek church, keeper of the holy utensils, vestments, &c.

HIERTING, or JETTING, a sea-port town of Denmark, in North Jutland, at the mouth of the Warde, with a good harbour: twenty-two miles north-west of Ripen. Long. 8° 22' E., lat. 55° 29' N.

Fast did they fly as them their feete could bear. High over hilles and lowly over dales.

Spenser. Faerie Queene.

They meet to hear and answer such high things. Shakspeare.

Boastful; ostentatious.

His forces, after all the high discourses, amounted really but to eighteen hundred foot. Clarendon.

Arrogant; proud; lofty.

The governor made himself merry with his high and threatening language, and sent him word he would neither give nor receive quarter. Clarendon.

Severe; oppressive.

When there appeareth on either side an high hand, violent prosecution, cunning advantages taken, and combination, then is the virtue of a judge seen.

Bacon.

Noble; illustrious.

Trust me, I am exceeding weary.

-I had thought weariness durst not have attacked so high blood-It doth me, though it discolours the complexion of my greatness to acknowledge it.

Shakspeare.

Violent; tempestous; loud. Applied to the wind.

More ships in calms on a deceitful coast. Or unseen rocks, than in high storms are lost.

Denham. Spiders cannot weave their nets in a high wind.

Duppa.

At length the winds are raised, the storm blows high ;

Be it your care, my friends, to keep it up

In its full fury. Addison's Cato. Tumultuous; turbulent; ungovernable. Not only tears

Rained at their eyes; but high winds worse within,

Began to rise ; high passions, anger,

Mistrust, suspicion, discord, hate, shook sore

Their inward state of mind. Milton,

Can heav'nly minds such high resentment show, Or exercise their spite in human woe? Dryden.

Full; complete: applied to time; now used only in cursory speech.

High time now 'gan it wax for Una fair,

To think of those her captive parents dear.

Faerie Queene.

Sweet warriour, when shall I have peace with you? High time it is this war now ended were. Spenser.

It was high time to do so, for it was now certain that forces were already upon their march towards the West. Clarendon.

It was high time for the lords to look about them. Id.

Raised to any great degree: as, a high pleasure; high luxury; a high performance; a high color.

Solomon lived at ease, and ful

Of honour, wealth, high fare. Milton. High sauces and spices are fetched from the Indies.

Baker.

Advancing in latitude from the line.

They are forced to take their course either high to the North, or low to the South. Abbot.

At the most perfect state; in the meridian : as, by the sun it is high noon : whence probably the foregoing expression, high time.

It is yet high day, neither is it time that the cattle Gen. xxix. 7. should be gathered.

Far advanced into antiquity.

The nominal observation of the several days of the

HIG'GLE, v. u. HIG'GLEDY-PIGGLEDY, adv. corruption of haggle. To be penurious; to sell provisions from door to door: the adverb is a cant word for confusedly.

In good offices and due retributions we may not be pinching and niggardly : it argues an ignoble mind, where we have wronged, to higgle and dodge in the amends. Hale.

Base thou art !

To higgle thus for a few blows, To gain thy knight an op'lent spouse. Hudibras.

Why all this higgling with thy friend about such a paltry sum? Does this become the generosity of the noble and rich John Bull? Arbuthnot.

HIGH, adj. Sax. peap, piz; Goth., Swed., and Teut. ha; Dan. hay.

Long upwards ; rising above from the surface, or from the centre: opposed to deep, or long downward.

Their Andes, or mountains, were far higher than those with us; whereby the remnants of the generation of men were, in such a particular deluge, saved. Bacon.

The higher parts of the earth being continually spending, and the lower continually gaining, they must of necessity at length come to an equality.

Burnet's Theory.

High o'er the rest by nature reared

In barbarous luxuriance grew. Beattie.

Elevated in place; raised aloft; opposed to low.

And we wol reuled ben at his devise

In highe and lowe : and thus by on assent,

We ben accorded to his judgment.

Chaucer. The Prologue to the Canterbury Tales.

No man, she sawe, and yet yshone the mone :

And hye upon a rocke she wenten sone

And sawe his barge ysailing in the se.

They that stand high have many blasts to shake

And, if they fall, they dash themselves to pieces. Shakspeare. Richard 111.

High o'er their heads a mould'ring rock is placed, That promises a fall, and shakes at ev'ry blast.

Dryden.

Reason elevates our thoughts as high as the stars, and leads us through the vast spaces of this mighty fabrick; yet it comes far short of the real extent of even corporeal being. Locke.

Exalted in nature.

The highest faculty of the soul. Baxter.

Elevated in rank or condition: as high priest. He wooes both high and low, both rich and poor. Shakspeare.

O mortals ! blind in fate, who never knew

To bear high fortune, or endure the low. Dryden. Exalted in sentiment.

Solomon lived at ease, nor aimed beyond

Higher design than to enjoy his state. Milton. Difficult; abstruse.

The god of love, ah, benedicite !

Howe mighty and howe gret a lord is he!

For he can maken of lowe hertes, hie,

And of hie lowe and lyke for to die ;

And harde hertes he can maken fre.

Chaucer. The Cuckowe and the Nightingale.

The oak's majestic boughs appeared Beneath a copse of various hue

Here the fat cook piles high the blazing fire,

And scarce the spit can turn the steer entire. Gay.

Id. Legende of Good Women.

them.

week is very high, and as old as the ancient Egyptians, who named the same according to the seven planets. Browne.

Dear; exorbitant in price.

If they must be good at so high a rate, they know they may be safe at a cheaper. South.

Capital; great; opposed to little: as, high treason, in opposition to petty.

HIGH, n. s. High place; elevation; superior region : only used with from and on.

Which when the king of gods beheld from high, He sighed. Druden.

On HIGH. Aloft; above; into superior regions.

Wide is the fronting gate, and raised on high, With adamantine columns threats the sky. Dryden.

HIGH is much used in composition with variety of meaning.

HI'GH-BLEST. Supremely happy.

The good which we enjoy from heaven descends ; But that from us ought should ascend to heaven, So prevalent, as to concern the mind Of God high-blest, or to incline his will, Milton.

Hard to belief may seem.

HI'GH-BLOWN. Swelled much with wind; much inflated.

I have ventured.

Like little wanton boys that swim on bladders, These many Summers on a sea of glory ; But far beyond my depth : my high-blown pride At length broke under me, and now has left me, Weary, and old with service, to the mercy Of a rude stream, that must for ever hide me.

Shakspeare. HI'GH-BORN. Of noble extraction.

Cast round your eyes Upon the high-born beauties of the court ; There chuse some worthy partner of your heart.

Rowe IHI'GH-BUILT, adj. Of lofty structure.

I know him by his stride,

The giant Harapha of Gath ; his look

Haughty as is his pile, high-built and proud. Milton. Covered with lofty buildings.

In dreadful wars

The high-built elephant his castle rears, Looks down on man below, and strikes the stars.

Creech. HIGH-CO'LORED. Having a deep or glaring color.

A fever in a rancid oily blood produces a scorbutic fever, with high-coloured urine, and spots in the skin. Floyer.

HI'GH-DESIGNING. Having great schemes. His warlike mind his soul devoid of fear,

His high-designing thoughts were figured there. Dryden.

IHI'GII-FED. Pampered.

A favourite mule, high-fed, and in the pride of flesh and mettle, would still be bragging of his family.

L'Estrange.

III'GH-FLAMING. Throwing the flame to a great height.

Hecatombs of bulls to Neptune slain,

High-fluming, please the monarch of the main. Pope.

HI'GH-FLIER, n. s. One that carries his opinions to extravagance.

She openly professeth herself to be a high-flier ; and it is not improbable she may also be a Papist at heart.

Swift.

HI'GH-FLOWN, adj. High and flown, from fly.

Elevated; proud.

This stiff necked pride nor art nor force can bend, Nor high-flown hopes to Reason's lure descend.

Denham.

Next brave Philotimus in post did ride :

Like rising ladders was his climbing mind ;

His high-flown thoughts had wings of courtly pride. Fletcher's Purple Island.

Turgid ; extravagant.

This fable is a high-flown hyperbole upon the miseries of marriage. L'Estrange.

HI'GH-FLYING. Extravagant in claims or opinions.

Clip the wings

Of their high-flying arbitrary kings.

Dryden's Virgil.

HI'GH-HEAPED, adj. Covered with high piles.

The plenteous board high-heaped with cates divine, And o'er the foaming bowl the laughing wine. Pope.

Raised into high piles.

I saw myself the vast unnumbered store

Of brass, high-heaped amidst the regal dome.

Pope.

HI'GH-HEELED. Having the heel of the shoe much raised.

By these embroidered high-heeled shees,

She shall be caught as in a noose. Swift.

HI'GH-HUNG. Hung aloft.

By the high-hung taper's light

I could discern his cheeks were glowing red.

Dryden. HI'GHLAND, n. s. High and land. Moun-

tainous region. Ladies in the highlands of Scotland use this discipline to their children in the Winter, and find that cold water does them no harm. Locke.

The wondering moon

Beholds her brother's steeds beneath her own; The highlands smoaked, cleft by the piercing rays. Addison.

HIGHLANDS OF SCOTLAND. See SCOTLAND.

HIGHLAND COUNTY, a county of the state of Ohio, United States, bounded south by Adam's county, east by Pike, north by Ross, Clinton, and Fayette, and west by Clermont. It is watered by Brush and Point creeks, and by the upper streams of the little Miami. Its surface is hilly, and the climate healthy, but it is thinly settled. Hillsborough is the chief town.

HI'GHLANDER, n. s. From highland. An inhabitant of mountains; mountaineer.

His cabinet council of highlanders. Addison.

HIGHLANDERS, a general appellation for the inhabitants of the mountainous parts of Scotland, to the north and north-west including those of the Hebrides. They are a branch of the ancient Celta, and are undoubtedly the descendants of the first inhabitants of Britain, as appears from the many monuments of their language, still retained in the most ancient names of places in all parts of the island. The Highlanders, or, as they are often termed by ancient authors, the Calcdonians, were always a brave, warlike, and hardy race of people; and, in the remotest times, seem to have possessed a degree of refinement in sentiments and manners then unknown to the other nations that surrounded them. This appears

not only from their own traditions and poems, but also from the testimony of many ancient authors. This civilisation was probably owing in a great measure to the order of the bards, or Druids, and some other institutions peculiar to this people. The ancient Highlanders lived by hunting alone, till some time after the era of Fingal, who was one of their kings towards the close of the third century. For some ages after that period, they turned their chief attention to the pastoral life, which afforded a less precarious subsistence. Till of late, agriculture in most parts of the Highlands made little progress. The Highlanders always had a king, and enjoyed a government of their own, till Kenneth II. having subdued the Pictish kingdom, in 845, transferred thither the seat of royalty. This event proved very unfavorable to the Highlands, which from this period began to decline. The country, no longer awed by the presence of the sovereign, fell into anarchy. The chieftains began to extend their authority, to form factions, and to foment divisions and feuds between contending clans. The laws were either too feeble to bind them, or too remote to take notice of them. Hence sprung all those evils which long disgraced the country, and disturbed the peace of its inhabitants. Robbery or plunder, provided it was committed on any one of an adverse clan, was countenanced : and their reprisals on one another were perpetual. Thus quarrels were handed down from one generation to another, and the whole clan was bound in honor to espouse the cause of every individual that belonged to it. The genius of the people was thus greatly altered; and the Highlanders of a few ages back were almost as remarkable for their irregular and disorderly way of life, as their predecessors had been for civilisation and virtue. But one of the strongest features that marked the character of the Highlanders, in every age, was their hospitality and benevolence to strangers. At night the traveller was always sure to find a hearty welcome in whatever house he should go to; and the host thought himself happier in giving the entertainment than the guest in receiving it. Even with regard to their enemies, the laws of hospitality were observed with the most sacred regard. They who fought against each other in the day, could join in the night feast, and even sleep together, in the same house. From the same principle, they were, in most cases, so faithful to their trust, that they rarely betrayed any confidence reposed in them. A promise they thought as binding as an oath, and held it equally inviolable and sacred. The Caledonians in all ages have been much addicted to poetry and music. The poems of Ossian, so universally repeated, and so highly esteemed by every Highlander, are a strong proof of the early proficiency of this people in the poetical art. The genius and character of the Gaelic poetry is well known. It is tender, simple, beautiful, and sublime. Among the ancient Highlanders, the harp was the chief instrument of music. It suited the mildness of their manners, and was well adapted to the peace and quiet which they enjoyed under their own kings. In a later period, however, when the constant quarrels of their chiefs, and

the endless fends of contending clans, turned all their thoughts to war, it was forced to give place to the bag-pipe, an instrument altogether of the martial kind, and therefore well suited to the state of the country at that time. Their dress consisted of a light woollen jacket, or tartan, woven in squares of various colors, in which red, green, blue, and black are most prevalent. The kilt is a short petticoat of the same stuff, reaching to the knees; and the hose, or short stockings, are woven in diamonds of red and white, tied under the knee with garters, often beautifully ornamented: the Highlanders have generally a pouch made of the skin of a badger. fox, or other animal, hanging before, in which they keep their tobacco and money, and this part of their dress is generally adorned with silver buttons and tassels; their plaid is also of tartan, consisting of twelve or thirteen yards of cloth, wrapped round them in a graceful manner, fastened round the middle by a belt, falling to the knees behind, and confined by a broach or silver pin to the top of the left shoulder: this is often their only cover, both within doors and when obliged to repose in the fields. The truis or trews, which are a sort of tartan pantaloons, are only worn by the gentry, instead of the kilt. Indeed, Sir John Sinclair contends, that the trews were the most ancient dress of the Highlanders, and that the kilt is of comparatively modern introduction. The Highlanders generally affected to have their dress of the color of the heath on which they reposed, probably from a principle of security in time of war, or that they might not be discovered while they lay in the heaths, waiting for their game. Their ancient arms were the broad sword and target, Lochaber axes, and a dirk, to which, before the act for disarming the Highlanders, in 1748, the pistol stuck into the girdle had been added. Always armed with a dirk and pistol, they were ready to resist an assault, or revenge a provocation, as soon as it was given. This circumstance contributed to render them polite and guarded in their behaviour to one another. When embodied by their chieftain, they were armed with a broad sword, a dagger; a target, a musket, and two pistols. In close engagement, and in broken ranks, they were irresistible. The only foe they dreaded was' cavalry.' As soon as the battle was over, most of the troops dispersed, and returned home to dispose of their plunder, and to provide for their families. Their religion was deeply tinctured with superstition. They believed in ghosts and apparitions ; by appearances in the heavens they predicted future events; they practised charms and incantations for the cure of various diseases; and to some individuals they thought the divinity had communicated a portion of his prescience. The language of the Highlanders is still the Gaelic; which, with many of their customs and manners, has been secured to them by their mountains and fastnesses, amidst the many revolutions which the rest of the island has undergone in so long a course of ages. That it has been formerly a good deal cultivated, appears from the style of its poems and tales, and from several ancient MSS. that have come down to the present times. To strangers the Gaelic has a forbidding aspect

on account of the number of its quiescent consonants (which are retained to mark the derivation of words and their variations in case and tense), but its sound is abundantly musical and harmonious, and its genius strong and masculine. See GAELIC. The Highlanders have begun of late years to apply to learning, agriculture, and especially to commerce, for which their country, every where indented with arms of the sea, is peculiarly favorable. Cattle are the chief staple of the country; but it produces more grain than would supply its inhabitants, if so much of it were not consumed in whisky. That article, however, is thought by physicians to be necessary for the health of the natives, when taken in moderation, on account of the coldness of the climate and the lowness of their diet. The Highlanders are beginning to avail themselves of their mines, woods, wool, and fisheries; and by a vigorous application, with due encouragement from government, may become a prosperous and useful people. They are active, persevering, in-dustrious, and economical. They are remarkably bold and adventurous, which qualifies them for being excellent seamen and soldiers. They are generally of a middle size, rather above it than otherwise; their eyes are lively, their features distinctly marked, and their persons strong and well made. Their countenances are open and ingenuous, and their tempers frank and communicative.

HIGH'LY, adv. From high.

With elevation as to place and situation; aloft.

In a great degree.

Whatever expedients can allay those heats, which break us into different factions, cannot but be useful to the public, and *highly* tend to its safety. Addison.

It cannot but be *highly* requisite for us to enliven our faith, by dwelling often on the same considerations. Atterbury.

Proudly; arrogantly; ambitiously.

What thou wouldst highly,

That thon wouldst holily; wouldst not play false, And yet wouldst wrongly win. Shakspeare.

With esteem; with estimation.

Every man that is among you, not to think of himself more *highly* than he ought to think.

Rom. xii.

HIGH-METTLED. Proud or ardeut of spirit.

He fails not in these to keep a stiff rein on a highmettled Pegasus; and takes care not to surfeit here, as he has done on other heads, by an erroneous abundance. Garth.

HIGH-MI'NDED. Proud; arrogant.

Because of unbelief they were broken off, and thou standest by faith : be not high-minded, but fear.

Rom. xi. 20.

My breast I'll burst with straining of my courage, But I will chastise this *high-minded* strumpet.

Shakspeare.

HIGHMORE (Joseph), esq., an eminent painter, born in London June 13th, 1692, the son of Mr. Edward Highmore, coal merchant. Having an early and strong inclination to painting, his father, wishing to gratify him, made a proposal to his uncle, who was serjeant painter to king

Vol. XI.

William III.; but, this failing, he was articled as clerk to an attorney in 1707; but so much against his inclination, that in three years he resolved to indulge his natural disposition to his favorite art; and employed his leisure hours in designing, and in studying geometry, perspective, architecture, and anatomy, without any instructors except books. By these exertions he soon arrived at such perfection in his favorite art, that he painted many pictures, which were not only valued highly in his own time, but are now the objects of admiration to painters. On the institution of the academy of painting, sculpture, &c., in London, in 1753, he was elected one of the professors. In 1754 he published in 4to. A Critical Examination of those two Paintings (by Rubens) on the ceiling of the Banqueting House at Whitehall, in which Architecture is introduced so far as relates to Perspective; together with the Discussion of a Question which has been the subject of Debate among Painters. In the solution of this question, he proved, that Rubens and other great painters were mistaken in the practice, and Mr. Kirby and several others in the theory; and in vol. XVH. of the Monthly Review, he animadverted (anonymously) on Mr. Kirby's unwarrantable treatment of Mr. Ware, and detected his errors, even when he exults in his own superior science. Mr. Highmore, in a practice of forty-six years, painted many portraits, of which several have been en-graved. In the historical branch, which was then much less cultivated than it is at present, we shall only mention Hagar and Ishmael, a present to the Foundling hospital: The good Samaritan: The finding of Moses, purchased at his sale by general Lister : The Ilarlowe Family, as described in Clarissa, now in the possession of T. W. Payler, esq.: Clarissa herself: The Graces unveiling Nature, drawn by memory from Rubens: The Clementina of Grandison, and the Queen Mother of Edward IV. with her younger son, &c., in Westminster Abbey; in the possession of his son. He was the author of various publications which were well received; but his most capital work was his Practice and Perspective, on the principles of Dr. Brook Taylor, &c., in 1 vol. 4to., 1763. This not only evinced his scientific knowledge of the subiect, but, by its perspicuity, removed the only objection that can be made to the system of Dr. Taylor. His Epistle to an Eminent Painter, published in the Gentleman's Magazine for 1778, shows that his talents were by no means impaired at the age of eighty-six. Indeed he retained them to the last, and had even strength and spirit sufficient to enable him to ride out daily on horseback the summer before he died. A strong constitution, habitual temperance, and constant attention to his health, in youth as well as in age, preserved his faculties to his eightyeighth year, when he died March 3rd, 1780. He was interred in Canterbury cathedral, leaving one son, Anthony, educated in his own profession. and a daughter. His tints, like those of Rubens and Vandyke, instead of being impaired, are improved by time. His idea of beauty, when he indulged his fancy, was of the highest kind; and his knowledge of perspective R

cave him great advantages in family pieces, of s ich he painted more than any one of his time. He could take a likeness by memory as well as y atting, as appears by his picture of the duke et Lorraine (afterwards emperor), which Faber raved; and those of king George II. (in Your assembly-room); queen Caroline, the two Gunnings, &c.

An irregular word. HI'GHMOST, adj. homest; topmost.

Now is the sun upon the highmost hill Shakspeare.

Of this day's journey.

HIGHNESS, n. s. From high.

Elevation above the surface; altitude; lofti-

The title of princes; anciently of kings.

14 nour is also cleped gret dignitee and highnesse. Chaucer. The Persones Tale.

Most royal majesty,

I crave no more than that your highness offered. Shakspeare.

How long in vain had nature strived to frame

A perfect princess, ere her highness came ? Waller. Beauty and greatness are eminently joined in your Dryden.

s wat highness. Your highness much mistakes me,

The first snake was a flatterer-I am none;

All for my deeds, I only sting when stung.

Byron. Deformed Transformed. Dignity of nature; supremacy.

De fruction from God was a terror to me, and by design of his highness I could not endure. Job xxxi.

HGH-PRINCIPLED. Extravagant in noon some of politics.

This seems to be the political creed of all the highipled men I have met with. Swift.

HIGH-RED. Deeply red.

Oil of turpentine, though clear as water, being lighted upon the purely white sugar of lead, has in a mort time afforded a high-red tincture. Boule.

IIIGH-SE'ASONED. Piquant to the palate. B. sparing also of salt in the seasoning of all his victorils, and use him not to high-seasoned meats.

Locke.

HIGH-SI'GHTED. Always looking upwards. Let high-sighted tyranny range on,

Till each man drop by lottery. Shakspeare.

HIGH-SPIR'ITED. Bold; daring; inso-

HIGH-STOM'ACHED. Obstinate; lofty. H 1'-stomached are they both, and full of ire ;

in rar, deaf as the sea, hasty as fire. Shakspeare.

RIGHT. This is an imperfect verb, used only in the preterite tense with a passive significatim: Sax. peran, to call; Gerin. hessen, to be Was named ; was called.

Ind whan the king that Yarbas hight it wist,

As he that had hire loved ever his life,

And wowed hire to haven to his wife,

5 ie sorow as he hath maked, and soche chere, I a routhe and pite for to here.

Chaucer. Legende of Good Women.

Two yonge knightes ligging by and by, Bothe in on armes wrought ful richely;

Of whiche two, Arcite highte that on,

And he that other highte Palamon.

Id. The Knightes Tale.

The city of the great king hight it well,

Wherein eternal peace and happiness doth dwell. Spenser.

Within this homestead lived, without a peer For crowing loud, the noble Chanticleer ; Dryden's Nun's Priest. So hight her cock.

242

It is sometimes used as a participle passive : called; named. It is now obsolete, except in burlesque writings.

Amongst the rest a good old woman was, Hubberd's Tale. Hight mother Hubberd. Pope. Hearn he hight.

HIGH-TAST'ED. Gustful; piquant.

Flattery still in sugared word betrays,

And poison in high-tasted meats conveys. Denham.

HIGH-VI'CED. Enormously wicked. Be as a planetary plague, when Jove Will o'er some high-viced city hang his poison

In the sick air. Shakspeare.

HIGH-WA'TER, n.s. High and water. The utmost flow of the tide.

They have a way of draining lands that lie below the high-water, and are something above the low-Mortimer. water mark.

HIGHWA'Y, n. s. High and way.

Great road; public path.

dictator.

So few there be

That chuse the narrow path, or seek the right : All keep the broad highway, and take delight

With many rather for to go astray. Faerie Qaeene. Two inscriptions give a great light to the histories of Appius, who made the highway, and of Fabius the

Addison.

Entering on a broad highway,

Where power and titles scattered lay,

He strove to pick up all he found. Swift.

Figuratively a train of action, with apparent consequence.

I could mention more trades we have lost, and are in the highway to lose. Child on Trade.

HI'GHWAYMAN, n. s. Highway and man. A robber that plunders on the public roads.

'Tis like the friendship of pickpockets and highwaymen, that observe strict justice among themselves.

Bentley.

A remedy like that of giving my money to an highwayman, before he attempts to take it by force, to prevent the sin of robbery. Swift.

HI'GH-WROUGHT. Accurately finished; nobly labored.

Thou triumphest, victor of the high-wrought day,

And the pleased dame, soft smiling, leadest away.

Pope.

IIIJAR (Duke de), a Spanish grandee, member of the modern Junta of Bayonne, and grand master of the ceremonies to king Joseph Buonaparte. He was of an ancient Castilian family, and born in 1775; during the life of his father he was known by the title of the duke d'Alliaga, and engaged in the study of literature and the fine arts. In 1808 he was summoned to Bayonne by the order of Napoleon; and, after the second abdication of king Charles, appointed to the office of master of the ceremonies to the new sovereign Joseph. He however abandoned the cause of the intruder as soon as the partizans of Ferdinand VII. took active measures to support his authority. Hence the duke was included in the list of Castilian nobles proscribed by the decree of Burgos; on which he retired to London, and remained there till the progress

of events had brought about the restoration of Ferdinand. He was then recalled to Madrid, and in 1814 appointed Spanish ambassador to France. He died in 1817, a short time after having received the order of the Golden Fleece.

HILARIA, in antiquity, feasts celebrated annually with great pomp and joy, by the Romans, on the 8th of the kalends of April, or 25th of March, in honor of Cybele. Every person dressed himself as he pleased, and took the badges of whatever dignity or quality he fancied. The statue of the goddess was carried in procession through the streets, accompanied by multitudes in the most splendid attire. The day before the festival was spent in mourning. Cybele represented the earth, which at this time of the year begins to feel the kindly warmth of the spring; so that this sudden transition from sorrow to joy was an emblem of the vicissitude of the seasons. The Romans took this feast originally from the Greeks, who called it avaßaoig q. d. ascensus; the eve of that day they spent in tears and lamentations, and thence denominated it karaßaous, descensus. Afterwards the Greeks took the name $i\lambda a \rho i a$ from the Romans; as appears from Photius, in his extract of the life of the philosopher Isidore. Casaubon maintains, that, beside this particular signification, the word was also a general name for any joyful or festival day, whether public, or private and domestic. But Salmasius does not allow of this. Tristan (tom. i. p. 482) distinguishes between hilaria and hilariæ. The former, according to him, were public rejoicings; and the latter prayers made in consequence thereof; or even of any private feast or rejoicing, as a marriage, &c. The public lasted several days; during which all mourning and funeral ceremonies were suspended.

IIILARION, the founder of the monastic life in Palestine, was born at Gaza, A. D. 291, of a pagan family, but embraced Christianity; and, having visited St. Anthony the anchoret in Egypt, followed his example, on returning to his own country, and obtained a great number of followers. He returned at last to the island of Cyprus, where he died in 371.

HILAR'ITY, n.s. Lat. hilaritas. Merriment; gaiety.

Averroes restrained his *hilarity*, and made no more thereof than Seneca commendeth, and was allowable in Cato; that is, a sober incalescence for wine.

Browne.

HILARIUS, an ancient father of the Christian church, who flourished in the fourth century. He was born, as St. Jerome informs us, at Poictiers, of a good family; who gave him a liberal education in the pagan religion. He was advanced to the bishopric of Poictiers A. D. 355, according to Baronius; and became a most zealous champion for the orthodox faith, particularly against the Arians, who were then gaining ground in France. He assembled several councils there, in which the determinations of the synods of Rimini and Seleucia were condemned. He wrote a treatise concerning synods; and a famous work in twelve books on the Trinity, which is much admired. He died in the end of the year 367. His works have been published; but the last

243

and best edition was given by the Benedictines at Paris in 1693.

IIILARIUSE (Joseph), an eminent antiquary, born at Enzesfeld, in Austria, in 1737. In 1751 he joined the Jesuits, and became eminent as a teacher of rhetoric and grammar in the college at Vienna, of which he was appointed præfectus rei nummariæ. To acquire a perfect knowledge of ancient coins, he visited Italy; and, in 1770, having renounced the vows of his order, he was appointed director of the imperial cabinet of ancient coins, and dean of philosophy and the fine arts. He was a man of a cheerful temper, extensive knowledge, and irreproachable morals. He died in 1798.

HILARODI, ancient poets among the Greeks, who went about singing songs, somewhat graver than the Ionic pieces, accompanied with some instrument. From the streets they were at last introduced into tragedy, as the magodi were into comedy. They appeared dressed in white, and were crowned with gold. At first they wore shoes; but afterwards they assumed the crepida, being only a sole tied over with a strap.

HILARY (Sr.), or St. HELIER, the chief town in the Isle of Jersey, having a very commodious harbour on the east side of St. Aubin's Bay, four miles east of St. Aubin's. The town consists of several good streets, and the courts of justice for the island are held here. In the centre of the town stands the court-house, a very stately structure, and near it the parish church, where the service is performed both in French and English. The harbour is defended by a strong castle, the residence of the governor; it is surrounded by deep trenches and strong walls, and the entrance is by a drawbridge secured by an iron gate. A workhouse and a public hospital have been erected here. Three gazettes are published here weekly in French, and one in English. There are three packets hence to Weymouth weekly, and regular traders to Southampon, and in summer there is a steam boat. On the top of a high rocky hill, near the town, was discovered, in the year 1785, a mass of stones ranged in a circular form, some perpendicular, and others lying horizontally on the former. It was called a Druidical temple, and was completely covered with earth at the time of discovery. General Conway, then governor, had the stones removed to Park Place, in Berkshire, where they were again erected and disposed in their original form.

HILLARY (ST.), a saint of the Roman Calendar, born at Arles in 401. He succeeded Honoratus as bishop of Arles, and presided in the council at Rome in 441. He wrote, 1. Homilies, under the name of Eusebius of Emessa. 2. The Life of St. Honoratus. 3. Opuscula. He died in 449, aged forty-eight.

HILDBURGHAUSEN, SAXE, a small duchy in the interior of Germany, bounded by Saxe-Meinungen and Saxe-Coburg; it contains a territorial extent of 217 square miles, and about 32,000 inhabitants. The soil is in general poor, particularly in the north, where it comprises a part of the forest of Thuringia; and there are few manufactures: but woollens, linen, thread, glass, dye-stuffs, salt, and vitriol, are exported in small quantities. The duke holds the fourth

 R_2

rank among the princes of the house of Saxe, and has a share of a vote in the smaller Germanic diet, and a full vote in the general assembly. His revenue is not more than £20,000: but his petty state has its assembly of nobles and town deputies, with an administration divided into the departments of justice, finance, education, police, public works, and the army ; the latter consisting of not more than 250 men. Appeals from the local magistrates go to the council of the duchy, afterwards to the court of justice at Jena. The duke, in common with other neighbouring princes, is interested in the University of that place.

HILDBURGHAUSEN, a town in the interior of Germany, the capital of the duchy of this name, is situated on the Wurra, and contains about 2500 inhabitants. It has a gymnasium, a seminary for school-masters, and some manufactures of cloth. The states of the duchy hold their meetings in the town-hall. It is seventeen miles south-east of Meinungen, and twenty north-west of Coburg.

HILDESHEIM, a province in the south of Hanover, lying between 51° 44' and 52° 25' of N. lat. and adjacent to the province of Gottingen. The superficial extent is estimated at 680 square miles, and the population at 130,000. The surface is uneven, particularly in the south, where it is intersected by the Hartz Mountains, and the soil is stony, but in the middle and north it is rich and productive.

This province is watered by the Innerste, the Oker, the Ecker, and the Fuse. The chief products are corn, flax, fruit, and hops : which, as well as cattle and wool, are objects of export. The prevailing religion is the Lutheran. The revenue is estimated at £90,000. Hildesheim was once an independent ecclesiastical state, the bishopric having been founded by Charlemagne. It had a succession of warlike bishops, one of whom having undertaken a contest, in 1519, against the dukes of Brunswick and Hanover, these princes procured a ban of the empire to be issued against him, and took possession of his estates, which they did not restore till 1643, after establishing here the Lutheran doctrines. The treaty of Westphalia placed the bishopric under the protection of Hanover, and thus it continued till 1802, when it was included among the territory given to the king of Prussia. After 1807 it formed a part of the kingdom of Westphalia, and in 1815 it was added by the congress of Vienna to the kingdom of Hanover. It has its own states, and is governed as an independent province, divided into fifteen bailiwies.

HILDESHEIM, a city of Hanover, the chief town of the principality of that name, is of considerable extent, containing 11,000 inhabitants. It was formerly fortified ; hut its walls have been demolished, and converted into public walks, and the whole place has an old and very irregular appearance. It stands on a declivity near the Innerste, which, dividing into two branches, forms a beautiful island, covered with gardens. The Old and New Towns have each their own magistrates, but in affairs affecting the general interest, they hold meetings in common. The council and the majority of the citizens are Lutherans: the bishop and a part of the inhabitants

Catholics. The large Gothic cathedral contains the Irminsaule, a celebrated monument of the aucient Saxons, supposed to have been the column which originally supported an image of Arminius, or Herman, the commander, who cut off the legions of Quintilius Varus, and was deified by the Saxons. This relic stands in the front of the grand choir, and supports a chandelier. The Catholics have ten other churches, the Lutherans eight. Here were formerly seven monasteries and collegiate chapters, which have been secularised. The episcopal palace, councilhouse, the arsenal, public stables, and the mint, are also worth notice. The chief employment of the inhabitants is brewing and the manufacture of yarn and linen. Twenty miles south-east of Hanover, and twenty west by south of Wolfenbuttel.

IHLDESLEY (Mark), bishop of Sodor and Man, was the son of Mark Hildesley, rector of Houghton, and born at Marston in Kent, in 1698. He was educated at Trinity College, Cambridge, and elected a fellow in 1723. In 1724 he was appointed Whitehall preacher; in 1731 vicar of Hitchin, and in 1735 rector of Holwell. He preached generally from memory, and his exemplary conduct in his vicarage and rectory not only gained him the character of a truly primitive priest, but recommended him to the duke of Athol, as the most proper successor to the worthy bishop Wilson, in the see of Sodor and Man; whose philanthropic design of printing a translation of the whole Bible in the Manks language, bishop Hildesley brought to a happy conclusion, after his consecration in 1755; and died within ten days of its publication, December 7th, 1772.

HIL'DING, n. s. Sax. bild, signifies a lord ; perhaps hilding means originally a little lord, in contempt, for a man that has only the delicacy or bad qualities of high rank; or a term of reproach abbreviated from hinderling, degenerate. -Johnson. A sorry paltry fellow: also used for a mean woman.

He was some hilding fellow, that had stolen

Shakspeare. The horse he rode on.

If your lordship find him not a hilding, hold me no Id. more in your respect.

A base slave, A hilding for a livery, a squire's cloth.

Id.

Laura, to his lady, was but a kitchen wench . Helen and Hero, hildings and harlots. Id.

This idle toy, this hilding, scorns my power, Rowe's Jane Shore. And sets us all at nought.

Sax. pill pyl; Goth. hol, HILL, n. s. HILLOCK, n. s. HILLOCK, n. s. HILLY, adj. Sax. bill byl; Goth. hol, haugel; Teut. hugel; Swed. hygel. An elevation of ground less than a mountain : hillock, a little hill : hilly, of unequal surface.

And, downward from an hill, under a bent

Ther stood the temple of Mars Armipotent. Chaucer. The Knightes Tale.

Three sides are sure embarred with erags and hills, The rest is easy, seant to rise espyed ; But mighty bulwarks fence the plainer part :

So art helps nature, nature strengtheneth art. Fairfax

Jerusalem is seated on two hills, Of height unlike, and turned side to side.

Id.

With other echo late I taught your shades

To answer, and resound far other song.

Id. Paradise Lost.

My sheep are thoughts, which I both guide and serve;

Their rasture is fair hills of fruitless love.

Sidney.

- Yet weigh this, alas! great is not great to the greater:
- What, judge ye, doth a *hillock* show by the lofty Olympus. *Id.*

Climbing to a hilly steep

He views his herds in vales afar. Dryden. Lo ! how the Norrick plains

Rise hilly, with large piles of slaughtered knights. Phillips.

Hilly countries afford the most entertaining prospects, though a man would chuse to travel through a plain one. Addison.

This mountain, and a few neighbouring hillocks that lie scattered about the bottom of it, is the whole circuit of these dominions. Id. on Italy.

When our eyes some prospect would pursue, Descending from a *hill*, looks round to view.

Granville.

A hill is nothing but the nest of some metal or mineral which, by a plastick virtue, and the efficacy of subterranean fires, converting the adjacent earths into their substance, do increase and grow. Cheyne.

The gentle shepherds on a hillock placed, Whose shady head a beechy garland crowned Viewed all their flocks that on the pastures grazed : Then down they sit, while Thenot gan the round. Fletcher's Purple Island.

Mine be the breezy hill that skirts the down, Where a green grassy turf is all I crave,

With here and there a violet bestrown,

Fast by a brook, or fountains murmuring wave; And many an evening sun shine sweetly on my grave. Beutlie.

The green hills

Are clothed with early blossoms.

Byron. Childe Hurold. Through every change the seven-hilled city hath

Retained her sway o'er nations.

Id. Deformed Transformed.

HILL (Aaron), a poet of considerable eminence, the son of a gentleman of Malmesbury Abbey in Wiltshire, was born in 1685. His father's imprudence having cut off his paternal inheritance, he left Westminster school at fourteen years of age, and embarked for Constantinople, to visit lord Paget the English ambassador there, who was his relation. Lord Paget received him with surprise and pleasure, provided him a tutor, and sent him to travel. He accordingly passed through Egypt, Palestine, and Turkey, and returning home with his noble patron, visited most of the courts of Europe. About 1709 he published his first poem, entitled Camillus, in honor of the earl of Peterborough,

who had been general in Spain; and being in the same year made master of Drury-lane theatre, he wrote his first tragedy, Elfred, or the Fair Inconstant. In 1710 he became master of the opera-house in the Hay-market; when he wrote an opera called Rinaldo, which met with great success, being the first that Handel set to music after he arrived in England. Unfortunately Mr. Hill was a projector as well as a poet, and in 1715 obtained a patent for extracting oil from beech-nuts; which undertaking miscarried after engaging three years of his attention. He was also concerned in the first attempt to settle the colony of Georgia, from which he never reaped any advantage. Mr. Hill seems to have lived in perfect harmony with all the writers of his time, except Pope, with whom he had a short paper war, occasioned by that gentleman's introducing him in the Dunciad, as one of the competitors for the prize offered by the goddess of Dulness, in the following lines :-

Then Hill essayed; scarce vanished out of sight, He buoys up instant, and returns to light; He bears no token of the sabler streams, And mounts far off among the swans of Thames.

This, though conveying an oblique compliment, roused Mr. Hill to take notice of it; which he did in a poem written during a journey to the north, entitled The Progress of Wit, a caveat for the use of an eminent writer: in the following lines Pope's too well-known disposition is elegantly, yet severely characterised :--

Tuneful Alexis on the Thames' fair side, The ladies' play-thing and the Muses' pride; With merit popular, with wit polite, Easy tho' vain, and elegant tho' light; Desiring and deserving others' praise, Poorly accepts a Fame he ne'er repays : Unborn to cherish, sneakingly approves; And wants the soul to spread the worth he loves,

Pope was very indignant at the 'sneakingly approves,' in the last couplet; and indeed through the whole controversy afterwards, in which it was generally thought that Hill had much the advantage, Pope seems rather to express his repentance by denying the offence, than to vindicate himself, supposing it to have been given. Mr. Hill, besides many other poems, wrote one, called The Northern Star, upon the actions of czar l'eter the Great; for which he was several years afterwards complimented with a gold medal from the empress Catharine I. according to the czar's desire. He likewise altered some of Shakspeare's plays, and translated some of Voltaire's. His last production was Merope, which was brought upon the stage in Drury-lane by Garrick. He died on the 8th of February, 1749, in the very minute of the earthquake; and, after his decease, four volumes of his works in prose and verse were published in 8vo., and his dramatic works in 2 vols.

HILL (Joseph), an English divine of the seventeenth century, born in Leeds, and educated at St. John's College, Cambridge. He became fellow of Magdalen College, whence he was ejected for non-conformity, in 1662. He became pastor of a congregation at Rotterdam, where he died in 1707. He published an enlarged edition of Schrevelius's Greek Lexicon.

in 1716. Having attended the botanical lectures of the Apothecary's Company, he soon made himself acquainted with the theoretical as well as practical parts of botany; and was employed by the duke of Richmond and lord Petre in the arrangement of their botanic gardens. Assisted by the liberality of these noblemen, he executed a scheme of travelling over the kingdom, to collect the most rare plants; which he afterwards published by subscription : but the profits of this undertaking did not answer his expectation. He next resorted to the stage, but, after a few unsuccessful attempts, it was found he had no pretensions to the sock or buskin; so he returned to his botanical pursuits, and his business as an apothecary. At length, about 1746, he tran-slated from the Greek, Theophrastus's Tract on Gems, which he published by subscription ; and which, being well executed, procured him friends, reputation, and money. Encouraged by this, he engaged in works of greater extent and importance. The first was A general Natural History, in 3 vols. folio. He next engaged with George Lewis Scott, esq., in furnishing a Supplement to Chambers's Dictionary. He at the same time started the British Magazine; and while he was engaged in a great number of these and other works, some of which seemed to require the continued attention of a whole life, he carried on a daily essay, under the title of the Inspector. Amidst this hurry of business, Mr. Hill was so laborious and ready in all his undertakings, and was withal so exact an economist of his time, that he scarcely ever missed a public amusement for many years: where, while he relaxed from the severer pursuits of study, he gleaned up articles for his periodical works. It would not be easy to trace Dr. Hill (for he had now procured a diploma from the university of St. Andrew's) through all his various pursuits. Being refused admission as a member of the Royal Society, he ridiculed that learned body in A Review of the Works of the Royal Society of London, 4to. 1751. This, together with his over-writing himself upon all subjects without reserve, made him sink in the estimation of the public. He found, as usual, however, resources in his own invention. He applied himself to the preparation of certain simple medicines; such as the essence of water-dock, tincture of valerian, balsam of honey, &c. The well-known simplicity of these medicines made the public judge favorably of their effects, so that they had a rapid sale. Soon after the publication of the first of these medicines he obtained the patronage of the earl of Bute, through whose interest he acquired the management of the royal gardens at Kew, with a handsome salary : and to wind up the whole of an extraordinary life, having, a little before his death, seized an opportunity to introduce himself to the knowledge of the king of Sweden, that monarch invested him with one of the orders of his court. Garrick thus characterised Hill :--

For physic and farces his rival there scarce is; His farces are physic, his physic a farce is.

He died in 1775

IIILLAH, or IIELLAH, a considerable town of Asiatic Turkey, in the province of Irak-Arabi, or pachalic of Bagdad. It is about sixty miles to the south of Bagdad, on the western bank of the Euphrates, on the borders of the great Syrian desert; and is remarkable as standing in the vicinity of the ruins of BABYLON, which see.

The town has an extensive and well-regulated bazaar, several excellent caravanseras built of Babylonian brick, and is in general well-built. It is governed by a hakeem, appointed by the pasha of Bagdad. A quarter of the town, situated on the eastern bank, is connected with the other by a bridge of boats. The soil in the vicinity is fertile, but much neglected. The Euphrates widens as it approaches this place, where it is about 200 paces wide, and in spring about forty feet deep. The tides of the Persian Gulph are felt twenty or twenty-five miles above Korna; and flat-bottomed boats, not exceeding fifty tons burden, can pass up to Hillah about six months in the year. During the other six months the marshes of Lemloon entirely obstruct the passage.

HILLEL (senior), of Babylon, president of the sanhedrim of Jerusalem. He formed a celebrated school there, in which he maintained the oral traditions of the Jews against Shammai, his colleague, whose disciples adhered only to the written law; and this controversy gave rise to the sects of Pharisees and Sadducees. He was likewise one of the compilers of the Talmud. He also labored much to give a correct edition of the sacred text; and there is attributed to him an ancient MS. Bible, which bears his name. He flourished about A. A. C. 30, and died in a very advanced age.

HILLEL, the nasi, or prince, another learned Jew, the grandson of Judas Hakkadosh, or the Saint, the author of the Mishna, lived in the fourth century. He composed a cycle; and was one of the principal doctors of the Gemara. The greatest number of the Jewish writers attribute to him the correct edition of the Hebrew text which bears the name of Hillel, mentioned above. There have been several other Jewish writers of the same name.

HILLIA, in botany, a genus of the monogynia order, and hexandria class of plants: cAL. hexaphyllous: cor. cleft in six parts, and very long; the berry inferior, bilocular, and polyspermous.

HILLSBOROUGH, a borough, fair, and posttown of Ireland, in the county of Down, Ulster, sixty-nine miles from Dublin. The earl of Hillsborough has a fine seat here. The town is pleasantly situated and well-built, in view of Lisburn, Belfast, and Carrickfergus Bay; the church is magnificent, having an elegant spire, as lofty as that of St. Patrick's in Dublin, and seven painted windows. There is an excellent inn here, and a thriving manufacture of muslins. It has three fairs, and sent two members to the Irish parliament before the Union.

HILLSBOROUGH, CAPE, a cape on the northeast coast of New Holland, in long. 148° 44' E., lat. 20° 56' S.

Hillsborough, a county of New Hampshire, United States, bounded north by Grafton county, south by the state of Massachusetts, west by Cheshire, and east by Rockingham county. Its population are all free, and follow agriculture as their chief employment. The chief towns are Amherst and Hopk inton.

HILLSBOROUGH, one of the middle districts of North Carolina, bounded north by the state of Virginia, south by Fayetteville district, east by Halifax, and west by Salisbury.

HILT, n.s. Sax. plt, from bealvan, to hold. The handle of any thing, particularly of a sword.

Now sits expectation in the air,

And hides a sword from hilt unto the point

With crowns imperial; crowns and coronets. Shakspeare.

Take thou the hilt,

And, when my face is covered as 'tis now,

Guide thou the sword. Id. Julius Cæsar. Be his this sword, whose blade of brass displays

A ruddy gleam ; whose hilt, a silver blaze Pope. IIIM. Saxon, þim.

Me he restored unto my office, and him he hanged. Gen. xli

His wallet lay before him, in his lappe, Chaucer. Prologue to the Cant. Tales.

But Juan saw not this : each wreath of smoke Appeared to *kim* but as the magic vapour

Of some alchymic furnace, from whence broke The wealth of worlds, a wealth of tax and paper.

Byron.

The fifth, who, by a Christian mother nourished, Had been neglected, ill-used, and what not, Because deformed, yet died all game and bottom To save a sire who blushed that he begot him. Id.

IIim was anciently used for it in a neutral sense.

The subjunctive mood hath evermore some conjunction joined with him. Accidence.

The HIMALAYA, HIMALEH, OF HIMACTAL (literally the Snowy) MOUNTAINS, is the name, sufficiently appropriate, of a vast range of mountains separating India from Thibet, or Lesser Tartary. It is in fact the highest part of the Imaus, or Emodus range of ancient writers, and extends from the defile of the Sutuleje near Cashmere, to that of the Bramapootra, being in length from north-west to south-east nearly 1000 British miles; the western extremity is in lat. -32°, and long. 77°; the eastern in lat. 24°, and long. 95°. The length of this stupendous range is various. Every account we receive of a passage through them gives a detail of many days' journey, through deserts of snow and rocks; and it is to be inferred, that on the north-east, as well as the Hindostan side, they advance to, and retreat from the low ground in an equally irregular manner. Some accounts indeed would induce the belief, that long ranges, crowned with snow-clad peaks, project in various places from the great spire, and include habitable and milder districts; for, in all the routes of which we have accounts, hills covered with snow are occasionally mentioned as occurring, even after the great deserts are passed, and the grazing country entered. The breadth, then, of this crest of snow-clad rock itself cannot fairly be estimated at less than from seventy to eighty miles. The great snowy belt, although its loftiest crest is broken into numberless cliffs and ravines, never-

theless presents a barrier perfectly impracticable, except in those places where hollows that become the beds of rivers have in some degree in e sected it, and facilitated approach to its mole remote recesses. Few rivers hold their come wholly through it; indeed, in the upper part, the Sutuleje alone has been traced across the rocky barrier, and there is a path aloge its stream, from different parts of which diverge, that lead in various directions through the mountains. No reasonable doubt can move exist of the very long and extraordinary comments which that river takes. The routes given loos will trace it particularly, nearly to its @ Several other passes through the Himalaya ex-1.1 the south-eastward; but Europeans are uponquainted with all of them beyond have been between which and that of the Sut deja dor passes of Joar, Darma, Nitteemana, Lamanitor Gurooneettee, and Birjee, are found practical for the conveyance of goods.

Beside these chief passes, there are other more danger and difficulty that pervade the snowy range in various directions, finding outer to the milder countries beyond. Such is the pass near the source of the river J'pannevie, the from Bhurassoo to the neighbouring district China; a path also said to exist near he ...nauth, &c. &c. These are all so danger and toilsome, that few but the wildest inhall tants of the most inhospitable regions choose to invade their deserts of eternal rock and sho where no living thing is seen, and no means m. to be obtained for long preserving life. To me westward of the Sutuleje the passes are perh. more frequent, certainly less difficult. The of Cooloo through Stanpore, by Luckton Gara and Ludhak, and that through Chu: et by Joocela, Mookhee, and Htoorpore, are the best and most frequented. With those v may exist farther to the westward hat we Chambee and Cashmire, we are unacquired but it is well known that a comparative y and much frequented road is found frequented Punjab to Cashmire, and through that vella lo Ludhak, and the other states and districts of Thibet. We are also unacquainted, even by unor mation, with the actual course through the mile to Cashmire, but it doubtless leads along the river Jy, thure, which arises in the hills boundary that valley to the north-east and east.

The limit of perpetual congelation in the Himalaya Mountains has been a matter of controversy. A writer in the Quarterly P has asserted that this height is below 11,0° above the sea, and has maintained that the of the range itself will be found much inferthat of the Andes. Captain Webb, from 1000 ous heights taken with the barometer, has the a very different conclusion.

⁴Near the temple of Milum,' says Mr. F ⁴ elevated 11,405 feet, there were large here of or rye, and buckwheat; and, at an eleof about 13,000 feet, he procured some pl spikenard. On the 21st of June, Captain V camp was 11,680 feet above Calcutta. ⁴ face was covered with rich vegetation as the the knee, very extensive beds of strawb full flower, and plenty of currant-bu blossom all around, in a clear spot of rich black mould soil, surrounded by a noble forest of pine, oak, and rhododendron. On the 22d of June he reached the top of Pilgoenta-Churhaee, 12,642 feet above Calcutta: there was not the smallest patch of snow near him, and the surface was covered with strawberry plants, butter-cups, dandelion, and a profusion of other flowers. The shoulders of the hill above him, about 450 feet more elevated, were covered with the same to the top, and about 500 feet below was a forest of pine, rhododendron, and birch. These facts lead Captain Webb to infer that the inferior limit of perpetual congelation in the Himalaya Mountains, is beyond 13,500 feet, at least, above the level of Calcutta.'

These conclusions of captain Webb receive much support from the following observations of Mr. Fraser.

'On the night of the 16th we slept at Bheemkeudar, near the source of the Coonoo and Bheem streams. There is no wood near this place, even in the very bottom of the valley, and we had left even the stunted birch at a considerable distance below; but there was a profusion of flowers, ferns, thistles, &c., and luxuriant pasturage. Captain Webb's limit of wood is at least as high as 12,000 to 12,300 feet. I would therefore presume the site of Bheemkeudar to be considerably above that level, say 13,000 to 13,300 feet above Calcutta. From thence we ascended at first rather gradually, and then very rapidly, till we left all luxuriant vegetation, and entered the region of striped and scattered, and partially melting snow, for nearly two miles of the perambulator. From calculating the distance passed, and adverting to the elevation we had attained, I would presume that this was at least 1500 feet above Bheemkeudar, or from 14,500 to 15,000 feet above Calcutta.

'We proceeded onwards, ascending very rapidly, while vegetation decreased gradually to a mere green moss, with here and there a few snow-flowers starting through it; snow fast increasing, till at length we entered on what I presume was the perennial and unmelting snow, entirely beyond the line of vegetation, where the rock was bare even of lichens.' p. 327.

From these and other facts, which Mr. Fraser details, he considers the line of perpetual congelation as between 15,000 and 16,000 feet above Calcutta. In the Rol or Shatul pass, the seeds of a species of campanula were gathered at the height of 16,800 feet above the level of the sea, at a spot where the thermometer at noon, in the middle of October, stood at 27° of Fahrenheit. Shruhs were found in a vegetating state at a still greater altitude.

The spot which obtains the name of Jumnotree, or the source of the Jumna, is very little below the place where the various small streams, formed on the mountain's brow by the melting of many masses of snow, unite in one, and fall into

a basin below. To this basin, however, there is no access; for, immediately above this spot, the rocks again close over the stream, and, though not so lofty as those below, they interpose a complete bar to further progress in the bed of the torrent. A mass of snow, too, had fallen from above at the farther extremity of this pass, under which the river runs. Between the two banks the view is closed by the breast of the mountain, which is of vivid green, from perpetual moisture, and is furrowed by time and the torrents into numberless ravines, and down these ravines are seen trickling the numerous sources of this branch of the Jumna. Above this green bank, rugged, bare, and dark rocky cliffs arise, and the deep calm beds and cliffs of snow, towering above all, finish the picture. Noble rocks of varied hues and forms, crowned with luxuriant dark foliage, and the stream foaming from rock to rock, form a foreground not unworthy of it.

At the place where it is customary to perform ablution,' says Mr. Fraser, 'the rock on the north-east side of the river is very steep. Between the lamma of this rock, which appears to be quartzose, run several small streams of warm water, forming together a considerable quantity. There are several other sources; and one in particular, from which springs a column of very considerable size, is situated in the bed of the river between two large stones, and over it falls a stream of the river water. This water is hotter than that already noticed; the hand cannot bear to be kept a moment in it, and it emits much vapor. These warm springs are of great sanctity; and the spot for bathing is at that point before mentioned, where one of a considerable size rises 1.1 a pool of the cold river water, and renders it milk warm. This jet is both heard and seen as it plays under the surface of the pool. Here all the people bathed, while the pundit said prayers, and received his dues; and here also I bathed, was prayed over, and submitted to be marked by the sacred mud of the hot springs on the forehead like the rest, and of course was obliged to make my present to the priest for his ministry.'-Page 429. In this range is also found Gungootree, the source of the GANGES (see that article); the Brahmapootra and the Indus.

The superior altitude of the Himalaya range to the mountains of the Andes has been established beyond a doubt, by the survey of captain Blake. The following are altitudes deduced from his observations, by Mr. Colebrooke :---

	Altitude in feet
	above the sea.
Peak without name	. 21,935
Chandragiri, or Mountain of	the 2 23 007
Moon	\$ 20,007
Peak without name	. 24,108
Swelagar or Nepal	. 25,261
Dhwalagiri, or Ghasu Coti, or	the 28,015
White Mountain	\$ 20,015

The following is a Corrected TABLE of the HEIGHTS of the Principal Snowy Peaks of the HIMALAYA MOUNTAINS.

, The letters refer to Captain Hodgson's Tables attached to his Official Survey.

HIMERA, in ancient geography, the name of two rivers in Sicily, viz.

HIMERA running into the Tuscan Sea, and now called Fiume di Termini; and another runs into the Libyan Sea, dividing Sicily into two parts, being the boundary between the Syracusians to the east, and Carthaginians to the west. These rivers rise from different springs.

HIMERA, an ancient town of Sicily, at the mouth of the Himera, on its left, or west side. It was a colony of Zancle, and afterwards destroyed by the Carthaginians.

HIMERÉNSES THERMÆ, in ancient geography, a town of Sicily. After the destruction of the town of Himera, by the Carthaginians, such of the inhabitants as remained settled in the same territory, near the ancient town, now called Termini. It was made a Roman colony by Augustus. HIMSELF, pron. Him and self.

In the nominative the same as he, only more emphatical, and more expressive of individual personality.

It was a sparing speech of the ancients to say, that a friend is another *himself*; for that a friend is far more than *himself*. Bacon.

With shame remembers, while *himself* was one Of the same herd, *himself* the same had done.

Denham.

Her eyes, her lips, her cheeks, her shapes, her features,

Seem to be drawn by love's own hand ; by love Himself in love. Dryden.

It is added to a personal pronoun or noun, by way of emphatical discrimination.

He himself returned again. Judges.

God himself is with us for our captain. Chron.

And he himself was swete as is the rote Of Acoris or any Setewale.

The Milleres Tale. Chaucer. In ancient authors it is used reutrally for itself.

She is advanced

Above the clouds as high as Heaven himself.

Shakspeare. In the oblique cases it has a reciprocal signification.

David hid himself in the field. Samuel.

It is sometimes not reciprocal.

I perceive it was not altogether your brother's evil disposition made him seek his death; but a provoking merit set a work by a reproveable badness in himself. Shakspeare.

Nothing in nature can so peculiarly gratify the noble dispositions of humanity, as for one man to see another so much *himself* as to sigh his griefs, and groan his pains, to sing his joys, and do and feel every thing by sympathy. South.

By HIMSELF. Alone; unaccompanied.

Ahab went one way by himself, and Obadiah went another way by himself. Kings.

He thoughte wel that every man Wol helpe himself in love, if that he can ; And, eke deliver himself out of prison.

Chaucer. The Knightes Tale. Each on himself relied,

As only in his arm the moment lay Of victory. Milton.

But when by shame constrained to go on board, He heard how the wild cannon nearer roared, And saw himself confined like sheep in pen;

Daniel then thought he was in lyon's den. Marvell. Some write, confined by physick ; some by debt ; Some, for 'tis Sunday; some because 'tis wet.

Another writes because his father writ,

And proves himself a bastard by his wit. Young. HIN, n.s. Heb. הן. A measure of liquids among Jews, containing about ten pints.

With the one lamb a tenth deal of flour, mingled with the fourth part of an hin of beaten oil.

Erod. xxix, 40.

HINCKLEY, a town of Leicestershire, with a market on Monday. It has a large handsome church, with a lofty spire; and a considerable stocking manufactory. It is twelve miles south-west of Leicester, and ninety-one N.N.W. of London

HINCMAR, or HINCMARUS, archbishop of Rheims, A. D. 845, was a zealous defender of the liberties of the Gallican church, but was obliged to fly from Rheims when the Normans invaded that province. He died at Epernay in 882. His works were printed in 1645, in 2 vols. folio.

111ND, n.s. The female of the red deer: a servant: a peasant or rustic.

Canst thou mark when the hinds do calve? Job.

And many an hart and many an hinde,

Was both before me and behinde.

Chaucer. Boke of the Duchesse. The n'as baillif, ne herde, ne hine,

That he ne knew his sleight and his covine.

Id. Prologue to the Cant. Tales. How he slew, with glancing dart amiss,

A gentle hind, the which the lovely boy

Did love as life.

Faerie Queene. A couple of Ford's knaves, his hinds, were called forth by their mistress, to carry me in the name of foul cloaths to Datchet-lane. Shakspeare.

The Dutch, who came like greedy hinds before, To reap the harvest their ripe years did yield, Now look like those, when rolling thunders roar, And sheets of lightning blast the standing field.

Dryden.

Nor Hercules more lands or labours knew, Not though the brazen-footed hind he slew. Id.

He cloathed himself in coarse array, A laboring hind in shew. Id. Fubles.

Fearful as is the hare or hunted hind,

Her face and breast she oft with crosses signed ; No customs would she break or change her settled mind. Fletcher's Purple Island.

HIND, adj.
HIN'DER, v. a., v. n., & adj.
HIN'DERANCE, n. s.
HIN'DERER, n. s.
HIN'DERING, part.
HIN'DERLING, n. s.
HIN'DERMOST, adj.
HIND'MOST, adj.

Adjec. compar. hinder; superlat. hindmost. Saxon, bynban. Backward ; contrary in position to the face; as hind legs. Sax.

bineman, bine, binopian. The word hinder signifies to prevent, as by going behind, and pulling a person back; to raise impediments; to obstruct: hinder, the position contrary to the face. Ilinderling, a worthless degenerate animal : hindermost, or more properly hindmost, the last; that which comes in the rear: hinderance, an impediment, is used with the particles of and to before the thing hindered, with to before the person.

Hinder me not, seeing the Lord hath prospered my Gen. xxiv. 56.

He put the handmaids and their children foremost, and Leah and her children after, and Rachel and Joseph hindermost. Genesis.

He met thee by the way, and smote the hindmost of thee, even all that were feeble behind. Deut. xxv.

The whole world shined with clear light, and none were hindered in their labour. Wisd. xvii. 20.

Full many a worthie man, and wise,

Han hindered and idoen to die

These losingeous with her flatterie.

Chaucer. Romaunt of the Rose, Tucked he was, as is a frere, aboute ;

And ever he rode the hinderest of the route.

Id. Prologue to the Cant. Tales. False opinions, touching the will of God to have things done, are wont to bring forth mighty and violent practices against the hinderances of them, and those practices new opinions, more pernicicus than the first; yea, most extremely sometimes opposite to the Hooker.

They must be in every Christian church the same, except mere impossibility of so having it be the hinderance. Id.

Like to an entered tide they all rush by,

And leave you hindermost. Shakspeare. You minimus of hindering knot-grass made ! Id.

"Tis not his wont to be the hindmost man,

Whate'er occasion keeps us from him now. Id. Brakes, great hinderers of all plowing, grow. May.

If the alms were hindered only by entreaty, the hinderer is not tied to restitution, because entreaty took not liberty away from the giver. Tuylor.

Bears, fighting with any man, stand upon their hinder feet, and so this did, being ready to give me a shrewd embracement. Sidney.

Solitude damps thought and wit; too much company dissipates and hinders it from fixing. Temple.

What hinderance have they been to the knowledge Dryden. of what is well done?

Id.

Have we not plighted each our holy oath, One soul should both inspire, and neither prove His fellow's *hinderance* in pursuit of love? Id.

Let him retire, betwixt two ages cast, The first of this and *hindmost* of the last, A losing gamester.

This objection hinders not but that the heroick action of some commander, enterprised for the Christian cause, and executed happily, may be written. Id.

What hinders younger brothers, ocing fathers of families, from having the same right. Locke.

As the hinder feet of the horse stuck to the mountain, while the body reared up in the air, the poet with great difficulty kept himself from sliding off his back. Addison.

He must conquer all these difficulties, and remove all these hinderances out of the way that leads to justice. Atterbury. The stag

Hears his own feet, and thinks they sound like more, And fears his hind legs will o'ertake his fore. Pope.

The race by vigor, not by vaunts, is won; So take the *hindmost*, hell-he said, and run.

HINDBERRIES, n.s. The same as raspberries,—Ainsworth.

IIINDOSTAN (from Pers. Hindoo, black, and stan, place), the place or country of the Blacks, called by the aboriginal inhabitants Bahrat, or Bahrat Kind, the dominions of Bahrat, is a region of Asia, occupying from about the eighth to the thirty-fifth degree of north latitude, and from the sixty-eighth to the ninety-second degree of east longitude. Its general boundaries on every side but the east are well defined ; and are, northward, the great Himalaya range, the Indus west; the Indian Ocean and the Bay of Bengal south; and the eastern hills and forests of Tipperah and Chittagong east. Excepting in Bootan, the primitive religion of BRAHMA (which see) every where prevails; nor is it to be found beyond these limits, except in Assam and The length, from north to south, is Cassay. nearly 1900 miles. Its greatest breadth is about 1500 miles. In estimating the area, the southern triangle is found to contain about 710,000 square miles, and the northern one 570,000, so that the whole surface comprises 1,280,000 square miles. Taking the population at 100,000,000, the number of individuals to a square mile will be seventy-eight.

The following is an ABSTRACT of the present STATE OF HINDOSTAN and its RULING POWERS: dis^{*} tinguishing the extent of their respective Territories, and the number of the Inhabitants.

Id.

	Geographical Square Milcs.	Population.
I. BRITISH POSSESSIONS. Bengal, Bahar, and Benares	162,000 60,000	29,000,000 10,000,000
Under the Bengal Presidency	222,000 125,000 10,000	39,000,000 12,000,000 2,500,000
Total of British Hindostan .	357,000	53,500,000
II. BRITISH ALLIES AND TRIBUTARIES. The Nizam	76,000 53,000 13,000 22,000 5,000 526,000 75,000 58,000 63,000 54,000	8,000,000 5,000,000 2,000,000 500,000 71,000,000 6,000,000 3,000,000 2,000,000 4,000,000
Under the Rajahs of Joudpoor, Jyenagur, Odey- poor, and other Rajpoot Chiefs; the Ameers of Sinde, the Cabul government, and Chief of Cashmere; the Rajahs of Bootan, Assam, and innumerable Goand, Coolee, and other petty Native Chiefs	776,000 244,000	86,000,000 15,000,000
Total of Hindostan .	1,020,000	101,000,000

This region is divided by its great natural features into Northern Hindostan, Hindostan Proper, the Deccan, and the South of India.

1. Northern Hindostan comprehends Cashmere on the west, and Bootan on the east, with the intermediate mountainous provinces, situated between the first range that rises from the plains on the northern frontiers of Delhi, Oude, Bahar, and Bengal, and the lofty Himalaya ridge bordering on Thibet. The whole tract last-mentioned is subject to the Ghoorkhali state of Nepaul, and has been but little explored. The appellations by which the districts are most commonly known are, Serinagur, or Gerwal, Badrycazrama, Kemaoon, Jemlah, the twenty-four Rajahs, Lamjungh, Goreah, Nepaul, Mocwanpoor, Morung, and Kyraut. The inhabitants of this wild country have never been permanently subdued or envilised by any of the various masters of India.

2. Hindostan Proper contains the eleven large soubahs, or provinces, originally formed by the emperor Acbar, and is bounded on the south by the Nerbuddah River, and the Deccan. The names of its provinces are Lahore, Mooltan, including Sinde, Gujiat, Ajmeer, Delhi, Agra, Malwah, Allahabad, Oude, Bahar, and Bengal. This is considered the most civilised and richest part of Hindostan, and contained the seats of its most famous empires, both Hindoo and Mahommedan. The inhabitants also (Bengal excepted) may be considered as a superior race, both physically and intellectually, to the population of the other divisions.

3. The Deccan is bounded on the north by the course of the Nerbuddah River, and from its source by an imaginary line extending in the same parallel of latitude to the mouth of the Hooghly. To the south its boundaries are the Krishna and Malpurba rivers. Within this space are comprehended Aurungabad, Khandesh, Beder, Hyderabad, Nandere, the Northern Circars, Berar, Gundwana, Orissa, and great part of Bejapoor. Having been invaded at a much later period than Hindostan Proper, it contains a much greater proportion of Hindoo inhabitants.

4. The South of India has the figure of a triangle, of which its northern boundary, the river Krishna, is the base, and the coasts of Coromandel and Malabar the sides. The provinces herein comprehended are a small part of Bejapoor, the Balaghaut ceded districts, the Carnatic Northern, Central, and Southern; Mysore, Canara, Malabar, Barramahal, Coimbetoor, Dindigul, Salem, and Kistnagherry, Cochin, and Travancor. In this division of Hindostan the Mahommedans did not obtain a footing until a very recent period, and some part was never subdued by them.

The whole of Hindostan is watered by noble rivers, most of which have retained their ancient appellations. The principal in point of magnitude are the Brahmapootra, the Ganges, the Indus, the Sutuleje, the Krishna, the Godavery, the Jumna, the Nerbuddah, the Cavery, the Goggrah, the Tuptee, the Mahanuddy, the Megna, the Soane, the Chumbul, the Beyah, the Gunduck, and the Ravey.

Its most remarkable mountains are the great Himalaya ridge on the north, the hills of Kemaoon and Sewalic, the Eastern and Western Ghauts, and the Vindhyan chain of mountains, which cross it nearly parallel to the course of the Nerbuddah, and pass through the provinces of Bahar and Benares.

The chief cities and towns are all now possessed by the British. The three largest and most populous are Surat, Benares, and Calcutta; the next in rank are Delhi, Madras, Bombay, Agra, Lucknow, Patna, Moorshedabad, Dacca, Poona, Hyderabad in the Deccan, Nagpoor, Catmandoo, Oojain, Jyenagur, Amritsir, Lahore, and Seringapatam.

As each of the more important divisions of Hindostan obtains our particular attention, in its alphabetical place, a few remarks on some common features of this interesting region are all that can be necessary in this place.

The climate here varies of course with the latitude, but still more with the relative height of places. Though often considered otherwise, it appears in point of fact to be as healthy as any other region of the world of the same extent. Its hottest parts are the Northern Circars, and the sandy plains through which the Indus flows. Dr. Roxburgh, speaking of the land breezes of Coromandel, says :-- ' Should the sea-breeze fail, as sometimes happens, the land wind decreases gradually until it dies away in the beginning of the night, which, on account of its calmness, is dismal to a degree; next morning a little motion of the air is again perceptible; but, at the usual time, the wind sets in as strong and as hot as before. Every thing we put our hands upon is distressing to the touch, which must be the case when the temperature of the body is inferior to that of the atmosphere. This we experienced for almost a fortnight in the year 1799, in the Northern Circars, when the thermometer at eight o'clock at night stood at 108°, and at noon at 112°. Shades, globe-lamps, and tumblers, then very often crack and break to pieces, and the wooden furniture warps and shrinks so much that even the nails fall out of the doors, tables, &c. In their greatest intensity, however, I have never seen the thermometer rise higher than 115°, viz. in the coolest part of the house; though some say they have observed it at 130°.

It is in this district that the noxious state of the air, in the season of vegetation, creates what is called the hill fever; supposed to arise from the union of putrid vegetable exhalations with the fog so constantly prevailing : and here the bamboos frequently take fire in the hot season from their own friction in the wind. Even the native tribes cannot bear long exposure to these hot winds, and shut up their houses against them : Europeans generally cool their apartments by means of straw, grass, or matting, constantly watered.

On the coasts of Coromandel and Malabar, the climate and seasons are very different at the same time. The whole of the year being divided into wet and dry; while one coast is saturated with rain, the other is scorched by heat. In the mountainous parts, the rain falls much earlier. In the north-west of Hindostan, towards the banks of the Indus, the thermometer generally varies from 90° to 100° during the months of June and July. At Surat, the annual variations are from 59° to 96°; and at Bombay from about 64° to 98°. The hottest months on the Malabar coast are April and May. At Cochin, during the former, the thermometer sometimes rises to 105°.

Though the mountains of the northern confines are clad in perpetual snow, winter is un-known on the plains. The heat is here frequently extreme; while thunder, lightning, and hurricanes are often so tremendous, that nothing experienced in Europe, can give an adequate idea of them; and most parts are deluged with rain at particular seasons. Near the coast the winds blow alternately from the land and sea; but, in the interior, the refreshing influence of the seabreeze is not felt. In Bengal Fahrenheit's thermometer often rises to 110°, in the hottest part of the year. During March, April, and May, with the early part of June, the season is dry and hot in this province. The four succeeding months are generally rainy; while January and February are subject to excessive fogs.

At Calcutta the range of the thermometer is sometimes 40° ; the following list shows the greatest and least temperature of the seven months, from October to April inclusive, with the prevailing winds of that period.

Months.	Maximum.	Minimum.	Winds.
October November . December . January February . March April	94° 89 88½ 85 92 104 110	70° 60 52 63 68 72 72 72	North. ditto. North-east. ditto. ditto. South. ditto.

The whole of Mysore, enclosed by the eastern and western ghauts consists of a table land about 3000 feet above the sea, from which rise several chains and groups of hills, that give birth to many of the rivers that water the lower grounds near the coast: this is perhaps more temperate and healthy than any other tract of equal extent within the tropics. The torrents of rain, which are poured so copiously on both the coasts, have their force broken by the mountains on each side, and only reach the interior in frequent and agreeable showers.

In Bengal, and some other places, the rain often pours down with such continued violence, that four or five inches frequently fall in a single day, during the first two months of the monsoon. The annual quantity in the lower parts of this province is generally between seventy and eighty inches. When the rain ceases, and the sky becomes clear, the moisture of the ground renders the evaporation great, and this, as the weather cools, causes the dews to be excessively penetrating, and the fogs thick. Here a large quantity of moisture is now retained by the marshes, woods, and jungles, full of decayed vegetable matter, which protracts the power of vegetation through the winter. The barometer is remarkably steady in most parts of India throughout the year. at the medium of thirty inches.

Hindostan has little variety of soil, considering its extent. It is almost universally a light, porous, black, mould; except in the more elevated parts, which are stony; and some few districts towards the western borders are sandy. The valleys have rich alluvial deposits. Cultivation is in the rudest state; and has been stationary for ages: it depends largely on irrigation, and in travelling through the country an opinion may always be formed of the wisdom of the government, and condition of the people, from the number and state of preservation of the watercourses. Rice is the principal article of nourishment of the natives, and the first object of attention in the cultivation of it is to have the soil plentifully supplied with water.

In Hindostan Proper the harvest is divided into two periods, the Khereef and the Rubbee; the former is cut in September and October, the latter in March and April.

The ploughs here merely scratch the soil to the depth of two or three inches; and the harrow in many districts consists of a single rake, in others the want of it is supplied by the branch of a tree.

In the lower parts of the country, where the soil is annually enriched by the overflowings of the rivers, and particularly in those of Bengal, habitations placed on elevated mounds, and fields above the rest of the country, appear like islands in the water. During the prevalence of the flood, the only means of communication between distant places is a navigation over the fields, where the ears of rice are frequently floating on the surface. The peasants go in this manner to the markets, accompanied by their families and domestic animals, from an apprehension that the water may suddenly increase, and drown their children and establishment. On the subject of the agriculture of Bengal Mr. Hamilton makes some remarks applicable to the whole of Hindostan.

'A cultivator,' he observes, 'who employs servants, employs one for each plough, and pays him monthly wages, which on an average does not exceed one rupee per month, and in a very cheap district the wages are so low as half a rupee; but the task on a medium of one-third of an acre per day is completed by noon. The cattle are then left to the herdsman's care, and the ploughman follows other occupations during the remainder of the day. Generally he cultivates some land on his own account, and this he commonly rents from his employer for a payment in kind. If the herd be sufficiently numerous to occupy one person, a servant is entertained, and receives food, money, and clothing, to the value of one rupee and a half per mensem. The plough itself costs less than a rupee. The cattle employed in husbandry are of the smallest kind, the cost on an average being not more than five rupees each. The price of labor may be computed from the usual hire of a plough with its yoke of oxen, which may be stated on the medium to be about four-pence per day. The cleaning of the rice is executed with a wooden pestle and mortar, the allowance of husking it being nearly uniform; the person performing this contracting to deliver back five-cighths of the

weight in clean rice, the surplus, with the chaff or bran, paying for the labor. Five quarters of rice per acre are reckoned a large produce, and a return of fifteen for one on the seed.'

Other staple productions of Hindoo agriculture are tobacco, sugar, silk, cotton, and indigo. Hindostan also produces generally the fruits of the torrid zone; mangoes, oranges, pine-aoples, mulberries, and grapes are common.

In nothing does Hindostan differ so much from Europe as in its forest trees. The fir, of all our trees, is the only one that is indigenous there, and it is only found in the northern mountains. Its best timbers are teak, saul, and toone; it has also a variety of woods for furniture. The fish differ considerably from those of Europe; but the quadrupeds and birds are the same as are to be found in several other warm countries. The tiger, lion, and elephant, are met with; and every department of zoology is rich in species.

The diamond takes the lead in the mineral riches of India; sapphires, topazes, and rubies, are also found, as well as gold; but the particular regions distinguished for these, as well as the details of the commerce and manufactures generally, are noticed in the description of the vanous provinces, districts, and towns.

Two distinct professions of religion are recognised here, the Hindoo and the Mahommedan; but the professors of the former faith are about seven times as numerous as those of the latter. There are also many Christians intermixed with the other classes of the population; and a few Parsees, or followers of Zoroaster, particularly on the western coast, with some of the ancient Jaimas in other parts.

Of the peculiarities of the Hindoo religion, Mr. Mill, in his history of British India, observes, ' Besides the causes which usually give superstition a powerful sway in ignorant and credulous ages, the order of priests obtained a greater authority in India than in any other region of the globe; and this again they employed with astonishing success in multiplying and corroborating the ideas on which their power and consequence depended. Every thing in Hin-dostan was transacted by the deity. The laws were promulgated, the people were classified, the government was established, by the divine being. The astonishing exploits of the aivinity were endless in that sacred land. For every stage of life, from the cradle to the grave, for every hour of the day, for every function of nature, for every social transaction, God prescribed a number of religious observances. And meditation upon his incomprehensible attributes, as it was by far the most difficult of all human operations, so was it that glorious occupation which alone prepared the intense votary for the participation of the divine nature.' See BRAHMINS.

The Mahom medans are divided into the two great sects of Soonies and Shiahs. The first acknowledge Abubekir, Omar, and Osman, as the legitimate successors of Mahomet; while the latter curse these personages, and call them usurpers, saying that Aly was the first lawful caliph. Except in this point, there is not much difference between them; but there is a number of subdivisions; and they have as many saints as

are to be found in the Romish kalendar. They are also divided into four great tribes of Shaikh, Syed, Patau, and Mogul. The first are either descended from Arabs, or converts to their religion. The second claim their descent from Mahomet, and are the same as the Emirs of Turkey, but are generally descendants of Persians. The third are Afghauns or their descendants; and the fourth persons of Mogul or Tartar origin. The third class of inhabitants are the Seiks, who possess the province of Lahore. Their religion is described as pure deism: but the common people retain many of the tenets of their Hindoo or Mahommedan ancestors.

Various languages are spoken in Hindostan; but the correspondence of the higher orders of people is generally carried on in Persian. The Hindoostanee, being a mixture of Persian and the current language of the Hindoos, may be esteemed the most useful of the vernacular tongues, there being but few villages from Cashmeer to Cape Comorin in which some person does not understand it. The learned and religious language of the Hindoos is Sanscrit, and of the Mahommedans, Arabic.

Marriage is considered among the Hindons as a religious duty; as it is 'by this that a man enters on the second state of existence, and takes his place in society ;' and, as none but male descendants can perform the obsequies to the manes of their ancestors, it is thought an irreparable calamity to die without male issue. Scarcely any state can be more degrading, however, than that of the women among the Hindoos. Till three years after their nuptial age they are entirely at the disposal of their father; and it is one of the sacred duties of a parent to place his daughter in a situation to become a mother. If he neglects this, till the time above specified, he forfeits all control over her, and she is then at liberty to choose for herself. When married she is immured in her husband's dwelling, and her dependence upon him is perpetual and entire. 'By a girl, or by a young woman,' say the institutes of Menu, 'or by a woman advanced in years, nothing must be done even in her own dwelling place according to her own mere pleasure: in childhood a female must be dependent on her father; in youth on her husband; her lord being dead, or her sons; a woman must never seek independence.' If ever so ill treate l, she is commanded to revere her husband as a superior being. Polygamy is tolerated, but females, except among the Nairs, are not permitted to marry a second time. A husband can dismiss his wife on numerous pretences; but there is nothing that can dissolve the wife from her matrimonial engagement. She is never permitted to eat in the presence of her husband. 'The young wife,' says the abbé Dubois, 'beaten by her husband, and harassed by her mother-in-law, who treats her as a slave, finding no remedy for ill usage but in flying to her father's house-recalled by fair promises of kinder treatment-the word broken-recourse had to the same remedy-but at last the children which she brings into the world, and other circumstances compel her to do her best, by remaining in her husband's house, with the show of being contented with her lot.-The object for

which a Hindoo marries is not to gain a companion to aid him in enduring the evils of life, but a slave to bear children, and be subservient to his rule.' Marriages are contracted at an early age by both parties. An unmarried man at twenty-five, and a female at fifteen, would be considered as extraordinary occurrences. Girls are generally married between the age of seven and nine; but remain at their father's house for a few years till they are considered fit to go home.

In former ages human sacrifices were common in Hindostan, and numerous acts of religious suicide still occur. Children are thrown to sharks in the Ganges, devotees plunge themselves into the sacred and fatal stream, widows expire on the funeral piles of their husbands, and it is considered as one of the grandest achievements of piety for the deluded objects of Indian superstition to sacrifice themselves to the honor of their gods on solemn festivals. On these occasions the image of the supposed deity, as at Juggernauth, mounted on a ponderous car, is drawn in procession by a multitude of priests and worshipers. The devotees, even parents, with children in their arms, throw themselves before the wheels of his car, and are instantly crushed to death.

The Hindoos are generally below the Europeans in stature, and their muscular strength is less than their bodily frame seems to indicate. The form of the females is slender and delicately proportioned, and ' their skins,' says Mr. Orme, ' are of a polish and softness beyond that of all their rivals on the globe.'

The Hindoo has been well described as a kind of sensitive plant; his imagination and his passions are easily inflamed, and his whole mental powers seem to be in unison with the delicacy of his structure. The simplicity of his food, and the smallness of his consumption, as well as the climate, have, undoubtedly, an effect in producing that feebleness which so strongly marks him. Many Hindoos abstain from the use of animal food, in consequence of their peculiar religious belief; and where a total prohibition does not exist it is but little used. Their agility is manifested in those contortions and feats which render them the most complete tumblers and jugglers in the world. Their messengers will travel, and their troops march, quicker than the most robust Europeans. Among the distinguishing traits of the Hindoo character must be classed indolence, falsehood, avarice, apathy, filth, and indelicacy. It is a maxim with them, that ' it is more happy to be seated than to walk, it is more happy to sleep than to awake, but the happiest of all is death." This listlessness is not merely the effect of the climate and manner of living, but it is an evident and natural consequence of their mode of native government and religion. Even Mr. Scott Waring, comparing the females of India with those of Persia, observes, 'their terms of reproach are indelicate in the utmost degree. I will not disgust the reader by noticing any of them, but I may safely aver that it is not possible for language to express, or imagination to conceive, more indecent or grosser images.'

Hindostan was but little known to those ancient writers whose works have come down to us, prior to the expedition of Alexander. It appears from Arian that he entered the country of Cabul, about the year 326 B. C., and found it possessed by several petty chiefs. Crossing the Indus he was opposed by Poor, or Porus, on the banks of the Behut (Hydaspes); after defeating whom he continued his route across the Chunaub and Ravee rivers, until he reached the Bayeh or Setlege (Hyphasis), whence he returned by the same road to the Behut. Embarking here in boats, he proceeded to Pattala (Tatta), at which place having landed, he continued his march through Mekran to Persia. This expedition appears to have had little effect on the politics of Hindostan.

The reigns of Bickermajeet and Chunderpaul are placed in the centuries before and after our era; and there is a tradition, that about this time one of the kings of Persia invaded Hindos-The next event of consequence which tan. occurred was the introduction of some of the pastoral tribes of Scythians into the mountains which separate Hindostan from Balkh. This, as may be collected from De Guisne's History of the Huns, and other circumstances, took place about the beginning of the fifth century. For a considerable period they conducted themselves peaceably, and by degrees spread over all the region lying between Persia and the Indus. They were at first known by their Tartar name of Alkai, or Altai, but subsequently by that of Afghaun.

At the end of the seventh century the Arabs, having subdued all Persia, invaded Cabul, and were for a time successful; but in the year 697 they were defeated by the Hindoos, and their general, Khaled Ben Abdullah, with a number of his followers, made prisoners. The general obtained permission to settle with his followers in the mountains of Paishawur, where, intermarrying with the Afghauns, they converted them to the Mahommedan religion. It is from this union that several of the tribes sprung who now erroneously boast of being descended from the famous Khaled. The Afghauns, in process of time having much increased, descended from the mountains, and the Hindoos endeavoured in vain to drive them back.

The next important point in the history of this country was the occupation of the city of Ghizne, by the Persian chief Abistagy, and the foundation of the Ghiznean empire by his successor Subactageen, whose son, the celebrated Mahmoud, supported by the Afghanns, invaded Hindostan seven times between the years 1001 and 1030, and subdued the country as far as the Jumna. The Ghiznean empire existed till the year 1189, when it was put an end to by an Afghaun chief named Mohammed Ghory, who captured Lahore, and caused the last prince of that dynasty to be put to death. Mohammed Ghory extended his conquests to Benares. He was assasinated in 1206: upon which Cattub mounted the throne, and became the first Mussulman king of Delhi, extending his dominions to the mouths of the Ganges. The Afghauns kept po⁻ session of the capital, and the title of emperors

of Hindostan, till the year 1398, when Timour, or Tamerlane, invaded it, took Delhi, and compelled the weak Mahmoud to seek his safety in flight. And now another formidable Mahominedan power, called the Bhamenee Sultans, became established at Kulberga, in the Deccan, or south of Hindostan; when several of the governors of provinces threw off their allegiance to the court of Delhi, and assumed independence. Timour remained but a few months in India; and Mahmoud returned to his capital, and to the nominal title of emperor, which he retained for fourteen years; his power, however, was but nominal. Upon his death, a Syed took possession of the throne, and had for his successors, his son, grandson, and great-grandson; but the only territory remaining to them was a small district round Delhi.

In 1450 Beloly, of the Afghaun tribe of Lody, took possession of the throne, which he, and his son, and grandson, retained till 1525; when Ibrahim was defeated by the Mogul prince Zehire Addeen Mohammed Baber. During the period these two last dynasties sat on the throne of Delhi, four other independent Mahommedan powers had been established in the Deccan, or south, on the ruin of the first, or Bhausenee family of Kulberga, viz. the Adilshahy of Bejapore; the Bereed, or Ahmedshahy, of Beider; the Nizam Shahy of Ahmednagur; and the Cuttabshahy of Golcondah. The Hindoo Bijanagur prince also retained considerable power. The provinces of Bengal, Joanpore, and Gujerat, were also become distinct kingdoms.

Sultan Baber, the founder of the Mogul dynasty of Hindostan, was the son of Omar, who was the son of Abu Syed, the son of Mohammed, the son of Miran Shah, the son of Timour, or Tamerlane, on which account his is sometimes called the Timourean dynasty. Baber extended the Mogul conquests to the borders of Bengal, but died after a short reign of five years, and was succeeded by his son Homayon. This prince subdued both the provinces of Gujerat and Bengal, which had been long independent of Delhi; but in the year 1540 received two signal defeats from Shere Khan, an Afghaun of the tribe of Soor, and was compelled to seek refuge in Persia. Shere took the title of Shere Shah, and governed Hindostan with great ability for ten years, until he was killed at the siege of Callenger, a strong fortress in Bundelcund. His son Selim died in 1551, after a reign of nine years. During these two reigns, caravanseras were erected at every ten miles along the high road from Bengal to the banks of the Indus. On the death of Selim, his cousin Mohammed, having first murdered a youth who was the heir, took possession of the throne; but was in his turn dispossessed by a competitor named Ibrahim, who was also driven out by Sekunder, a nephew of the emperor Selim.

In 1554 the Mogul emperor Homayon, having returned to Hindostan with some Persian auxiliaries, defeated Sekunder in the vicinity of Sirhind, and again took possession of the throne; which, however, he enjoyed but a short period, as he died at Delhi in the following year, and was succeeded by his son Akbar. From 1555 till 1707, the throne of Hindostan

was occupied by Akbar, Jehangire, Shah-Jehan, and Aurungzebe, under the title of Aalumgire, four of the most powerful monarchs that ever governed that kingdom. Their territories extended from Candahar to Arracan, which, in a straight line, would measure 2000 miles; and they subdued the four Mahommedan states of the Deccan, or south of India. But from this period the Mogul empire began to decline. The attacks of the Mahrattas, the Rajpoohs, and the Seiks, joined to domestic dissentions, shook the throne, till the year 1720, when it was occupied by the emperor Mohammed Shah. It was during this reign that the Mahrattas, in the year 1735, carried their arms to the vicinity of Delhi; and in 1739 Nadir Shah of Persia took and plundered Delhi, and separated from Hindostan all the countries to the west of the Indus. After this the Mahrattas obtained possession of several of the provinces; the nizam or governor of the Deccan threw off his allegiance, and the mandates of the Mogul emperor were disobeyed. After an unfortunate reign, of twenty-seven years, Mohammed Shah died, and was succeeded, in 1747, by his son Ahmed Shah, who was deposed and blinded in the year 1753, and succeeded by Aalumgire II. During this reign the city of Delhi was twice taken and sacked by the Afghaun king of Cabul, and the Mahrattas; which events completely annihilated the little remaining power of the emperor. In 1761 the prince Ali Goher obtained the title of emperor Shah Alum II.; and, after residing for some years under the protection of the English at Allahabad, raised a small force, and took possession of the ruins of his capital. He was at length cruelly blinded by a Rohillah chieftain; he, however, continued his nominal reign, under the protection of the Mahrattas, till 1803, when Delhi was taken by the British. He died in the year 1806, after a long and disastrous reign of forty-four years. With this prince the Mogul dynasty may be said to have terminated : under the article INDIA will be found a sketch of the rise and progress of our important possessions here.

IIINGE, n.s. & v.a. Dan. hang, from Goth. gang; Goth. and Teut. ang, a hook. Joints on which a door or gate turns; the four cardinal points of the compass: figuratively a governing rule, or principle of action: to be off the hinges is a phrase signifying a state of indisposition, irregularity, or disorder: hinge to furnish with hinges; to bend.

Be thou a flatterer now, and hinge the knee, And let his very breath, whom thoul't observe, Blow off thy cap. Shakspeare

Then from the *hinge* their strokes the gates divorce, And where the way they cannot find, they force.

Denham.

If when the moon is in the *hinge* at East, The birth breaks forward from its native rest;

- Full eighty years, if you two years abate,
- This station gives. Creech's Manilius. At the gate

Of heaven arrived, the gate self-opened wide,

On golden hinges turning. Milton. The man's spirit is out of order, and off the hinges; and, till that be put into its right frame, he will be perpetually disquieted. Tillotson.

The other hinge of punishment might turn upon a law, whereby all men, who did not marry by the ago Id.

of five and twenty, should pay the third part of their revenue. Temple.

Heaven's imperious queen shot down from high; At her approach the brazen *hinges* fly, The gates are forced. Dryden.

Methinks we stand on ruins, Nature shakes About us, and this universal frame So loose, that it but wants another push

To leap from off its hinges.

HINGHAM, or HENGHAM (Sir Ralph de), an English lawyer of the thirteenth century, was the proprietor of an estate at Hingham, in Norfolk. He appears also to have held a canonry in St. Paul's cathedral, London, and was one of the justices of the king's bench, and a justice itinerant under Edward I., among the number of those first appointed. He was the chief commissioner for the government of the kingdom, while Edward visited Palestine; but, after the king's return, was dismissed from office for bribery, and fined7000 marks, on the non-payment of which he was imprisoned, and afterwards banished, with nine of his brethren. Hingham was in disgrace till the accession of Edward II., in 1308, when he was raised to the office of chief justice of the common pleas, but died the same year. He is chiefly known from Selden having published, in the original Latin, with English notes, a treatise of his entitled Summa Magna et Parva, relating to the ancient forms of pleadings; and composed a register of writs mentioned by Dugdale.

HINGHAM, a market town and parish of Norfolk, ninety-nine miles north from London. The buildings are tolerably neat, but the streets are irregular. The church is a very large building with a loty tower, erected in the reign of Edward III. In the church were held seven guilds, each having a stipendiary chaplain serving at the respective altars, constituting a choir. The tower is very high and large, and contains eight bells. The river Yare has its source near this town. Market on Saturday.

HINGHAM, a port town of Plymouth county, Massachusetts, fourteen miles south-east from Boston, and 455 from Washington. It lies on the south side of Boston harbour, and contains three congregational churches, a woollen manufactory, and a well endowed academy. It has some trade, and is a place of considerable resort of company from Boston in the summer. Population about 2400.

HING-HOA, a city of China of the first rank, in the province of Fo-kien, near the sea-coast. The walls are thick, and the streets well paved. The city is adorned with several triumphal arches, and majestic public buildings. Silk and rice are its chief commodities. It is 900 miles south of Pekin.

HINOJOSA, a town of Spain in Cordova. It is surrounded with mountains, and has a manufacture of coarse cloth, much worn by the Franciscans. Inhabitants 4000. Eighteen miles north of Llerena.

HINT, v. a. & n. s. Fr. enter, indice; Latin indicium. To bring to mind by a slight allusion; to mention imperfectly; to insinuate: used with the particle at, it implies a slight reference to some subject; a suggestion or intimation.

VOL. XI.

HIP

On this hint I spake,

She loved me for the dangers I had past.

Shakspeare. Othello. Let him strictly observe the first stirrings and intimations, the first hints and whispers of good and evil, that pass in his heart. South.

Actions are so full of circumstances, that, as men observe some parts more than others, they take different hints, and put different interpretations on them. Addison.

Speaking of Augustus's actions, he still remembers that agriculture ought to be some way hinted at throughout the whole poem. Id. On the Georgicks.

Willing to wound, and yet afraid to strike, Just hint a fault, and hesitate dislike. Pope.

In waking whispers, and repeated dreams,

To hint pure thought, and warn the favoured soul. Thomson.

HIP, n. s., v. a. & interj.	From Sax. beopa.
HIP'PISH, adj.	(The joint of the
HIP'SHOT,	(thigh; the haunch.
HIP'WORT.) To have on the hip.

A low phrase. To have an advantage over another. It seems to be taken from hunting, the hip or haunch of a deer being the part commonly seized by the dogs: to sprain the hip: hip-hop a cant word: hip, an exclamation, as the Latin *heus*; hippish, fanciful, hypochondriac; hipshot, having a dislocated hip: hipwort a plant; hip the fruit of the dogrose. See HEPS.

------ And of a gode brede

Hire hippes were. Chaucer. Boke of the Duchesse. Eating hips, and drinking watery foam. Hubberd's Tale. His horse was hipped. Shakspeare.

His horse was hipped. Shakspeare. How now, which of your hips has the most profound sciatica ? Id.

If this poor brach of Venice, whom I cherish For his quick hunting, stand the putting on,

I'll have our Michael Cassio on the hip.

Why should you want? Behold, the earth hath roots;

The oaks bear masts, the briars scarlet hips. Id.

Years of store of haws and hips do commonly portend cold winters. Bacon's Natural History. So shepherds use

To set the same mark on the hip

Both of their sound and rotten sheep. Hudibras. Hippocrates affirmeth of the Scythians, that, using

continual riding, they were generally molested with the sciatica or hip gout. Browne's Vulgar Errours.

Against a stump his tusks the monster grinds, And ranched his *hips* with one continued wound.

Dryden.

Id.

Why do you go nodding and waggling so like a fool, as if you were hipshot? says the goose to the gosling. L'Estrange.

Your different tastes divide our poet's cares; One foot the sock, t'other the buskin wears: Thus, while he strives to please, he's forced to do't, Like Volscius hip-hop in a single boot. Congreve.

Hip, in the materia medica, the fruit of the dogrose or wild brier. See Rosa. It contains an acidulous, yet sweetish pulp; with a rough prickly matter enclosing the seeds from which the pulp ought to be carefully separated before it be taken internally. The Wirtemberg College observes, that from a neglect of this, pulp of hips sometimes occasions a pruritus and uneasiness about the anus; and the conserve of it has been known to excite violent vomiting. The conserve is the only officinal preparation of this fruit which possesses any medical virtues, but is merely used by the apothecaries as a vehicle for other remedies. The Edinburgh College omit it.

HIP, in architecture, the angle formed by two parts of the roof when it rises outwards. Hips are also those pieces of timber which are placed at the corners of a roof. They are much longer than rafters, on account of their oblique position.

HIPPARCHIA, a celebrated lady born at Maronea in Thrace, in the time of Alexander the Great. Her attachment to learning and philosophy was so great, that, having attended the lectures of Crates the cynic, she fell in love with him, and resolved to marry him, though he was both old and deformed. Crates himself was prevailed upon by her friends, to try to dissuade her from her singular choice, which he did by displaying his poverty, his cloak, his bag, and his deformity, but all in vain. At last he told her she could not be his wife, unless she resolved to live as he did. This she cheerfully agreed to, assumed the habit of the order, and accompanied him every where to public entertainments, &c., which was not customary with the Grecian ladies. She wrote several tragedies, Philosophical Hypotheses, and Reasonings and Questions proposed to Theodorus the Atheist: but none of her works are extant.

H1PPARCHUS, an eminent astronomer, born at Nice, in Bithynia, who flourished between the 154th and 163rd Olympiads. Ilis Commentary upon Aratus's Phenomena is still extant. This astronomer was acquainted with the particular motion of the fixed stars from west to east, by which their longitude changes; and, by foretelling eclipses, he taught mankind not to fear them. Pliny, who relates this, admires him for making a review of all the stars; by which his descendants would be enabled to discover whether they are born and die, whether they change their places, and whether they increase and decrease.

HIPPIA, in botany, a genus of the polygamia necessaria order, and syngenesia class of plants. The receptacle is naked; there is no pappus; the seeds are naked with broad margins; cal. hemispheric, and subimbricated : the radius consists of ten corollæ, obscure, and rather cleft into three. Species four, small plants resembling the tansy.

HIPPISLEY (Sir John Coxe), bart. D.C.L. F.R. and A.S., was descended of an ancient Somersetshire family, and the only surviving son of William Hippisley, esq., of Yatton, was born in 1765. Having graduated as D.C.L, at Hertford College, Oxford, in 1776, he became a member and bencher of the Inner Temple; but on his return from Italy, in 1780, he was ap-pointed through the interest of lord North to an office of trust in India, which he held during the wars with Hyder Ali and Tippoo Saib. Returning to England in 1790, he was elected member of parliament for Sudbury, of which borough he became recorder, and represented it also in five parliaments. Mr. Hippisley in 1796 negociated a marriage between the duke of Wirtemberg and the princess royal of England, on which occa-sion he was raised to the baronetage. Being an active magistrate and a warm supporter of

many useful institutions, he distinguished himself on several occasions in the house by his speeches, especially upon Irish affairs, and was a strenuous supporter of Catholic emancipation. He published an octavo volume in favor of this measure in 1806, a speech on Mr. Grattan's motion in 1812, and a series of letters to the earl of Fingal in 1813. He was also the author of a treatise on Prison Discipline, printed in 1823, recommending the hand crank-mill for the treadmill, as a punishment for convicts. His death took place May 3d, 1825.

HIPPO, or HIPPON, in ancient geography, two towns on the coast of Africa, now called Bicerta and Bona.

HIPPOBOSCA, the horse fly, in zoology, a genus of insects belonging to the order of diptera. The beak consists of two valves, is cylindrical, obtuse and hanging; and the feet have several claws. There are four species, distinguished by their wings, &c. The most remarkable is the hippobosca equina, the pest of horses and cows. This insect is broad, flat, shining, and as it were scaly. Its head, thorax, and abdomen, are yellow, undulated with brown; and the legs are intersected with yellow and brown. The wings, crossed one over the other, exceed the length of the body by above one-half; they are transparent, tinged with a little yellow towards their outward edge, and have a spot near that edge of a brown color. These insects are very difficult to be killed, on account of the hard crustaceous shell which covers them; and they fix so close and fast to the poor animals with their claws, that they cannot rub or bite them off without wounding themselves.

HIPPOCASTANUM, the common horsechestnut. See Æsculus. It may be here added, that, from several experiments in the French Memoires d'Agriculture, it appears that the fruit of the horse-chestnut affords a wholesome nourishment for cattle, and may even be employed with success in fattening them. It is said to render the tallow of those fattened with it particularly firm. The milk yielded by cows fed upon it is also said to be thicker and richer than that produced from any other food. The fruit of this tree has been likewise used as food for sheep and poultry, and as soap for washing. It was much employed in powder as a sternutatory by an itinerant oculist, and has been recommended by some others in certain states of ophthalmia, headach, &c., in which errhines are indicated. Its effects as a sternutatory may also be obtained, by using it under the form of infusion or decoction drawn up into the nostrils. It is entirely with a view to its errhine power, that it has a place in the Pharmacopœia of the Edinburgh College.

IIIPPOCE'NTAUR, n. s. Gr. $\iota\pi\pi\sigma\kappa\epsilon\nu\tau\alpha\nu\rho\sigma\varsigma$; Fr. hippocentaure. A fabulous monster, half horse and half man.

How are poetical fictions, how are hippocentaurs and chimeras to be imagined, which are things quite out of nature, and whereof we can have no notion? Druden.

HIPPOCENTAURS, from $i\pi\pi\sigma_{\mathcal{C}}$, a horse, $\kappa\epsilon\nu$ - $\tau\epsilon\omega$, I spur, and $\tau\alpha\nu\rho_{\mathcal{C}}$, a bull. A people of Thessaly, inhabiting near mount Pelion, became thus denominated, because they were the first that taught the art of mounting animals; which occasioned some of their neighbours to imagine that the beast and man were but one creature. The hippocentaurs should seem to have differed from the centaurs in this, that the latter rode only on bullocks, and the former on horses, as t'e names intimate. See CENTAUR.

HI'PPOCRAS, n. s. Fr. hypocras, quasi vinum Hippocratis. A medicated wine.

Sack and the well-spiced hippocrass, the wine, Wassail the bowl, with ancient ribbands fine.

King.

259

HIPPOCRAS is composed of wine, with spices and other ingredients, and is much used in France, as a cordial after meals. There are various kinds of it, according to the kind of wine and other ingredients used : as white, red, claret, and strawberry hippocras; hippocras without wine; cyder hippocras, &c. The London Dispensatory directs it to be made of cloves, ginger, cinnamon, and nutmers, grossly powdered, and infused in canary with sugar; to this infusion may be added, milk, a lemon, and some slips of rosemary, and the whole strained through flannel. It is recommended as a cordial, and in paralytic and nervous cases.

HIPPOCRATES, the greatest physician of antiquity, was born in the island of Coos, in the eighticth Olympiad, and flourished during the Peloponnesian war. He was the first on record who laid down precepts concerning physic; and according to his biographer, Soranus, was descended from Hercules and Æsculapius. He was first a pupil of his father Heraclides, then of Herodicus, then of Gorgias of Leontium, the orator, and, according to some, of Democritus of Abdera. After being instructed in physic and the liberal arts, and losing his parents, he left Coos, and practised physic all over Greece; where he was so much admired for his skill, that he was publicly sent for to Perdiccas, king of Macedonia, who was then thought to be consumptive. But Hippocrates, as soon as he arrived, pronounced the disease to be entirely For, upon the death of his father Alexmental. ander, Perdiccas fell in love with Philas, his father's mistress; which Hippocrates discerning by the change her presence always wrought upon him, a cure was soon effected. Being entreated by the people of Abdera to come and cure Democritus of a supposed madness, he went; but, upon his arrival, instead of finding Democritus mad, he pronounced all his fellow citizens so, and Democritus the only wise man among them. He heard many lectures from him; which made Celsus and others imagine, that Hippocrates was the disciple of Democritus, though it is probable they never saw each other till this interview. Hippocrates had also public invitations from other countries. Thus, when a plague invaded the Illyrians and Pæonians, the kings of those countries entreated him to come to their relief: he did not go: but, learning from the messengers the course of the winds there, he concluded that the distemper would come to Athens; and, foretelling what would happen, applied himself to take care of the city and the students. Ile was indeed such a lover of his country, that when his

fame had reached as far as Persia, and Artaxerxe. entreated him, with a promise of great rewards, to come to him, he refused to go, saying that 'he had food, clothing, and a habitation in his own country : that it would be unworthy of him to aspire to the wealth or grandeur of the Persians, or to cure barbarians who were the enemies of Greece.' He also delivered his own country from a war with the Athenians, by prevailing with the Thessalians to come to their assistance, for which he received very great honors from the Coans. The Athenians also honored him greatly; they admitted him next to Hercules in the Eleusinian ceremonies; gave him the freedom of the city; and voted a public maintenance for him and his family in the prytanæum at Athens, where none were maintained but such as had done signal service to the state. He died among the Larissæans, some say in his ninetieth year, some in his eighty-fifth, others in his 104th, and some in his 109th. The best edition of his works is that of Foesius, in Greek and Latin. Hippocrates wrote in the Ionian dialect.

HIP'POCRATES'S SLEEVE, n. s. A woollen bag, made by joining the two opposite angles of a square piece of flannel, used to strain syrups and decoctions for clarification.

HIPPOCRENE, in ancient geography, a fountain of Mount Helicon, on the borders of Bœotia, sacred to the Muses. Ovid makes Hippocrene and Aganippe the same. See AGANIPPE.

HIPPOCRÉPIS, common horse-shoe vetch, in botany, a genus of the decandria order, and diadelphia class of plants: natural order thirtysecond, papilionaceæ. The legumen is compressed and crooked, with many incisions on the interior suture. There are five species; all low herbaceous trailing plants, with yellow flowers. They are propagated by seeds; but, having no great beauty, are seldom kept in gardens.

HIPPODROME, or HIPPODROMUS, from Gr. $i\pi\pi\sigma_{c}$, a horse, and $\delta_{\rho\sigma\mu\sigma_{c}}$, a course. In antiquity, a course wherein chariot and horse races were performed, and horses exercised. The Olympian hippodrome, or horse-course, was a space of ground 600 paces long, surrounded with a wall, near Elis, on the banks of the Alpheus. It was uneven, and in some degree irregular, on account of the situation; in one part was a hill of a moderate height, and the circuit was adorned with temples, altars, and other embellishments. See STADIUM. There is a famous hippodrome at Constantinople, which was begun by Alexander Severus, and finished by Constantine. The circus, called by the Turks atmeican, is 400 paces long, and above 100 paces wide. At the entrance there is a pyramidal obelisk of granite in one piece, about fifty feet high, terminating in a point, and charged with hieroglyphics. The Greek and Latin inscriptions on its base show that it was erected by Theodosius; the machines that were em-ployed to raise it are represented upon it in basso-relievo. There are some vestiges in England of the hippodromus, in which the ancient inhabitants of this country performed their races; the most remarkable is that near Stonehenge, which is a long tract of ground, about

S 2

350 feet, or 200 Druid cubits wide, and more than a mile and three quarters, or 6000 Druid cubits, in length, enclosed quite round with a bank of earth, extending directly cast and west. The goal and career are at the east end. The goal is a high bank of earth, raised with a slope inwards, on which the judges are supposed to have sat. The metre are two tumuli, or small barrows, at the west end of the course. These hippodromes were called in the language of the country rhedagua, the racer rhedagwr, and the carriage rheda, from the British word rhedeg, 'to run.' One of these hippodromes, about half a mile south of Leicester, retains cvident traces of the old name rhedagua, in the corrupted one of Rawdikes. There is another, says Dr. Stukely, near Dorchester; another on the banks of the Lowther, near Penrith in Cumberland; and another in the valley, just without the town of Royston.

HI'PPOGRIFF, n. s. Gr. $\iota\pi\pi\sigma g$ and $\gamma\rho\sigma\psi$; Fr. hippogriffe. A winged horse; a being imagined by Ariosto.

He caught him up, and without wing

Of hippogriffe bore through the air sublime.

Milton.

HIPPOLYTE, (St.), a small town of France, in the department of Doubs, Franche Comté, the chief place of the canton, and about eighteen miles south of Montbelliard. It is a post-town, and contains about 3500 inhabitants. Its situation is very picturesque, in the bottom of a valley, surrounded with high mountains, at the confluence of the rivers Doubs and Desoubre. On arriving at this spot an agreeable prospect meets the eye; it wanders delighted over ridges of mountains, cultivated hills, and delightful valleys near the town, of which the point of the steeple is just seen peeping out from the foot of the mountain. The verdure of the hemp which is cultivated in the valley, the vines, which cover the hills even to the tops, the majestic gloom of the forests which extend over the most elevated of the mountains, and the black smoke issuing from the numerous forges, give an indescribable charm to this smiling and animated picture. Here are manufactures of clock-makers' tools, jewellery, and gravers; likewise of hats, pipes, and brass work ; tan-houses, dye-houses, cheese factories, &c.; and in the neighbourhood are blast-furnaces, forges, and flatting-mills.

IIIPPOLYTF, (St.), a handsome town of the department of the Gard, Languedoc, the chief place of the canton of Vigan. It has a tribunal of commerce, and a council of manufactures, and is a post-town, with 5500 inhabitants. It is pleasantly situated at the foot of the Cevennes Mountains, on the Vidourle, not far from the source of that river. A canal running through it furnishes several fountains with water, and works a great number of mills. This town is rendered remarkable from the circumstance, that an insult offered to a priest, who was carrying the host through it to a sick person, furnished a pretext for the revocation of the edict of Nantes, which involved so many thousands in banishment and ruin on account of their religious opinions. It has manufactories of silk and cotton stockings, woollen stuffs, and glue, and large

tan-yaids; and carries on a commerce in fuits and silk.

IllePOLYTE, in fabulous history, a queen of the Amazons, who was conquered by Hercules, and married to Theseus : by whom she had

HIPPOLYTUS, famous in fabulous history for his virtue and his misfortune. His stepmother Phædra fell in love with him, and when he refused to pollute his father's bed, she accused him to Theseus of offering violence to her person. Her accusation was readily believed, and Theseus entreated Neptune to punish the incontinence of his son. Hippolytus fled from the resentment of his father; and, as he pursued his way along the sea shores, his horses were so frightened at the noise of sea-calves which Neptune had purposely sent there, that they ran among the rocks till his chariot was broken, and his body torn to pieces. Temples were raised to his memory, particularly at Træzene, where he received divine honors. Diana is said to have restored him to life.

HIPPOMANE, the manchineel tree, a genus of the monadelphia order, and monœcia class of plants: natural order thirty-eighth, tricoccæ: MALE has an amentum and bild perianthium, without any corolla: the FEMALE perianthium is trifid; there is no corolla; the stigma is tripartite; and the plum or capsule tricoccous. The species are,

1. II. biglandulosa, with oblong bay leaves, is a native of South America, and grows to as large a size as the mancinella, from which it differs mostly in the shape of its leaves.

2. H. mancinella, with oval sawed leaves, is a native of all the West India islands. It has a smooth brownish bark; the trunk divides upward into many branches, garnished with oblong leaves about three inches long. The flowers come out in short spikes at the end of the branches, but make no great appearance, and are succeeded by fruit of the same shape and size with a golden pippin. The tree grows to the size of a large oak. Strangers are often tempted to eat the fruit of this species; the consequences are, an inflammation of the mouth and throat, pains in the stomach, &c., which are very dangerous, unless remedies are speedily applied. The wood is much esteemed for making cabinets, book-cases, &c., being very durable, taking a fine polish, and not being liable to become worm-eaten: but, as the trees abound with a milky caustic juice, fires are made round their trunks, to burn out this juice; otherwise those who fell the trees would be in danger of losing their sight by the juice flying in their eyes. This juice raises blisters on the skin wherever it falls, turns linen black, and makes it fall out in holes. It is also dangerous to work the wood after it is sawn out; for, if any of the sawdust happens to get into the eyes of the workmen, it causes inflammation; to prevent which, they generally cover their faces with fine lawn during the time of working the wood. It is with the juice of this tree that the Indians poison their arrows.

3. 11. spinosa, with holly leaves, is a native of Campeachy, and seldom rises above twenty feet high; the leaves greatly resemble those of the common holly, and are set with sharp prickles at the end of each indenture. They are of a lucid green, and continue all the year. These plants, being natives of very warm climates, cannot be preserved in this country without a stove; nor can they by any means be made to rise above five or six feet high, even with that assistance. They are propagated by seeds; but must have very little moisture, or they will certainly be killed by it —These trees have all a very poisonous quality, abounding with an acrid_milky juice of a highly caustic nature.

HIPPOMANES, from $i\pi\pi\sigma c_s$, a horse, and $\mu\alpha\nu\alpha$, madness, a sort of poison famous among the ancients as an ingredient in amorous philters, or love charms. Authors are not agreed about the nature of the hippomanes. At the end of Bayle's Dictionary is a very learned dissertation on the hippomanes, and all its virtues real and pretended.

IHPPONA, or EPONA, from $i\pi\pi\sigma c_s$, a horse, in ancient mythology, the goddess of horses. See EPONA.

HIPPONAX, a Greek poet, born at Ephesus, A.A.C. 540. He cultivated the same satirical poetry as Archilochus, and was not inferior to him in the beauty and vigor of his lines. His satirical raillery obliged him to fly from Ephesus. As he was naturally deformed, two brothers, Buphalus and Anthermus, made a statue of him; which, by the ugliness of its features, exposed the poet to universal ridicule. Hipponax, resolving to revenge the injury, wrote such bitter invectives and satirical lampoons against them, that they hanged themselves in despair.

HIPPOPHAE, sea-buckthorn; a genus of the tetrandria order, and diæcia class of plants; natural order sixteenth, calycifloræ: MALE CAL. bipartite: con. none: FEMALE CAL. blind: COR. none: there is one style, and a monospermous berry. The chief species are,

1. II. Canadensis, with a shrubby brown stem, branching eight or ten feet high, with oval leaves, and male and female flowers on different plants.

2. II. rhamnoides, with a shrubby stem, branching irregularly eight or ten feet high, having a dark brown bark. It is armed with a few thorns, and has spear-shaped, narrow, sessile leaves, of a dark green above, and hoary underneath. Both these species are very hardy, and may be propagated in abundance by suckers from the roots, by layers, and by cuttings of their young shoots. They are retained in gardens on account of their two-colored leaves in summer; and, in winter, on account of the appearance of the young shoots, which are covered with turgid, irregular, scaly buds. Goats, sheep, and horses, eat this species; cows refuse it. IHPPOPHAGI, in ancient geography, a peo-

111PPOPIAGI, in ancient geography, a people of Scythia, so called from their living on horse-flesh; the fare at this day of the Tartars, their descendants. Also a people of Persia.

their descendants. Also a people of Persia. HIPPOPODES, or HIPPOPODEE, from $i\pi\pi\sigma c_r$, horse, and $\pi \nu c_r$ a foot, in ancient geography, an appellation given to a certain people situated on the banks of the Seythian Sea, who were supposed to have had horses' feet. The Hippopodes are mentioned by Dionysius, Mela, Pliny, and St. Augustine. It is conjectured that they had this HIPP'OPOTAMUS, n. s. Gr. $i\pi\pi\sigma_g$ and $\pi\sigma\sigma\mu\rho_g$. The river horse. An animal found in the Nile.

HIPPOPOTAMUS, the river horse, is a genus of quadrupeds belonging to the order of belluæ, the characters of which are these : They have four foreteeth in the upper jaw, disposed in pairs at a distance from each other; and four prominent fore-teeth in the under jaw, the intermediate ones being longest. There are two tusks in each jaw; those of the under one very long, and obliquely truncated; in both they stand solitary, and are recurvated. The feet are hoofed on the edges. There is but one known species, viz. the hippopotamus amphibius, or river horse. The head of this animal is of an enormous size, and the mouth vastly wide. The ears are small and pointed, and lined within very thickly with short fine hairs. The eyes and nostrils are small in proportion to the bulk of the animal. On the lips are some strong hairs scattered in patches. The hair on the body is very thin, of a whitish color, and searcely discernible at first sight. There is no mane on the neck, as some writers assert, only the hairs on that part are rather thicker. The skin is very thick and strong, and of a dusky color. The tail is about a foot long, taper, compressed, and naked. The hoofs are divided into four parts. The legs are short and thick. In bulk it is second only to the elephant. The length of a male has been found to be seventeen feet, the circumference of the body fifteen, the height nearly seven, the legs nearly three, the head above three and a half, and the girth nearly nine. The mouth, when open, is above two feet wide; and furnished with fortyfour teeth of different figures (including the cutting teeth and the canine). The cutting, and particularly the canine teeth of the lower jaw, are very long, and so hard and strong that they strike fire with steel. This circumstance, it is probable, gave rise to the fable of the ancients, that the hippopotamus vomited fire from his mouth. The substance of the canine teeth is so white, so fine, and so hard, that it is preferable to ivory for making artificial teeth. The cutting teeth, especially those of the under jaw, are very long, cylindrical, and chamfered. The canine teeth are also long, crooked, prismatic, and sharp, like the tusks of the wild boar. The grinders are square or oblong, like those of man, and so large that a single tooth sometimes weighs three pounds. The tusks, according to Dr. Sparman, are twenty-seven inches long. With such powerful arms, and such a prodigious strength of body, the hippopotamus might render himself formidable to every other animal. But he is naturally of a mild disposition, and is only formidable His bulk is so great, that when provoked. twelve oxen have been found necessary to draw one ashore, which had been shot in a river above

the Cape; and, according to Hasselquist, its hide is a load for a camel. Though he delights in the water, and lives in it as freely as upon land, yet he has not, like the beaver or otter, membranes between his toes. The great size of his belly renders his specific gravity nearly equal to that of water, and makes him swim with ease. These animals inhabit the rivers of Africa, from the Niger to Berg River, many miles north of the Cape of Good Hope. They formerly abounded in the rivers nearer the Cape, but are now almost extirpated. They are not found in any of the African rivers which run into the Mediterranean, except the Nile, and even there only in Upper Egypt, and in the fens and lakes of Ethiopia, which that river passes through. From the unwieldiness of his body, and the shortness of his legs, the hippopotamus is not able to move fast upon land, and is then extremely timid. When pursued, he takes to the water, plunges in, sinks to the bottom, and is seen walking there at full ease; he cannot, however, continue there long without often rising towards the surface ; and in the day-time is so fearful of being discovered, that, when he takes in fresh air, the place is hardly perceptible; for he does not venture even to put his nose out of the water. In rivers unfrequented by mankind he is less cautious, and puts his whole head out of the water. If wounded, he will rise and attack boats or canoes with great fury, and often sink them by biting large pieces out of the sides: and frequently people are drowned by these animals; for they are as bold in the water as they are timid on land. It is reported that they will at once bite a man in two. In shallow rivers the hippopotamus makes deep holes in the bottom, in order to conceal his great bulk. When he quits the water, he usually puts out half his body at once, and smells, and looks around; but sometimes rushes out with great impetuosity, and tramples down every thing in his way. During the night he leaves the rivers in order to pasture; when he eats sugar-canes, rushes, millet, rice, &c., consuming great quantities, and doing much damage in the cultivated fields. But as he is so timid on land, it is not difficult to drive him off. ' The Egyptians,' Hasselquist informs us, ' have a curious manner of freeing themselves in some measure from this destructive animal. They remark the places he frequents most, and there lay a great quantity of peas: when the beast comes on shore hungry and voracious, he falls to eating what is nearest him; and, filling his belly with the peas, they occasion an insupportable thirst: he then returns immediately into the river, and drinks upon these dry peas large draughts of water, which suddenly causes his death; for the peas soon begin to swell with the water, and not long after the Egyptians find him dead on the shore, blown up as if killed with the strongest poison.' The river-horse also feeds on roots of trees, which he loosens with his great teeth; but never eats fish, as is asserted by Dampier. The hippopotami sleep in the reedy islands in the middle of the stream, and on these they bring forth their young. A herd of females has but a single male: they bring one young at a time, and that on the land, but suckle it in the water.

They are capable of being tamed. Belon says, 'he has seen one so gentle as to be let loose out of a stable and fed by its keeper, without at-tempting to injure any one.' They are generally taken in pitfalls, and the poor people eat the flesh. In some parts the natives place boards full of sharp irons in the corn grounds; which these beasts strike into their feet, and so become an easy prey. Sometimes they are struck in the water with harpoons fastened to cords, and ten or twelve canoes are employed in the chase. The hippopotamus was known to the Romans. Scaurus treated the people with the sight of five crocodiles and one hippopotamus during his ædileship, and exhibited them in a temporary lake. Augustus produced one at his triumph over Cleopatra. This animal is the behemoth of Job; who admirably describes its manners, its food, and its haunts, chap. xl. ver. 15-24. An entertaining account of the hippopotamus is given in Sparman's Voyage to the Cape of Good Hope, where these animals are called sea-cows. After giving a particular narrative of a hunting expedition, for two days, upon which he and Mr. Immelman had set out, on the 24th of January, 1776, accompanied by other three Europeans, and two Hottentots, and wherein he himself was once in imminent danger of his life from one of these animals, Mr. Sparman proceeds as follows :- " The same night (the 26th) we betook ourselves again to our posts; and at half after eight, it being already very dark, a sea-cow began at intervals to put its head up above the water, and utter a sharp, piercing, and very angry cry, which seemed to be between grunting and neighing. Perhaps this cry may be best expressed by the words heurkh, hurkh, huh-huh: the two first being uttered slowly, in a hoarse, but sharp and tremulous sound, resembling the grunting of other animals : while the third or compound word is sounded extremely quick, and is not unlike the neighing of a horse. It is true, it is impossible to express these inarticulate sounds in writing; but perhaps one may make nearer approaches to it than to the gutturo-palatial sounds of the Hottentot language. At eleven o'clock came the same or some other hippopotamus, and visited the posts we occupied. He did not, however, dare to come up, though we heard him nibble the boughs, which hung over the surface of the water, as well as a little grass and a few low shrubs, which grew on the inside of the river's banks. We were, however, in hopes, that this way of living would not long suffice animals, one of which only requires almost a larger portion than a whole team of oxen. Thus far at least is certain, that if one should calculate the consumption of provision made by a sea-cow from the size of its fauces, and from that of its body and belly, which hangs almost down to the ground, together with the quantity of grass which I have at different times observed to have been con-sumed by one of them, in spots whither it has come over night to graze, the amount would appear almost incredible. We passed the following night at the same posts, the sea-cows acting much as before. On the 28th, after sun-rise, just as we were thinking of going home to our

waggons, there comes a female hippopotamus, with her calf, from some other pit or river, to take up her quarters in that which we were then While she was waiting at a rather blockading. steep part of the river's banks, and looking back after her calf, which was lame, and came on but slowly, she received a shot in her side, upon which she directly plunged into the river, but was not mortally wounded ; for Flip, the farmer's son, the drowsiest of all sublunary beings, who had shot her, and that instant could hardly be awakened by two Hottentots, was still half asteep when he fired his piece. And happy was it for him, that the enormous beast did not make towards his hiding or rather sleeping place, and send him into the other world to sleep for ever. In the mean while his shot was so far of service, that one of my Hottentots ventured to seize the calf, and hold it fast by its hind legs, till the rest of the hunting party came to his assistance; upon which the calf was fast bound, and with the greatest joy borne in triumph to our waggons; though, while they were taking it over a shallow near the river, the Hottentots were very much alarmed, lest the wounded mother, and the other sea-cows should be induced by the cries of the calf to come to its rescue; the creature, as long as it was bound, making a noise a good deal like a hog that is going to be killed, or has got fast between two posts. The sound, however, proceeding from the hippopotamus calf was more shrill and harsh. It showed likewise a considerable share of strength in the attempt it made to get loose, and was quite unmanageable and unwieldy; the length of it being three feet and a half, and the height two feet, though the Hottentots supposed it to be no more than a fortnight, or at most three weeks old. When at last it was turned loose it ceased crying; and when the Hottentots had passed their hands several times over its nose, in order to accustom it to their effluvia, it began directly to take to them.' ' While the calf was yet alive,' he adds, 'I made a drawing of it, a copy of which may be seen in the Swedish Transactions for 1778. After this it was killed, dissected, and eaten up in less than three hours time. The reason of this quick despatch was partly the warmth of the weather, and partly our being in absolute want of any other fresh provisions. We found the flesh and fat of this calf as flabby as one might have expected from its want of age, and consequently not near so good as that of the old sea-cows; of which I found the flesh tender, and the fat of a taste like marrow, or at least not so greasy and strong as other fat. It is for this reason likewise that the colonists look upon the flesh and fat of the sea-cow as the wholesomest meat that can be eaten; the gelatinous part of the feet in particular, when properly dressed, being accounted a great delicacy. The dried tongues of these animals are also considered, even at the Cape, as a rare and savoury dish. On my return to Sweden, I had the honor to furnish his majesty's table with a dried sea-cow's tongue, two feet and eight inches long. With respect to form, the tongue of a full-grown hippopotamus is very blunt at the tip, and is in fact broadest at that part: if at the same time it is slanted off towards one side,

and marked with lobes, as I was informed it is, this circumstance may, perhaps, proceed from the friction it suffers against the teeth, towards the side on which the animal chiefly chews; at least some traces of this oblique form were discoverable on the dried tongue I am speaking of. The hide of the adult hippopotamus bears a great resemblance to that of the rhinoceros, but is rather thicker. Whips made of this hide are likewise stronger, and, after being used some time, are more pliable than those made of the hide of the rhinoceros usually are, though they are not so transparent as these latter are when new. That the hippopotamus actually lives in salt water, I have seen evident proofs at the mouths both of the Kromme and Camtour rihomewards; where many of these animals blowed themselves in broad day light, and thrust their heads up above the water; and one of them, in particular, which had been wounded by an ill-directed shot on the nose, neighed from anger and resentment. In Krakekamma I saw on the beach manifest traces of a hippopotamus which had come out of the sea, but had retired thither again directly.

'The method of catching the hippopotamus consists (besides shooting it) in making pits for it, in those parts which the animal passes, in his way to and from the river : but this method is peculiar to the Hottentots; and is only practised by them in the rainy season, as the ground in summer is too hard for that purpose. It is said that they have never succeeded in killing this huge aquatic animal with poisoned darts, though this way of killing game is practised with ad-vantage by the Hottentots for the destruction both of the elephant and rhinoceros. The hippopotamus is not so quick in its pace on land as the generality of the larger quadrupeds, though perhaps it is not so slow and heavy as M. de Buffon describes it to be; for both the Hottentots and colonists look upon it as dangerous to meet a hippopotamus out of the water; especially as, according to report, they had had a recent instance of one of these animals, which, from certain circumstances, was supposed to be in rut, having for several hours pursued a Hottentot, who found it very difficult to make his escape. Having already exceeded the limits I had prescribed to myself, I do not intend to dwell here on the anatomy of the hippopotamus we caught; particularly as the internal conformation of the calves is somewhat different from that of the adult animal. I shall therefore only briefly mention the following particulars: the stomachs were four in number, and consequently one more than in the foctus examined by M. Daubenton, which was kept in spirits. Compare Buffon, tom. xii. tab iv. fig. 2. The two first stomachs were each of them about seven inches long and three inches in diameter; the third was nine inches in length, and a little wider than the two former; the fourth was seven inches long, and at the upper part five inches broad, but decreased by degrees on one side till it terminated in the pylorus, which had an aperture an inch in width, being about half as wide again as the cardia. did not observe any such valves as M. Dauben-

ton has delineated. The first stomach was found mostly empty, it containing only a few lumps of cheese or curd ; it likewise differed from the rest by the superior fineness of its internal coat. The internal membrane of the second stomach was rather coarser, and had many small holes in it; it likewise contained several clods of caseous matter, together with a great quantity of sand and mud. The third stomach had very visible folds, both longitudinal and transversal, on the inside of it, and contained caseous lumps of a yellow color and harder consistence than the others, together with several leaves quite whole and fresh, and at the same time some dirt. The interior membrane of the fourth stomach was very smooth, though it was not without folds ; in the stomach itself there was a good deal of dirt, with a small quantity of curds, which were whiter than they were in any of the other stomachs. This fourth stomach in a great measure covered the rest, being situated on the right side of the animal, and was found to have the upper part of the melt adhering to its superior and interior edge. This latter viscus, which was one foot long and three inches broad, diverged from it downwards on the left side. The intestinal canal was 109 feet long; the liver measured fourteen inches from right to left, and seven or eight from the hind part to the fore part. On its anterior edges it had a large notch, being in other respects undivided and entire; it was of an oblique form, being broadest towards the left side, where I discovered a gall-bladder five inches in length. In the uterus there was nothing particularly worthy of observation. I found two teats, and the heart surrounded with much fat; the length of this muscle was five inches, and the breadth about four inches and a half. The communication between the auricles, called the foramen ovale, was above an inch in diameter. Each lung was eleven inches long, and undivided : but, at the superior and exterior parts of the right lung, there were two globules or processes, elevated half an inch above the surface ; and on the side corresponding to it in the left lung, and in the upper part of it, there was a little excrescence, terminating in a point : somewhat below this, yet more forwards, there was found likewise a process half an inch in height. Directly over the lower part of the communication formed between the right and left lungs, there was a kind of crest or comb, measuring an inch from the top to the basis. One of my brother sportsmen said, he had once observed a peculiar kind of vermin on the body of one of these amphibious animals; but on the calf we caught we found nothing but a species of leech, which kept only about the anus, and likewise a good way up in the straight gut, where, by a timely abstraction of the blood, they may be of use to these large amphibious animals; and particularly may act as preservatives against the piles, repaying themselves for their trouble in kind; most of them were very small; but on the other hand there was a considerable number of them. The only large one I saw of this species, being somewhat more than an inch in length, I described and made a drawing of : this is inserted by the name of the Ilirudo Capensis, corpore supra nigri-

cante, medio longitudinaliter sub-brunneo, subtus pallide fusco, in the elegant Treatise on Worms, which M. Adolphus Nodeer, first secretary of the patriotic society, is preparing for the press. Instead of the lighter colored streak upon the back, there was discoverable in some of these leeches one and sometimes two longitudinal brownish lines, which grew fainter and fainter towards the extremities. This huge animal has doubtless obtained its present name, merely in consequence of the neighing sound it makes, as otherwise in its form it bears not the least resemblance to a horse, but rather to a hog. Neither does it in the least resemble the ox; so it could be only the different stomachs of this animal which could occasion it to be called sea-cow at the Cape; and perhaps it is for the same reason that the Hottentots call it the t'gao, which nearly approaches to t'kau, the name by which the buffalo is known among these people. Mr. Maxwell, in his account of Coango, says 'I never had the good fortune to kill a hippopotamus, although I have often attempted it by muffling the oars and warily approaching them, but they always took the alarm and retreated to deep water. This inclines me to think, that one of their number stands sentinel while the others sleep. They presented, however, many oportunities of being fired at, rearing their huge heads abruptly out of the water, sometimes only a few yards from the boat, putting us under no small apprehension by their tremendous bellowing and threatening aspect. Many a volley was fired at them, but whether the hide is proof against ball, or the current carried the wounded out of our reach, we could not ascertain.

HIPPOPOTAMUS FOSSIL. Zoologists are acquainted with one living species of hippopotamus only, but late observations have proved that the bowels of the earth contain the fossil remains of two perfectly distinct species, one of which appears not to differ in any respect from the one still existing; the other being, as it were, a miniature copy of the larger, is nearly of the size of the wild boar. The discovery of this latter we owe to the indefatigable Cuvier, who has likewise proved the existence of the other species in a fossil state. Several authors, prior to that celebrated naturalist, have mentioned fossil bones of the great African hippopotamus, but subsequent observations proved that they had been rather too rash in forming their diagnosis.

Some writers, on the other hand, have been in the possession of real fossil remains of the hippopotamus without being aware of it. Thus Aldrovandus has figured several molares of this animal under the name of elephant's teeth, while the real elephant's teeth, of which he has likewise given a representation, were considered by him as belonging to some large unknown animal. The only authors who have been more correct, both in the application of the name of hippopotamus, and in their observations respecting the fossil remains of the animal in question, are Antoine de Jussieu and Daubenton; the fossil bones described by the former, as early as 1724, cannot be doubted to be really those of the river horse; and those indicated by Daubenton under the same name, and deposited (promiseuously with others, which belong to the mastodonte, in the museum at Paris, were the first that served to convince Cuvier of the existence of fossil remains of

1. The great or common hippopotamus.—Oue of the last-mentioned specimens of osseous remains, consists in a potion of the right side of the lower jaw containing two molar teeth; the other in a single molar tooth. The place where they were found is not known with certainty. A third specimen, examined by Cuvier, is a fragment of the upper jaw, with two molar teeth, in the collection of M. de Drée; it is penetrated by a ferruginous substance, but does not bear any indication of its origin; it is not, however, improbable that it was found in the neighbourhood of Montpelier.

More satisfactory than the preceding specimens, with regard to its locality, was one in the collection of M. Miot. This bone, which was known to have been gathered in the Val d'Arno, in Tuscany, is an astragalus, resembling that of a hog, to which animal the hippopotamus approaches more than to any other, with regard to the conformation of all its parts. The place where bones of the hippopotamus are actually found being thus ascertained, Cuvier applied to Fabbroni at Florence, who sent him drawings of two molar teeth, and one representing a fragment of a tusk or canine tooth, which Cuvier soon ascertained to belong to the animal in question. Respecting the canine tooth, it is observed by Fabbroni, that it differs from that of the African hippopotamus in its diameter being greater compared with its length, and also in its spiral curvature being much more distinct. He adds, that these teeth are scattered in various parts of the upper valley of Arno, but unaccompanied either by jaws or other bones. Cuvier thinks there is no material difference

Cuvier thinks there is no material difference either between these fossil teeth or the astragalas he has examined, and those of the living species; and indeed it is remarkable, that the animal, whose existence in a fossil state had at first appeared doubtful to geologists, should be one whose fossil remains far more strikingly resemble the bones of the still existing species, than any other fossil remains which naturalists have referred to living animals, such as the elephant, the rhinoceros, &c.

2. The small fossil hippopotamus.-The mass out of which Cuvier extracted the remains of this species (but the geological relation of which is unfortunately unknown), resembles the osseous breccia of Gibraltar, Dalmatia, and Cette, except that the matrix, instead of being calcareous and stalactitical, is a homogeneous sandstone, which uniformly fills up all the intervals between the hones; the bones also form a far more considerable portion of the mass than is the case in the Gibraltar rock. After having performed the difficult operation of disengaging all the separate osseous fragments, M. Cuvier found that they belonged to an animal of which no traces had hitherto been discovered, but which was unquestionably a congener of the common hippopotamus. The teeth were found to agree in all essential points with those of the other species; and the remainder of the osseous fragments, which

265

were next examined, confirmed, without a single exception, what had been indicated by the characters of the teeth.

IHPPURIS, mare's-tail; a genus of the monogynia order and monandria class of plants; natural order fifteenth, inundata: cAL none, nor any petals; the stigma is simple; and there is one seed. There are two species, one a native of Britain, and which grows in ditches and stagnant waters. The flower of this plant is found at the base of each leaf, and is as simple as can be conceived; there being neither empalement nor blossom; and only one chive, one pointal, and one seed. It is a very weak astringent. Goats eat it; cows, sheep, horses, and swine, refuse it.

HIPPUS, an affection of the eyes, that makes them represent objects in the like kind of motion as when on horseback.

IIIRAM, a king of Tyre, contemporary with Solomon, whom he supplied with cedar, gold, silver, and other materials for building the temple. He died A. A. C. 1000.

⁴ HIRAM, an artist of Tyre, who assisted in the erection of Solomon's temple, and other public buildings at Jerusalem, flourished A.A.C. 1015.

HIRCH-HORN, a town of Germany, in the circle of the Lower Rhine, with a strong castle; seated on the side of a hill on the Neckar, and in the palatinate. Mr. Crutwell places it in the electorate of Mentz, seven miles east of Heidelherg, and twelve south of Erbach. Long. 9° 0' E., lat. 49° 28' N.

HIRE, v. a. & n. s. HIRE, v. a. & n. s. HIRE'LING, n. s. & adj. Dan. hyre; Swed. HI'RER, n. s. To procure any thing for temporary use at a certain price: the price so paid to engage a servant in temporary service; the wages paid to them: to bribe; to let at a certain price: hireling one who serves for wages, in a good or bad sense; a prostitute; a venal person: hirer in Scotland is one who keeps small horses to let.

They that were full, *hired* out themselves for bread; and they that were hungry, ceased. 1 Sam. ii.

They weigh silver in the balance, and hire a goldsmith, and he maketh it a god. Isa. xlvi. 6.

From thennesforth the Jewes han conspired This innocent out of this world to chace : An homicide han they *hired*, That in an aleye had a privee place And as the child gan forthly for to pace This guessed Leng his heat set held him fort

This cursed Jew him hent and held him fast

And cut his throte and in a pit him caste. Chaucer. The Prioresses Tale.

About him lefte he no mason

That stone could laie, ne no querrour ;

He hired hem to make a tour.

Id. Romannt of the Rose.

The hireling longs to see the shades descend, That with the tedious day his toil might end, And he his pay receive. Sandys.

Great thanks and goodly meed to that good sire; He thence departing gave for his pains hire.

I cannot strike at wretched kerns, whose arms Are hired to bear their staves. Shakspears.

Spenser.

HIR

I have five hundred crowns,

The thrifty hire I saved unto your father. Id. In the framing of Hicro's ship there were three hundred carpenters employed for a year, besides many other hirelings for carriages. Wilkins's Dædalus. Though little was their hire, and light their gain,

Yet somewhat to their share he threw. Dryden.

All arts and artists Theseus could command, Who sold for *hire*, or wrought for better fame. *Id*.

'Tis frequent here to see a freehorn son On the left hand of a rich *hireling* run.

Id. Juvenal.

His sordid avarice rakes

In excrements, and hires the jakes.

Themetes first, 'tis doubtful whether hired,

Or so the Trojan destiny required,

Moved that the ramparts might be broken down.

Dryden.

Then trumpets, torches, and a tedious crew

Of hireling mourners for his funeral due. Id. Men that hire out their words and anger; that are more and less passionate, according as they are paid for it, and allow their client a quantity proportionable to the fee which they receive. Addison.

Now she shades thy evening walk with bays, No hireling she, no prostitute to praise. Pope.

HIRE (Philip de la), an eminent French mathematician and astronomer, born at Paris in 1640. His father, who was painter in ordinary to the king, designed him for the same profession: but he devoted himself to mathematical studies, and was nominated, together with M. Picard, to make the necessary observations for a new map of France, by the directions of M. Colbert. In 1633 he was employed in continuing the famous meridian line begun by M. Picard; and was next engaged in constructing the grand aqueducts projected by Louis XIV. He died in 1718, after having written a great number of works, besides several occasional papers dispersed in Journals, and in Memoirs of the Academy of Sciences. HIRPINI, in ancient geography, a people of

HIRPINI, in ancient geography, a people of Italy, next to the Samnites, to the south-east and descendants from them; situated to the north of the Picentini, and to the west of the Apuli, having on the north the Appennines and a part of Samnium. The name is from Hirpus, a term denoting in their language a wolf; either because under the conduct of this animal the colony was led and settled, according to Strabo; or because, like that prowling animal, they lived on plunder, according to Servius,

HIRSCHBERG, a town of Silesia, in the principality of Jauer, famous for its trade and manufactures. In 1549 it was burnt; in 1633 pillaged by the Saxons; and in 1634 burnt by the Imperialists. It is twenty-two miles southeast of Buntzlau.

HERSCHBERG, a well-built commercial town in the principality of Jauer, Silesia, at the confluence of the Bober and the Zacke. It is the chief place of a circle, and contains 6000 inhabitants, chiefly Lutherans. The support of the inhabitants is chiefly a trade in linen, and fine lawn; here are also some woollen manufactures. This town was burnt down in 1549; in 1633 it was pillaged by the Saxons; and in 1634 again burned by the Imperial troops. It is twenty-three miles W.S.W. of Jauer, and thirtyfive west of Schweidnitz.

HIRSCHFELD, or HERSFELD, a southern district and town of Hesse-Cassel. The district is 168 square miles in extent, with a population of 22,000, and divided into eight bailiwics : it is in general very fertile, but in part covered with wood. The town is walled and situated on the Fulda, which is here navigable. It contains 5500 inhabitants, and has a well regulated Calvinistic gymnasium. It has also some manufactures of cloth and leather. Twenty-five miles north of Fulda.

HIRSCHING (Frederic Charles Gottlob), a learned German professor, was born at Uffenheim, December 21st, 1762. He had been nominated supernumerary professor of philosophy at Erlangen, but had scarcely at his death entered on the functions of his office. He is chiefly known for his researches on history and geography. His best works are-A Description of the Principal Libraries of Germany, Erlangen, 1786, 4 vols. 8vo.; An Account of the most Curious Pictures, and collections of Engravings, 6 vols. 8vo.; and A Dictionary of Celebrated Persons of the Eighteenth Century, continued after his death by J. II. M. Ernesti and others, at Co-Hirsching's portion of the work consists bourg. of the first five volumes. He died at Erlangen, March 11th, 1800.

HIR'SUTE, adj. Latin hirsutus. Rough; rugged.

There are bulbous, fibrous, and *hirsute* roots: the *hirsute* is a middle sort, between the bulbous, and fibrous; that, besides the putting forth sap upwards and downwards, putteth forth in round. *Bacon.*

HIRTELLA, in botany, a genus of the monagynia order; and pentandria class of plants. There are five petals; the filaments are very long, persisting and spiral; the berry is monospermous; the style lateral. Species four; natives of Guiana and the West Indies.

HIRUDO, the leech, a genus of insects belonging to the order of vermes intestinæ. The body moves either forward or backward. There are several species, principally distinguished by their color. The most remarkable are the following:--

H. geometra, the geometrical leech, grows to an inch and a half in length; and has a smooth and glossy skin of a dusky-brown color but in some seasons greenish spotted with white. When in motion its back is elevated into a kind of ridge; and it then appears as if measuring the space it passed over like a compass, whence its name. Its tail is remarkably broad; and it holds as firmly by it as by the head. It is common on stones in shallow running waters; and is often found on trouts and other fish after spawning time.

H. medicinalis, the medicinal leech, the form of which is well known, grows to the length of two or three inches. The body is of a blackishbrown color, marked on the back with six yellow spots, and edged with a yellow line on each side; but both the spots and the lines grow faint, and almost disappear, at some seasons. The hcad is smaller than the tail, which fixes itself very firmly to any thing the creature pleases. It is viviparous, and produces but one young one at a time, which is in July. It is an inhabitant of

Id.

clear running waters, and is well known for its use in bleeding. The leech's head is armed with a sharp instrument that makes three wounds at once. It consists of three sharp tubercles, strong enough to cut through the skin of a man, or even of an ox or horse. The mouth is as it were the body of the pump, and the tongue or fleshy nipple the sucker; by the working of this piece of mechanism, the blood is made to rise up to the conduit which conveys it to the animal's stomach, which is a membranaceous skin divided into twenty-four small cells. The blood which is sucked out is there preserved for several months almost without coagulating, and proves a store of provision to the animal. The nutritious parts, pure and already digested by animals, require not to be disengaged from the heterogeneous substances : nor indeed is there any thing like an anus discoverable in the leech ; mere transpiration seems to be all that it performs, the matter fixing on the surface of its body, and afterwards coming off in small threads. Of this an experiment may be tried by putting a leech into oil, where it keeps alive for several days; upon being taken out and put into water, there appears to loosen from its body, a kind of slough shaped like the creature's body. The organ of respiration seems to be situated in the mouth; for if, like an insect, it drew its breath through vent holes, it would not subsist in oil, as by it they would be stopped up. This is the only species that is used in medicine; being applied to the skin to draw off blood. If the leech does not fasten, a drop of sugared milk is put on the spot it is wished to fix on, or a little blood is drawn by means of a slight puncture, after which it immediately settles. The leech when fixed should be watched, lest it should find its way into the anus when used for the hemorrhoids, or penetrate into the œsophagus if employed to draw the gums; otherwise it would make great havock in the stomach or intestines. In such a case, the best and quickest remedy is to swallow some salt; the application of which makes it quit its hold when it sucks longer than is intended. Salt of tartar, volatile alkali, pepper, and acids, make it also leave the part on which it was applied. Cows and horses have been known to receive them in drinking into the throat. The usual remedy is to force down some salt, which makes them fall off. If, on the contrary, it is intended that the leech should draw a larger quantity of blood, the end of its tail is cut off; and it then sucks continually to make up the loss it sustains. The discharge occasioned by the puncture of a leech is usually of more service than the process itself. When too abundant, it is easily stopped with brandy, vinegar, or other styptics, or with a compress of dry linen rag bound strongly on the bleeding orifice.

II. muricata, the muricated leech, has a taper body, rounded at the greater extremity, and furnished with two small tentacula, or horns, strongly annulated and rugged upon the rings, the tail dilated. It inhabits the Atlantic Ocean, and is by the fishermen called the sea-leech. It adheres to fish, and generally leaves a black mark on the spot.

H. sangui-suga, the horse-leech, is of a larger

size than the medicinal leech. Its skin is smooth and glossy; the body is depressed; the back is dusky; and the belly is of a yellowish-green, having a yellow lateral margin. It inhabits stagnant waters. At Ceylon, travellers who walk bare-legged are molested by the great numbers of leeches concealed under the grass. All leeches vary in their color at some seasons, but they are generally of a dusky greenish-brown or yellow, and often variegated. They are very restless before a change of weather, if confined in glasses. They suck blood with greater avidity than the medicinal, and are dangerous to apply to the skin for that reason.

HIRUNDO, in ornithology, a genus of birds of the order of passeres. There are numerous species, chiefly distinguished by their color. The most remarkable are the following :--

1. II. ambrosiaca, the ambergris swallow. It is about the size of a wren, with a gray plumage and a very forked tail; the bill is blackish, and the legs are brown. It inhabits Senegal, and is said to smell very strong of ambergris.

1. II. apus, the swift, is a large species, being nearly eight inches long, with an extent of wing nearly eighteen inches, though the weight of the bird is only one ounce. Their feet are so small, that the action of walking and rising from the ground is extremely difficult, but they have full compensation, being furnished with ample means for an easy and continual flight. It is more on the wing than any other swallow; its flight is more rapid, and that attended with a shrill scream. It rests by clinging against some wall, or other apt body: whence Klein styles this species hirundo muraria. It breeds under the eaves of houses, in steeples, and other lofty buildings; and makes its nest of grasses and feathers. Its feet are of a particular structure, all the toes standing forward : the least consists of only one bone; the others of an equal number, viz. two each; in which they differ from those of all other birds; a construction, however, nicely adapted to the purposes in which their feet are employed. The swift is a summer inhabitant of these kingdoms. It comes the latest, and departs the soonest, of any of the tribe; not always staying till the middle of August, and often not arriving before the beginning of May. A pair of these birds were found adhering by their claws, and in a torpid state, in February 1766, under the roof of Longnor Chapel, in Shropshire; on being brought to a fire, they revived, and moved about in the room. The materials of its nest it collects either as they are carried about by the winds, or picks them up from the surface in its sweeping flight. Its food is undeniably the insects that fill the air. Its drink is taken in transient sips from the water's surface. Even its amorous rites are performed on high. The swift is a most alert bird, rising very early and retiring to roost very late; and is on the wing in the height of summer at least sixteen hours. In the longest days it does not withdraw to rest till nine in the evening, being the latest of all day birds. Just before they retire whole groups of them assemble high in the air, and squeak, and shoot about with wonderful rapidity. But this bird is never so much alive as in sultry thundery

weather, when it expresses great alacrity, and calls forth all its powers. When the hen has sat hard all day, she rushes forth just as it is almost dark, and stretches and relieves her weary limbs, and snatches a scanty meal for a few minutes, and then returns to her duty of incubation. Swifts, when wantonly shot while they have young, discover a little lump of insects in their mouths, which they pouch and hold under their tongue. In general, as already observed, they feed in a much higher district than the other species; they also range to vast distances; since locomotion is no labor to them, who are endowed with such wonderful powers of wing. At certain times in the summer, however, they have been observed hawking very low for hours together over pools and streams; and, upon enquiring into the object of their pursuit that induced them to descend so much below their usual range, it has been found that they were taking phryganeæ, ephemeræ, and libellulæ (cadew-flies, may-flies, and dragon-flies), that were just emerged out of their aurelia state. They are out all day long, even though wet, feeding, and disregarding the rain. But windy weather, and particularly with heavy showers, they dislike; and on such days withdraw, and are scarcely ever seen. 'There is a circumstance respecting the color of swifts,' Mr. White remarks, ' which seems not to be unworthy our attention. When they arrive in the spring, they are all over of a glossy dark soot color, except their chins, which are white; but, by being all day long in the sun and air, they become quite weather-beaten and bleached before they depart, and yet they return glossy again in the spring. Now if they pursue the sun into lower latitudes, as some suppose, in order to enjoy a perpetual summer, why do they not return bleached? Do they not rather perhaps retire to rest for a season, and at that juncture moult and change their feathers, since all other birds are known to moult soon after the season of breeding? Swifts are very anomalous in many particulars, dissenting from all their congeners not only in the number of their young, but in breeding once in a summer; whereas all the other British hirundines breed invariably twice. They retire, as to the main body of them, by the 10th of August, and sometimes a few days sooner; and every straggler invariably withdraws by the 20th, while their congeners, all of them, stay till the beginning of October; many through all that month, and some occasionally to the beginning of November. This early retreat is mysterious and wonderful, since that time is often the sweetest season in the year. But, what is more extraordinary, they begin to retire still earlier in the most southerly parts of Andalusia, where they can be no ways influenced by any defect of heat; or, as one might suppose, defect of food. Are they regulated in their motions with us by a failure of food, or by a propensity to moulting, or by a disposition to rest after so rapid a life, or by what? This is one of those incidents in natural history, that not only baffles our searches, but almost eludes our guesses. Swifts never perch on trees or roofs, and so never congregate with their congeners. They are fearless while haunt-

ing their nesting places, and are not to be scared with a gun; and are often beaten down with poles and cudgels as they stoop to go under the eaves. Swifts are much infested with those pests to the genus called hippoboscæ hirundinis; and often wriggle and scratch themselves in their flight, to get rid of that clinging annoyance. And young ones, overrun with these insects, are sometimes found under their nests, fallen to the ground; the number of vermin rendering their abode insupportable. The Swedes have bestowed a very pertinent name on this swallow, calling it ring-swala, from the perpetual rings or circles that it takes round the scene of its nidification. As these birds are apt to catch at every thing on the wing, many have taken them by a bait on a cock-chafer tied to a thread, which they have swallowed as freely as a fish theirs. In the Isle of Zant the boys are said to get on an elevated place, and, merely with a hook baited with a feather, have caught five or six dozen of them in a day. Besides our island, the swift is known to inhabit the whole of the European continent; and has also been noticed at the Cape of Good Hope, and Carolina in North America. Hence, most likely, it is a general inhabitant of both the old and new continents.

3. H. borbonica, the wheat swallow, is about the size of the swift : the plumage above is blackish brown; beneath gray, marked with longitudinal brown spots : the tail is even at the end : the bill and legs are black. This species inhabits the Isle of France; frequenting places sown with wheat, and glades of woods; affecting elevated situations, and frequently seen perched on trees and stones. It follows herds of cattle for the sake of the flies that surround them ; and is frequently seen in the wake of ships in great numbers, in the road near the isle, for the same purpose. It is often observed in the evenings about the clefts in the mountains, where it is said to pass the night, and where it makes its nest; which is composed of straw and feathers. It lays two eggs, of a gray color, dotted with brown.

4. H. Cayennensis, the white-colored swallow, is about the size of the martin: the head and bill are black; the chin and throat white, passing from the last in a narrow collar round the neck; between the bill and eye is a streak of white, which forks off into two, one passing a little above, and the other a little way beneath the eye; the rest of the plumage is black, with a gloss of violet; but the greater coverts, nearest the body, are brown edged with white: the quills and tail are black, the last forked; the legs are black, and all the four toes placed before, as in the swift, and covered with feathers to the claws. This bird makes its nest in the houses at Cayenne. It is of a large size, in shape of a truncated cone; five inches one way by three the other, and nine inches in length. It is composed of the down of dog's bane, well woven together; the cavity divided obliquely about the middle, lengthways, by a partition, which spreads over that part of the nest where the eggs lie, which is pretty near the base : a small parcel of the same soft down, forming a kind of plug, is placed over the top, serving to keep the young

brood from the impression of the air; whence we may suppose them to be very tender.

6. H. esculenta, the edible swallow, is of a blackish-gray color, inclining a little to green; but on the back to the tail, as well as on the belly, this blackish color gradually changes into a mouse color. The whole length of the bird, from the bill to the tail, is about four inches and a half, and its height from the bill to the extremity of the middle toe three and a quarter. The distance from the tip of the one wing to that of the other, when extended, is ten and a quarter. The largest feathers of the wing are about four inches in length. The head is flat; but, on account of the thickness of the feathers, appears round, and to be of a large size in proportion to the rest of the body. The bill is broad, and ends in a sharp extremity, bent downwards, in the form of an awl. The width of it is increased by a naked piece of skin, somewhat like parchment, which, when the bill is shut, lies folded together; but which, when the bill opens, is considerably extended, and enables the bird to catch with greater ease, while on wing, the insects which serve it for food. The eyes are black, and of a considerable size. The tongue, which is not forked, is shaped like an arrow. The ears are flat, round, naked spots, with small oblong openings, and are entirely concealed under the feathers of the head. The neck is very short, as well as the legs and bones of the wings. The thighs are wholly covered with feathers, and the very tender lower parts of the legs, and the feet themselves, are covered with a skin like black parchment. Each foot has four toes, three of which are before, and one turned backwards. They are all detached from each other to the roots; and the middle one, together with the claw, is fully as long as the lower part of the leg. Each toe is furnished with a black, sharp, crooked claw, of a considerable length, by which the animal can, with great facility, attach himself to crags and rocks. The tail is fully as long as the body together with the neck and the head. When extended it is in the form of a wedge, and consists of ten large feathers. The first four on each side are long; and, when the tail is closed, extend almost an inch beyond the rest. The other feathers decrease towards the middle of the tail, and are equal to about the length of the body. But the most curious part of the natural history of this bird consists in the nest, which is composed of such materials as render it not only edible, but one of the greatest dainties of the Asiatic epicures. These nests are found in vast numbers in certain caverns, in various isles in the Sooloo Archipelago, situated between long. 117° and 120°, and lat. 5° and 7°, particu-larly in three small isles, or rather rocks; in the caverns of which the nests are found fixed to the stones in astonishing numbers. They are also found in amazing quantities on a small island called Toc, in the straits of Sunda, the caverns of which are lined with the nests; but no where in greater abundance than about Croee, near the south end of Sumatra, four miles up a river of that name. But they are not peculiar to the above places; for they are likewise common from Java to Cochinchina on the north, and from

the point of Sumatra west, to New Guinea on the east, where the sea is said to be covered with a viscous substance like half-melted glue, which the bird is supposed either to take up from the surface with its bill during flight, or to pick from the rocks when left there by the waves Of these nests, it is said, the Dutch alone export from Batavia 1000 pickles, upwards of 1300lbs. English weight, every year, which are brought from the Isles of Cochinchina, and those lying to the east of them. It is surprising that, among other luxuries imported from the east, these nests should not have found a way to our tables; being yet so scarce in England as to be kept as rarities in the cabinets of collectors. The bird itself at Sumatra is called layonglayong.

H. melba, the white-bellied swift, is in length eight inches and a half, and weighs 2 oz. 4 dr.; the bill is half an inch long, somewhat bent, and black : the upper parts of the body are of a gray brown; the wings and tail deepest, with a gloss of red and green in some lights: the throat, breast, and belly, are white; on the neck is a collar of gray brown, mixed with black: the sides are dusky, and white mixed; lower part of the belly and under tail-coverts the same as the back : the legs are flesh-colored, and covered with feathers on the fore part and inside : all the toes are placed forward, as in our swift. This bird inhabits the mountainous parts of Spain; building in the holes of rocks. It is found also on the borders of the Rhone, in Savoy, the isle of Malta, Alps of Switzerland, and rock of Gibraltar. It comes into Savoy the beginning of April, and frequents the ponds and marshes for fifteen or twenty days; after which it retires to the mountainous parts to breed. It flies higher than our swift; but feeds on the same food, and its flesh is accounted a delicate morsel. This species is not numerous. Scopoli says it builds on the summit of the mountains of Tyrol.

H. nigra, the black swallow, measures nearly six inches in length: the color of the bird is wholly black, and the tail is forked. It inhabits St. Domingo and Cayenne; but it is not numerous. It is often seen to perch on dead trees: and only inhabits dry savannahs inland. It scoops out a hole in the earth, half a foot long, with the mouth, very small, so as just to permit entrance: in this cavity it constructs the nest and rears its young.

II. purpurea, the purple swallow, is in length seven inches, and the whole body is of a deep violet, very glossy: the quills and tail are of the same color, but still deeper, and the last forked : the legs and claws are blackish, and the bill is black. The color of the female is dusky brown, with a slight tinge of violet. This species is found in summer in Carolina and Virginia: coming in May, and retiring at the approach of winter. The people are very fond of them, and make little conveniencies of boards on the outsides of their houses for the birds to build in, as is done for sparrows in England; being desirous to keep them near, as they are of much use in alarming the poultry of the approach of the hawk and other birds of prey; not only shrieking violently on the appearance of these enemies, but attack

ing them with all the efforts of our martins in Europe.

H. riparia, the sand martin, or shore bird, is four inches and three-quarters in length, with the whole upper parts of the body of a mouse-color, the throat and under parts white, the bill and legs blackish. It is common about the banks of rivers and sand-pits, where it terebrates a round and regular hole in the sand or earth, which is serpentine, horizontal, and about two feet deep. At the inner end of this burrow does the bird deposit, in a good degree of safety, her rude nest, consisting of fine grasses and feathers, usually goose-feathers, very inartificially laid together. 'Though at first,' says Mr. White, 'one would be disinclined to believe that this weak bird, with her soft and tender bill and claws, should ever be able to bore the stubborn sand-bank without entirely disabling herself; yet with these feeble instruments have I seen a pair of them make great despatch; and could remark how much they had scooped that day by the fresh sand which ran down the bank, and was of a different color from that which lay loose and bleached in the sun. In what space of time these little artists are able to mine and finish these cavities, I have never been able to discover; but it would be a matter worthy of observation, where it falls in the way of any naturalist to make his remarks. One thing is remarkable-that, after some years, the old holes are forsaken and new ones bored ; perhaps because the old habitations grow foul and fetid from long use, or because they may so abound with fleas as to become untenantable. This species of swallow is strangely annoyed with fleas; and we have seen fleas, bed fleas (pulex irritans), swarming at the mouths of these holes, like bees on the stools of their hives. The sand martin arrives much about the same time with the swallow; and lays, as she does, from four to six white eggs. But as this species is cryptogame, carrying on the busines of nidification, incubation, and the support of its young in the dark, it would not be easy to ascertain the time of breeding, were it not for the coming forth of the broods, which appear much about the time, or rather somewhat earlier than those of the swallow. The nestlings are supported in common like those of their congeners, with gnats and other small insects; and sometimes they are fed with libellulæ (dragon flies) almost as long as themselves. This hirundo is said to lay only once in a year, and to produce its young more early than the rest of its tribe : though, from this last circumstance, it would seem probable that they breed at least a second time, like the housemartin and swallow. It does not always take pains to make a hole for a nest; frequently laying in cavities of quarries, and in hollows of trees, where it is convenient. When they happen to breed near hedges and inclosures they are often dispossessed of their breeding-holes by the house sparrow, which is on the same account a fell adversary to house martins. These hirundines are no songsters, but rather mute, making only a little harsh noise when a person approaches their nests. They seem not to be of a sociable turn, never with us congregating with their congeners in the autumn. They have a

peculiar manner of flying; flitting about with odd jerks and vacillations, not unlike the motions of a butterfly. Doubtless the flight of all hirundines is influenced by, and adapted to, the peculiar sort of insects which furnish their food.

H. rustica, the common or chimney swallow, is distinguished from all the other species by the superior forkiness of its tail, and by the red spot on the forehead and under the chin. The crown of the head, the whole upper part of the body, and the coverts of the wings, are black, glossed with a rich purplish blue, and most respleadent in the male: the breast and belly white, and in the male tinged with red : the tail is black ; the two middle feathers are plain, the others marked transversely near the ends with a white spot. the exterior feathers of the tail are much longer in the male than in the female. The food is the same with that of all the genus; viz. insects. For taking these, in their swiftest flight, their parts are admirably contrived ; the r mouths are very wide to take in flies, &c., in their quickest motions; their wings are long, and adapted for distant and continual flight : and their tails are forked, to enable them to turn the readier in pursuit of their prey. This species is the first comer of all the British hirundines; and appears in general on or about the 13th of April, though now and then a straggler is seen much earlier. This species, though called the chimney swallow, by no means builds altogether in chimneys, but often in barns and out-houses against the rafters; as Virgil long ago remarked, (Georg. lib. iv. 306). In Sweden she builds in barns, and is called ladw swala, the barn swallow. In the warmer parts of Europe, where there are no chimneys to houses except they are English built, she constructs her nest in porches, gateways, galleries, and open halls. But in general, with us, this species breeds in chamneys; and haunts those stacks where there is a constant fire, for the sake of warmth; generally prefering one adjoining to the kitchen, and disregarding the perpetual smoke of that funnel. Five or six or more feet down the chimney does this little bird begin to form her nest about the middle of May, which consists, like that of the house martin, of a crust or shell composed of dirt or mud, mixed with short pieces of straw to render it tough and permanent; with this difference, that, whereas the shell of the martin is nearly hemispheric, that of the swallow is open at the top, and like half a deep dish. This nest is lined with fine grasses, which are often collected as they float in the air. Wonderful is the address (Mr. White observes) which this adroit bird shows all day long in ascending and descending through so narrow a pass. When hovering over the mouth of the funnel, the vibration of her wings acting on the confined air occasions a rumbling noise like thunder. It is probable that the dam submits to this inconvenient situation, so low in the shaft, in order to secure her brood from rapacious birds, and particularly from owls, which frequently fall down chimneys, perhaps in attempting to get at these This bird lays from four to six white nestlings. eggs, dotted with red specks; and brings out her first brood about the last week in June, or the first in July. The progressive method by which the young are introduced into life is very curious: First, they emerge from the shaft with difficulty enough, and often fall down into the room below : for a day or so they are fed on the chimney top, and are then conducted to the dead leafless bough of some tree, where, sitting in a row, they are attended with great assiduity, and may then be called perchers. In a day or two more they become fliers, but are still unable to take their own food: therefore they play about near the place where the dams are hawking for flies; and when a mouthful is collected, at a certain signal given, the dam and the nestling advance, rising towards each other, and meeting at an angle; the young one all the while uttering such a little quick note of gratitude and complacency, that one must have paid very little regard to the wonders of Nature, who has not remarked this feat. The dam betakes herself immediately to the rearing of a second brood, as soon as she is disengaged from her first; which she at once associates with the first broods of house martins; and with them congregates, clustering on sunny roofs, towers, and trees. She brings out her second brood towards the middle and end of August. Every species of hirundo drinks as it flies along, sipping the surface of the water; but the swallow only washes on the wing, by dropping into a pool for many times together; in very hot weather house martins and bank martins dip and wash a little. The swallow is a delicate songster, and in soft sunny weather sings both perching and flying, on trees in a kind of concert, and on chimney tops: it is also a bold flier, ranging to distant towns and commons even in windy weather, which the other species seem much to dislike ; nay, even frequenting seaport towns, and making little excursions over the salt-water. Horsemen on wide downs are often closely attended by a little party of swallows for miles together, which play before and behind them, sweeping around, and collecting all the sculking insects that are roused by the trampling of the horses' feet: when the wind blows hard, without this expedient, they are often forced to settle to pick up their lurking prey. This species feeds much on little coleoptera, as well as on gnats and flies; and often settles on dug ground, or paths, for gravel to grind and digest its food. Mr. Pennant says, that, for a few days previous to their departure, they assemble in vast flocks on house-tops, churches, and trees, from whence they take their flight. They are supposed to take up their winter quarters in Senegal and parts adjacent; and seem to possess in turn the whole of the old continent, being known from Norway to the Cape of Good Hope on the one hand, and from Kamtschatka to India and Japan on the other. They are also found in all parts of North America, migrating north and south as with us. Kalm says, that in America they build in houses and under the outsides of the roofs; also on the mountains, in such parts of them as project beyond the bottom, as well as under the corners of perpendicular rocks.

12. H. urbica, the martin, is inferior in size to the chimney swallow, and its tail much less

forked. The head and upper part of the body, except the rump, are black glossed with blue: the breast, belly, and rump are white; the feet are covered with a short white down. 'They begin to appear about the 16th of April; and for some time they in general pay no attention to the business of nidification : they play and sport about, either to recruit from the fatigue of their journey, if they do migrate at all; or else that their blood may recover its true tone and texture after it has been so long benumbed by the severities of winter. About the middle of May, if the weather be fine, the martin begins to think in earnest of providing a mansion for its family. The crust or shell of this nest seems to be formed of such dirt or loam as comes most readily to hand, and is tempered and wrought together with little bits of broken straws to render it tough and tenacious. As this bird often builds against a perpendicular wall, without any projecting ledge under, it requires its utmost efforts to get the first foundation firmly fixed, so that it may safely carry on the superstructure. On this occasion the bird not only clings with its claws, but partly supports itself by strongly inclining its tail against the wall, making that a fulcrum; and, thus steadied, it works and plasters the materials into the face of the brick or stone. But then, that this work may not, while it is soft and green, pull itself down by its own weight, the provident architect has prudence and forbearance enough not to advance her work too fast; but by building only in the morning, and by dedicating the rest of the day to food and amusement, gives it sufficient time to dry and harden. About half an inch seems to be a sufficient layer for a day. By this method, in about ten or twelve days, is formed an hemispheric nest, with a small aperture towards the top, strong, compact, and warm; and perfectly fitted for all the purposes for which it was intended. But then nothing is more common than for the house sparrow, as soon as the shell is finished, to seize on it as its own, to eject the owner, and to line it after its own manner. After so much labor is bestowed in erecting a mansion, as nature seldom works in vain, martins will breed on for several years together in the same nest, where it happens to be well sheltered and secure from the injuries of the weather. The shell or crust of the nest is a sort of rustic work, full of knobs and protuberances on the outside : nor is the inside of those that I have examined smoothed with any exactness at all; but it is rendered soft and warm, and fit for incubation, by a lining of small straws, grasses, and feathers; and sometimes by a bed of moss interwoven with wool. In this they tread or engender frequently during the time of building; and the hen lays from three to five white eggs. At first, when the young are hatched, and are in a naked and helpless condition, the parent birds, with tender assiduity, carry out what comes from their young. Were it not for this affectionate cleanliness, the nestlings would soon be burnt up and destroyed in so deep and hollow a nest, by their own caustic excrement. As soon as the young are able to shift for themselves, the dams immediately turn their thoughts

to the business of a second brood: while the first flight, shaken off and rejected by their nurses, congregate in great flocks, and are the birds that are seen clustering and hovering, on sunny mornings and evenings, round towers and steeples, and on the roofs of churches and houses. These congregatings usually begin to take place about the first week in August; and therefore we may conclude that by that time the first flight is pretty well over. Martins love to frequent towns, especially if there are great lakes and rivers at hand. They are by far the least agile of the British hirundines; their wings and tails are short, and therefore they are not capable of such surprising turns, and quick and glancing evolutions, as the swallow. Accordingly, they make use of a placid easy motion, in a middle region of the air, seldom mounting to any great height, and never sweeping long together over the surface of the ground or water. They do not wander far for food; but affect sheltered districts, over some lake, or under some hanging wood, or in some hollow vale, especially in windy weather. They breed the latest of all the swallow kind; in 1772 they had nestlings until October the **2**1st, and are never without young as late as Michaelmas. As the summer declines, the congregating flocks increase in numbers daily, by the constant accession of the second broods; till at last they swarm in myriads upon myriads round the villages on the Thames, darkening the face of the sky as they frequent the aits of that river, where they roost. They retire in vast flocks together about the beginning of October; but have appeared of late years in a considerable flight in this neighbourhood, for one day or two, as late as November the 3rd and 6th, after they were supposed to have been gone for more than a fortnight. They therefore withdraw, with us, the latest of any species. Unless these birds are very short-lived indeed, or unless they do not return to the district where they are bred, they must undergo vast devastations somewhere; for the birds that return yearly bear no manner of proportion to the birds that retire.

HIS, Pronoun possessive. Saxon byr. The masculine possessive pronoun of he, anciently used in a neutral sense, where we now say its. It is sometimes used as a sign of the genitive case; as, the man his ground, for the man's ground. It is now rarely thus used, as its use proceeded probably from a false opinion that the s formative of the genitive case was his contracted. Sometimes used in opposition to this man's; anciently before self.

Of his linage am I and his ofspring By veray line, as of the stok real; And now I am so caitif and so thral, That he that is my mortal enemy I serve him as his squierly pourely.

Chaucer. The Knightes Tale.

Who can impress the forest, bid the tree Unfix his earth-bound root?

Shakspeare. Macbeth.

Were I a king,

I should cut off the nobles for their lands, Desire his jewels, and this other's house.

Shakspeare.

England his approaches makes as herce As waters to the sucking of a gulph.

Id. Henry V.

Opium loseth some of *his* poisonous quality if it be vapoured out, mingled with spirit of wine.

Bacon, Where is this mankind now? who lives to age Fit to be made Methusalem his page? Donne.

Every of us, each for his self, laboured how to recover him, Sidney.

This rule is not so general, but that it admitteth his exceptions. Carew's Survey of Cornwall.

Thus while he spake, each passion dimmed his face,

Thrice changed with pale ire envy and despair;

Which marred his borrowed visage and betrayed

Him counterfeit. Milton's Paradise Lost. His mind secure does the vaiu stroke repeat,

And finds the drums Lewis's march did beat.

Marvell.

Whene'er I stoop he offers at a kiss; And when my arms I stretch, he stretches his. Addison.

As the wood-pigeon coos without his mate, So shall my doleful dirge bewail her fate. Gay.

By thy fond consort, by thy father's cares, By young Telemachus his blooming years. Pope.

' Let man's own sphere,' said he, ' confine his view ; Be man's peculiar work his sole delight.' Beattie.

HISINGEN, an island in the south-west of Sweden, at the mouth of the large river Gotha-Elf, on which the town of Gottenburg was first built. It is about sixteen miles long and six broad. Long. 11° 4' 8" E., lat. 57° 45' N.

HISPA, in zoology, a genus of insects belonging to the coleoptera order, the characters of which are these :- The antennæ are fusiform, growing gradually larger from each extremity towards the middle, and are situated between the eyes: the thorax and elytra are covered with protuberances or spines. The H. atra, found in Britain, is all over of a deep unpolished black, and has the upper part of its body entirely covered with long and strong spines, which render it bristly like the shell of a chestnut. There is even a spine at the case of the antennæ; the thorax has a row set transversely, which are forked; and the elytra are furnished with a very great number that are single. Its being thus covered with spines makes it resemble a hedgehog in miniature. It is rather difficult to catch, letting itself fall down on the ground as soon as approached. It bears its antennæ upright before it. See ENTOMOLOGY.

HISPALIS, in ancient geography, a town of Bætica, in Hispania Ultra, an ancient mart or trading town on the Bætis, navigable quite up to it for ships of burden, and thence to Corduba for river barges. It was also called Colonia Romulensis. It had a conventus juridicus, a court of justice or assizes. It is now called Seville.

HISPANIA, in ancient geography, a country or kingdom of Europe, now called Spain; called Hesperia Ultima by Horace, because the westmost part of Europe; also Iberia, from the river Iberus. Its name Hispania, or $\Sigma \pi \alpha \nu i \alpha$, is of Phœnician original, from its great number of rabbits; the Phœnicians, who settled several colonies on the coast, calling it Spanjah, from these animals. It has the sea on every side, except on that next to Gaul, from which it is separated by the Pyrenees. The Romans first divided it into Hispania Citra and Ultra under two prætors. In that state it continued down to Augustus; who divided the Farther Spain into Bætica, which he left to the people to be governed by a proconsul; and Lusitania, which he added to his own provinces; calling the Hither Spain Tarraconensis. Hispania was anciently much celebrated for its fertility, of which it has greatly fallen short in modern times. Strabo says, the people were of a warlike turn; and, tneir bodies being formed for hardships and labor, they ever preferred war to peace, and were remarkably prodigal of life. See SPAIN.

¹ HIŠPANIOLA, or St. Domingo, the largest of the Antilles or Caribbee Islands, in the West Indies. See DOMINGO (St.)

dies. See DOMINGO (SL) HISS, v.a., v.n., & n. s. Sax. bircean, to HISS, interj. Scontemn; Dut. hissen. To utter a noise like that of a serpent and some other animals. It is remarkable, that this word cannot be pronounced without making the noise which it signifies. To condemn at a public execution; to explode; to procure disgrace : hiss, the

voice of a serpent; censure; an expression of contempt, or disapprobation, as used in theatres: hist, an exclamation commanding silence. 'Of this word I know not the original: some have thought it a corruption of hush, hush it, husht, or hist; but I have heard that it is an Irish verb commanding silence.'—Dr. Johnson.

Every one will hiss him out to his disgrace.

Ecclus. xxii. 2.

Id.

The merchants shall *hiss* at thee. *Ezek.* xxvii. 36. Men shall pursue with merited disgrace;

Hiss, clap their hands, and from his country chace. Sandys.

Thy mother plays, and I

Play too; but so disgraced a part, whose issue Will hiss me to my grave.

Shakspeare. Winter's Tale. What's the newest grief?

-That of an hour's age doth hiss the speaker,

Each minute teems a new one. Id. Macbeth. In the height of this bath to be thrown into the Thames and cooled glowing hot, in that surge, like a horse shoe; think of that; *hissing* hot. Shakspeare.

Mute silence hist along !

'Less Philomel will deign a song,

In her sweetest saddest plight. Smoothing the rugged brow of night.

Smoothing the rugged brow of night. Milton. He hiss for hiss returned, with forked tongue

To forked tongue.

He heard

On all sides from innumerable tongues,

A dismal universal hiss, the sound Of publick scorn !

She would so shamefully fail in the last act, that instead of a plaudite she would deserve to be *hissed* off the stage. More.

I have seen many successions of men, who have shot themselves into the world, some bolting out upon the stage with vast applause, and others *hissed* off, and quitting it with disgrace. Dryden.

See the furies arise :

See the snakes that they rear,

How they hiss in their hair.

Id. Alexander's Feast. Against the steed he threw

His forceful spear, which, hissing as it flew.

Pierced through the yielding planks. Dryden. Vol. XI. HIS

Fierce champlon fortitude, that knows no fears

Of hisses, blows, or want, or loss of ears. Pore. Hist, hist, says another that stood by, away, do -

tor; for here's a whole pack of dismals coming. Swift.

With penitential aspect as they pass, All point at earth, and hiss at human pride,

273

The wisdom of the wise, and prancings of the great. Young.

Beattie.

Thither with one consent they hend, Their sorrows with their lives to end, While each in thought already hears The water *hissing* in his ears.

HISSAR FEROZEH, a flat district of Delhi, Hindostan, situated between the twenty-eighth and thirtieth degrees of northern latitude, on the western side of the river Jumna. The only natural stream which runs through it is the small river Sursutty; and, in order to supply this deficiency, one of the Afghaun emperors of the fourteenth century caused two canals to be cut; the first from the Setlege, the other from the Jumna, both of which joined at the town of Hissar, whence they are supposed to have been divided into a number of small cuts. Thus a part of the district received the name of Harriana, up; but the country produces horses, camels, and cattle; and during the prosperous period of the Mogul empire it was considered as the personal estate of the heir apparent. Various petty chiefs now rule here. The chief towns are Hissar,

Hansy, and Sursutty. HISSAR FEROZEH, the capital of the foregoing district, is in the midst of a once sandy desert, where water was sold at a high price to the travellers that passed this way from Persia to Delhi. Sultan Feroz, having caused the two before-mentioned canals to be dug, laid the foundations of a town and fortress, to which he gave the name of the Fort of Feroz. It was built of stone brought from the neighbouring hills of Nosa, and now belongs to an independent chief. Long. 75° 53' E., lat. 28° 41' N.

HISTER, in entomology, a genus of the coleoptera order of insects. The first articulation of the antennæ is compressed and curved; the last is considerably larger than the others, and ap-pears to be a solid knob; the head is drawn within the body; the mouth is forcipated; the elytra are shorter than the body; and the forelegs are dentated. The body is polished and very shining, and its form almost square; the thorax large and highly polished; anteriorly it is made with a slope, in the cavity of which is lodged the head, the position of which is often only discovered by the projection of the maxillæ; the head being, for the most part, so drawn under the thorax, that the insect looks as if it had none. The elytra are as it were cut off towards the extremity, and do not cover the whole of the abdomen. They are extremely smooth, and only have a few striæ, scarcely perceptible towards their outward side. Lastly, the hinder part of the abdomen, which projects beyond the elytra, is round and blunt. These insects are sometimes found in cow-dung, and often on sand. They vary prodigiously in size; but differ very little either in form or color, being all very dark. The larvæ, as well as the perfect insects, are frequently met with in the dung of horses, cows, &c.

wherein matters have been more truly *historified*, and therefore may be believed. *Browne's Vulgar Errours*. O, muse, *historify*

Her praise, whose praise to learn your skill hath framed me. Sidney.

In an historical relation we use terms that are most proper and best known. Burnet's Theory.

Our country which has produced writers of the first figure in every other kind of work, has been very barren in good historians. Addison.

What poor ideas must strangers conceive of persons famous among us, should they form their notions of them from the writings of those our *historiographers*.

With equal justice and historich care,

Their laws, their toils, their arms with his compare. Prior.

I put the journals into a strong box, after the manner of the historiographers of some eastern monarchs. A rbuthnot's History of John Bull.

After his life has been rather invented than written, I shall consider him *historically* as an author, with regard to those works he has left behind him.

Pope's Essay on Homer.

His works resemble a large history-piece, where even the less important figures have some convenient place. Pope.

Here rising bold the patriot's honest face ;	
There warriors frowning in historick brass.	Id.
Justly Casar scorns the poet's lays;	
It is to history he trusts for praise.	Id.
What histories of toil could I declare !	
But still long-wearied nature wants repair.	Id.
Material data and a second stark of the line	

Not added years on years my task could close, The long *historian* of my country's woes. Id.

History, so far as it relates to the affairs of the Bible, is necessary to divines. Watts.

HISTORY may, in general, be defined an account of the most remarkable events which have occured in the world, arranged in the order in which they happened, together with the causes from which they originated, and the different effects they produced. The word isopia literally denotes a search for curious things, a desire of knowing, or even a rehearsal of things we have seen; being formed from the verb isoperv, which properly signifies to know a thing by having seen it. But the ideas attached to it became gradually more extensive, and it is now applied to the knowledge of things taken from the report of others: from the verb $i\sigma\eta\mu\mu$, I know; and hence, among the ancients, several of their great men were called polyhistores, i. e. persons of various and general knowledge. The word history is, however, sometimes used

The word history is, however, sometimes used to signify a description of things, as well as an account of facts. Thus Theophrastus calls his work on the nature and properties of plants, a history of plants; we have a treatise of Aristotle, entitled a history of animals; and to this day the description of plants, animals, and minerals, are called by the general name of natural history.

But what chiefly merits the name of history, and what is here considered as such, is an account of the principal transactions of mankind from the beginning of the world; generally divided into two parts, viz. eivil and ecclesiastical. The first contains the history of mankind in their various relations to one another in common life; the second considers them as acting, or pretending to act, in obedience to what they believe to be the will of the Supreme Being. Civil history, therefore, includes an account of all the different states that have existed in the world, and likewise of those men who in different ages of the world have most eminently distinguished themselves, either for their good or evil actions. This last part of civil history, however, sometimes forms a distinct branch of study styled biography.

Few accomplishments are more valued than an accurate knowledge of the histories of different nations; and no literary production is more respectable than a well-written history of any nation: although the truth of Goldsmith's remark must be acknowledged, that history is generally little more than the register of human contention and calamity.

Geography and chronology have been called the eyes of history. The person who would

study history, therefore, ought first to make himself acquainted with the state of the world in general in different ages; the nations who inha-bited the different parts of it; what their extent of territory was; at what particular time they arose, and when they declined. He should next inform himself of the various events which have happened to each particular nation; and thus he will discover many of the causes of those revolutions, which before he only knew as facts. For, tory. a person may be familiar with the Roman history from the time of Romulus, without knowing why the city of Rome happened to be built at that time. This cannot be understood without a particular knowledge of the former state of Italy, and even of Greece and Asia; the origin of the Romans being commonly traced as high as Æneas, one of the heroes of Troy.

The outline of history may be easily obtained by the inspection of an historical chart, such as that subjoined to the present treatise. See plate HISTORY. The following short abridgment of general history may also serve to assist the student.

The plan extends back only to the Flood; the preceding period of 1656 years is therefore left blank in the chart. There being 2348 years from the Flood to the birth of Christ, the space between them is divided into twenty-three parts, each representing 100 years or a century, and a fraction representing the remaining forty-eight years. The space from the birth of Christ downwards is divided into eighteen parts or centuries : and all these parts, together with some centuries preceding the birth of Christ, are subdived into tens.

The vertical columns are geographical divisions; and events are marked in their proper centuries and proper columns. Thus the rise of any state, as that of Assyria, is marked in its proper geographical column, and in that place of the twenty-first century before Christ at which the beginning of its history is dated; thence we trace its continuance to the end of the seventh century before Christ, when it became extinct. The building of Rome is marked about the middle of the eighth century before Christ. Its territory extends by degrees to the conquest of all Italy; next to Spain, Macedonia, &c., until it comes to extend from Britain to Egypt. It continues of this magnitude until about the middle of the fifth century after Christ, when it begins to lose those provinces out of which the modern kingdoms of Europe have been formed in the order set down. As this appears on mere inspection, it will be more easily remembered than when it is conveyed in numbers only. The dates are taken chiefly from Blair's Chronological Tables. It would have been easy to have extended this chart by inserting remarkable events, the successions of kings and great men, &c., but clearness and simplicity appeared a preferable object. It was therefore thought proper to leave to every person the filling up of his own plan with such articles as are most in the line of his study. We have given a few specimens of the succession of the Roman emperors, and of the kings of England and France; and of the eras of one or two remarkable men, as those of Tacitus

cumstances neglected in charts of universal history. PART I.

placed together. We have seen both these cir-

OF CIVIL HISTORY.

INTRODUCTION.

Civil History, though it might seem incapable of any natural division, except that of arranging it according to the different states whose transactions it describes, may yet be very properly divided into the following periods, at each of which a great revolution took place, either with regard to the whole world, or a very considerable part of it: viz. 1. The creation of man; 2. The flood; 3.

The commencement of profane history, i. e. when leaving the fabulous relations of heroes, demigods, &c., to the poets, we arrive at some facts which demand our belief. 4. The conquest of Babylon by Cyrus, and the destruction of the Babylonian empire. 5. The reign of Alexander the Great, and the overthrow of the Persian empire. 6. The destruction of Carthage by the Romans, when the latter had no longer any rival capable of opposing their aim at universal empire. 7. The reign of Trajan, when the Roman empire was at its greatest extent. 8. The division of the empire under Constantine. 9. The destruction of the western empire by Odoacer, and the settlement of the different nations of Europe. 10. The rise of Mahomet and the conquests of the Saracens and Turks. 11. The Crusades, and the space intervening between that time and the American war. 12. The last but not the least important era, from the commencement of the American war to the period of the French revolution.

With regard to the number of years which have elapsed since the creation of the world, there have been many disputes. The compilers of the Universal History determine it to have taken place in the year 4305 B. C., so that, according to them, the world is now in the 6106th year of its age. Others think it was created only 4000 years B. C., so that it is not yet 5831 years old. But see our article CHRONOLOGY. Be this as it will, however, the whole account of the creation rests on the truth of the Mosaic history; which we must of necessity accept, because we can find no other, which does not either abound with the grossest absurdities, or lead us into absolute darkness. The Chinese and Egyptian pretensions to antiquity are so absurd and ridiculous, that the bare reading of them must be a sufficient confutation of those pretensions to every reasonable person.

SECT. I .-- FROM THE CREATION TO THE DE-LUGE.

The transactions during this period are little known, nothing indeed being recorded of them T 2 but what is to be found in the first six chapters of Genesis. In general, we know, that men were not at that time in a savage state, as poets and even historians have supposed; but that they had made some progress in the arts, had invented music, and found out the method of working metals. They seem also to have hived in one vast community, without any of those divisions into different nations which have since taken place, and which evidently proceeded from the confusion of languages.

The most material part of their history, however, is, that having once begun to trangress the divine commands, they proceeded to greater and greater lengths of wickedness, till at last the Deity thought proper to send a flood on the earth, which destroyed the whole human race, except eight persons, viz. Noah and his family.

This terrible catastrophe happened, according to the Hebrew copy of the Bible, 1656 years after the creation; according to the Samaritan copy, 1307. For the different conjectures concerning the natural causes of the flood, see the article DELUGE.

SECT. II.--FROM THE DELUGE TO THE COM-MENCEMENT OF PROFANE HISTORY.

For the history of this period we must again have recourse to the Scriptures, almost as much as for that of the first. We now find the human race reduced to eight persons, possessed of nothing but what they had saved in the ark, and the whole world to be stored with animals from those which had been preserved along with them. In what country their original settlement was made, is uncertain. The ark rested on Mount Ararat in Armenia, but it is impossible to know whether Noah and his sons made any stay in the neighbourhood of this mountain or not. Certain it is, that some time after the whole or the greatest part of the human race were assembled in Babylonia, where they engaged in building a tower, with the foolish and impious intention, as it would seem, of ascending to heaven. The Deity punished them by confounding their language; whence the division of mankind into different nations.

By the most probable accounts Gomer, the son of Japheth the son of Noah, was the father of the Gomerians or Celtes, i. e. of all the barbarous nations who inhabited the northern parts of Europe, under the names of Gauls, Cimbrians, Goths, &c., and who also migrated into Spain, where they were called Celtiberians. From Magog, Meshech, and Tubal, three of Gomer's brethren, proceeded the Scythians, Sarmatians, Tartars, and Moguls. The other three sons of Japheth, Madai, Javan, and Tiras, are said to have been the fathers of the Medes, the Ionians, Greeks, and Thracians.

The children of Shem were Elam, Asshur, Arphaxad, Lud, and Aram. The first settled in l'ersia, where he became the father of that mighty nation: the descendants of Asshur peopled Assyria: Arphaxad settled in Chaldea. Lud is supposed by Josephus to have taken up his residence in Lydia; though this is controverted. Aram, with more certainty, is believed to have settled in Mesopotamia and Syria.

The children of Ham were Cush, Mizraim Phut, and Canaan. Cush is thought to have remained in Babylonia, and to have been king of the south-east parts of it, afterwards called Khuzestan. His descendants are supposed to have removed into the eastern parts of Arabia; from whence they by degrees migrated into the corresponding part of Africa. Mizraim peopled Egypt, Ethiopia, Cyrenaica, Libya, and the rest of the northern parts of the same continent. The place where Phut settled is not known; but Canaan is universally allowed to have settled in Phœnicia; and to have founded those nations who inhabited Judea, and were afterwards mostly exterminated by the Jews.

Monarchical government began early, Nimrod the son of Cush having procured himself to be made king of Babylon. Asshur soon after emigrated from the new kingdom; built Nineveh, afterwards capital of the Assyrian empire; and two other cities, calied Resen and Rehoboth, of the situation of which we are now ignorant. Whether Asshur at this time set up as king for himself, or whether he held those cities as vassal to Nimrod, is uncertain. About the same time various other kingdoms sprang up in different parts of the world. Thus the Scripture mentions the kings of Egypt, Gerar, Sodom, Gomorah, &c., in the time of Abraham; and we may reasonably suppose, that these kings reigned over nations which had existed for some time.

The first considerable national revolution on record is the migration of the Israelites out of Egypt, and their establishment in the land of Canaan. For the history of these transactions we must refer to the Old Testament, where the reader will see that it was attended with a terrible catastrophe to the Egyptians, and with the utter extermination of some of the descendants of Ham, who inhabited Judea. The settlement of the Jews in the land of Canaan is supposed to have happened about 1491 B. C.

For nearly 200 years after this period we find no authentic account of any other nations than those mentioned in Scripture. About 1260 B.C. the Greeks began to make other communities feel the effects of that enterprising and martial spirit for which they were so remarkable, and which they had undoubtedly exercised upon one another long before. Their first enterprise was an invasion of Colchis, for the sake of the golden fleece. Whatever was the nature of this expedition, it is probable they succeeded in it; and that this specimen of the produce and riches of Asia inclined them to Asiatic expeditions afterwards. All this time we are totally in the dark about the state of Asia and Africa, except in so far as can be conjectured from Scripture. The ancient empires of Babylon, Assyria, and Persia, probably still continued in the former continent, and Egypt and Ethiopia seem to have been considerable kingdoms in the latter.

About 1184 years B. C. the Greeks again distinguished themselves by their expedition against Troy, a city of Phrygia Minor; which they plundered and burnt, massacreing the inhabitants with the most unrelenting cruelty. Æneas, a Trojan prince, escaped with some followers into Italy, where he became the remote founder of the Roman empire. At this time Greece was divided into a number of small principalities, several of which seem to have been in subjection to Agamemnon, king of Mycenæ. In the reign of Atreus, the father of Agamemnon, the Heraclidæ, who had been banished by Eurystheus, were again obliged to leave this country. Under their champion Hyllus they claimed the kingdom of Mycenæ as their right, pretending that it belonged to their ancestor Hercules, who was unjustly deprived of it by Eurystheus. See HEnACLIDÆ and HERCULES. The controversy was decided by single combat; but, Hyllus being killed, they departed, under a promise of not returning for fifty years.

About the time of the Trojan war, also, we find the Lydians, Mysians, and some other nations of Asia Minor, first mentioned in history. The names of the Greek states mentioned during this uncertain period are: 1. Sicyon. 2. The Leleges. 3. Messenia. 4. Attica. 5. Crete. 6. Argos. 7. Sparta. 8. Pelasgia. 9. Thessaly. 10. Attica. 11. Phocis. 12. Locris. 13. Ozolea. 14. Corinth. 15. Eleusis. 16. Elis. 17. Pilus. 18. Arcadia. 19. Ægina. 20. Ithaca. 21. Cephalenia, 22, Phthia. 23. Phocidia, 24. Ephyra. 25. Æolia. 26. Thebes. 27. Callista. 28. Ætolia. 29. The Dolopes. 30. Oechalia. 31. Mycenæ. 32. Eubœa. 33. The Minyæ. 34. Doris. 35. Pheræ. 36. Ionia. 37. Ťrachin. 38. Thesprotia. 39. Myrmidonia. 40. Sałamis. 41. Seyros. 42. Hyperia or Melite. 43. The Vulcanian Isles. 44. Megara. 45. Epirus. 46. Achaia. 47. The isles of the Ægean Sea. Concerning many of these we know little or nothing; the most remarkable particulars respecting the rest may be found under their names.

About 1048 B.C. the kingdom of Judea under king David approached its utmost extent of power. Leaving the reader to acquaint himself, from Scripture, with the details of its condition under Solomon, we may observe that the first shock given to the Jewish grandeur in the division of the kingdom into two, through the imprudence of Rehoboam, rendered it the more easily a prey to Shishak king of Egypt; who five years after came and pillaged Jerusalem, and all the fortified cities of Judah. The commerce to the East Indies, begun by Solomon, seems now to have been discontinued. Whether this Shishak was the Sesostris of profane writers or not, seems questionable; his expedition against Jerusalem, as recorded in Scripture, was very similar to the desultory conquests ascribed to Sesostris, and it seems impossible to fix on any other king of Egypt who can be supposed to have undertaken this expedition in the days of Rehoboam.

In 941 B. C. Zera, an Ethiopian, invaded Judea with an army of 1,000,000 infantry and 300 chariots; but was defeated with great shaughter by Asa, who engaged him with an army of 580,000 men. About this time also the Syrians had become a considerable people, and bitter enemies both to the kings of Israel and Judah; aiming in fact at the conquest of both nations, by pretending to assist the one against the other. In 740 B. C., however, the Syrian empire was totally destroyed by Tiglath-Pileser, king of Assyria; as was also the kingdom of Samaria by

Shalmaneser his successor in 721. The people were either massacred, or carried captives into Media, Persia, and the countries about the Caspian Sea.

While the eastern nations were thus destroying each other, the foundations of very formidable empires were laid in the west, which, in process of time, were to swallow up almost all the eastern ones. In Africa, Carthage was founded by a Tyrian colony, about 869 B. C., according to those who ascribe the highest antiquity to that city; but, according to others, it was founded only in 769, or 770 B.C. In Europe a very considerable revolution took place about 900 B.C. The Heraclidæ, after several unsuccessful attempts, at last conquered the whole Peloponnesus. From this time the Grecian states became more civilised, and their history less obscure. The institution, or rather the revival and continuance, of the Olympic games, in 776 B. C., also greatly facilitated not only the writing of their history, but that of other nations ; for, as each Olympiad consisted of four years, the chronology of every important event became indubitably fixed by referring it to such and such an Olympiad. In 748 B.C., or the last year of the seventh Olympiad, the foundation of Rome was laid by Romulus; and, forty-three years after, the Spartan state was new modelled, and received from Lycurgus those laws, by observing of which it afterwards arrived at such a pitch of prosperity.

Sect. III.—From the Commencement of Profane History to the Erection of the Babylonian Empire by Nebuchadnezzar.

With the beginning of the twenty-eighth Olympiad, or 568 B. C., commences the third general period above mentioned, when profane history becomes somewhat clear, and the relations concerning the different nations may be depended upon with some degree of certainty. The general state of the world at this period was as follows:—

The northern parts of Europe were thinly inhabited, or filled with unknown and barbarous nations. France and Spain were inhabited by the Gomerians or Celtes. Italy was divided into a number of petty states, arising partly from Gaulish, and partly from Grecian colonies, among which the Romans had already become formidable. They were governed by their sixth king, Servius Tullius; had increased their city by the demolition of Alba Longa, and the removal of its inhabitants to Rome; and had enlarged their dominions by several cities taken from their neighbours.

Greece was divided into a number of small states, among which the Athenians and Spartans, being the most remarkable, were rivals to each other. The former had, about 599 B. C., received the excellent laws of Solon, and were enriching themselves by navigation and commerce; the latter were become formidable by the martial institutions of Lycurgus. The other states of most consideration were Corinth, Thebes, Argos, and Arcadia.

In Asia Nebuchadnezzar now sat on the throng of Babylon. By him the kingdom of Judea was totally overthrown in 587 B. C. Three years before this he had taken and razed the city of Tyre, and over-run all Egypt. He is even said by Josephus to have conquered Spain, and reigned there nine years; but this seems improbable. His empire comprehended Phœnicia, Palestine, Syria, Babylonia, Media and Persia, and part of India. When we consider that the whole strength of this mighty empire was employed in beautifying the metropolis, we cannot regard the wonders of that city, as related by Herodotus, as at all incredible.

Sect. IV.—From the Erection of the Babylonian Empire to its Overthrow by Cyrus.

This fourth general period is very short, embracing only the revolution occasioned by the misconduct of Evil-merodach, Nebuchadnezzar's son, in his father's life time. Having, in a hunting match, entered the country of the Medes, and some of his troops coming up to relieve the garrisons in those places, he joined them to those already with him, and without the least provocation began to plunder and lay waste the country. This produced an immediate revolt, which quickly extended over all Media and Persia. The Medes, headed by Astyages, and his son Cy-axares, drove back Evil-merodach and his party with great slaughter; nor does it appear that they were afterwards reduced by Nebuchadnezzar. The new empire continued daily to gather strength; and at last Cyrus, Astyages's grandson, a prince of great prudence and valor, being made generalissimo of the Median and Persian forces, took Babylon itself, in the year 538, B.C. See BABYLONIA.

The Romans, during this period, increased in power under the wise government of Servius Tullius, a pacific prince, who rendered this people more formidable by a peace of twenty years, than his predecessors had done by all their victories. The Greeks now began to interfere with the Persians, on account of the Ionians, or Grecian colonies in Asia Minor. Whe-ther the Lydians had been subdued by the Babylonish monarch or not, is not ascertained; though it is probable that they were either in subjection to him, or greatly awed by his power, as before his death nothing considerable was undertaken by them. It is also very probable that during the insanity of Nebuchadnezzar, spoken of by Daniel, the affairs of his kingdom would fall into confusion. Certain it is, that, if the Babylonians did not regard Crœsus as their subject, they considered him as a very faithful ally

When Cyrus, therefore, was proceeding in his conquest of the Babylonish empire, before he proceeded to attack the capital, he offered advantageous terms to the Ionians, but they refused to submit to him. Soon after, however, Crœsus himself being defeated and taken prisoner, the Ionians sent ambassadors to Cyrus, offering to embrace his terms. These were now refused; and the Ionians applied to the Spartans for aid. Thus commenced the hatred between the Greeks and Persians. The transactions of Africa during this period are almost entirely unknown; though the Carthaginians were doubtless enriching themselves by means of their commerce.

SECT. V.—FROM THE ERECTION OF THE PER-SIAN EMPIRE TO ITS OVERTHROW BY ALEX-ANDER: AND TO THE DIVISION OF THE GRE-CIAN EMPIRE, UPON HIS DEATH.

Cyrus having now become master of all the east, the Asiatic affairs continued for some time in a state of tranquillity. The Jews obtained leave to return to their own country, and rebuild their temple. The successor of Cyrus, Cambyses, added Egypt to his empire. He intended also to have subdued the Carthaginians; but the Phœnicians refused to supply him with ships.

In 517, B. C., the Babylonians, finding themselves grievously oppressed by their Persian masters, resolved to shake off the yoke, and for this purpose stored their city with provisions. When Darius Hystaspis advanced against them, they collected all the women, old men, and children, into one place, and strangled them without distinction, whether wives, fathers, mothers, brothers, or sisters; every one being allowed to select only one wife and a maid-servant. This cruel policy did not avail them: their city was taken, and the king caused the walls to be beat down from 200 to fifty cubits height.

Darius then turned his arms against the Scythians; after which he directed his course eastward, and reduced the country as far as the Indus. In the mean time, the Ionians revolted; and the conquest of Greece was projected: but the expeditions for that purpose ended most unfortunately for the Persians. See ATTICA, PERSIA, and SPARTA.

In 459, B. C., the Egyptians attempted to recover their liberty, but were reduced after a war of six years. In 413, B. C., they revolted a second time; and, being assisted by the Sidonians, drew upon the latter that terrible destruction foretold by the prophets; while they themselves were so thoroughly humbled, that they never after made any attempt to recover their liberty.

The revolt of Cyrus the younger against his brother Artaxerxes Mnemon, in which, through his own rashness, he miscarried, and lost his life at the battle of Cunaxa, in the province of Babylon, happened in the year B.C. 401 or 403. 10,000 Greek mercenaries, who served in his army, made their way back into their country, though surrounded on all sides by the enemy. In this retreat they were commanded by Nenophon, who has received the highest praise on account of his conduct and military skill. Two years after, the invasion of Agesilaus, king of Sparta, threatened the Persian empire with total destruction.

The various transactions between the Grectan states, though they make a considerable figure in their respective histories, make but a small one in a general sketch. We shall, therefore, only observe, that in 404, B.C., the Athenian power was totally broken by the taking of their city by the Spartans. See ATTICA. In 370 that of the Spartans received a severe check from the Thebans at the battle of Leuctra; and eight years after was still further reduced by the battle of Mantinea. The Macedonians, a barbarous nation lying to the north of the states of Greece, now rose into power under Philip, who being no stranger to the weakened situation of Greece, began to meditate the conquest of it.

The particulars of this enterprise will be found under the article MACLDON. Here it is sufficient \Rightarrow mention, that by first attacking those he was sure he could overcome, and corrupting those whom he thought it dangerous to attack; by sometimes pretending to assist one state and sometimes another, and by imposing upon all as best suited his affairs, he finally gained his end. In 338 B.C. he procured himself to be elected general of the Amphictyons, and, having once obtained liberty to enter that country with am army, he quickly convinced the states that they must all submit to him.

Philip when master of all Greece, projected the conquest of Asia, when he was suddenly assassinated.

Alexander his son was possessed of every quality necessary for the execution of so great a plan; and his impetuosity of temper made him execute it with an unheard of rapidity. He met with only two checks in his Persian expedition. The one was from the city of Tyre, which for seven months resisted his utmost efforts; the other was from Memnon the Rhodian, who had undertaken to invade Macedonia. The first of these obstacles Alexander at last overcame, and treated the governor and inhabitants with the utmost cruelty. The other was scarcely felt; for Memnon died after reducing some of the Grecian islands, and Darius had no other general capable of conducting the undertaking. The power of the Per-sian empire was totally broken by the victory gained over Darius at Arbela, in the year 331 B. C., and next year a total end was put to it by the murder of the king by Bessus.

Alexander now invaded and reduced Hyrcania, Bactria, Sogdiana, and all the vast tract of country now called Bukharia. Having entered India, he reduced all the nations to the river Hyphasis, one of the branches of the Indus. But when he would have proceeded farther, and extended his conquests quite to the eastern extremities of Asia, his troops positively refused to follow him.

Rome and Carthage were now making considerable advances in the west. During the time of their kings, the Romans had made a very considerable figure among the Italian nations; but after their expulsion, and the commencement of the republic, their conquests became much more rapid and extensive. In 501 B.C. they subdued the Sabines ; eight years after, the Latins; and in 399 the city of Veii, the strongest in Italy, excepting Rome itself, was taken after a siege of ten years. But in the midst of their successes a sudden irruption of the Gauls had almost put an end to their power. The city was burnt to the ground in 383 B. C., and the capitol ou the point of being surprised, when the Gauls, who were climbing up the walls in the night, were accidently discovered and repulsed. Rome was soon rebuilt; but at the celebrated Camillus's death, which happened about 352 B. C., its

territory scarcely extended six or seven leagues from the capital. The people had been divided by Romulus into two classes, namely patricians and plebeians, answering to our nobility and commonalty. Between these two bodies were perpetual jealousies and contentions; which retarded the progress of the Roman conquests, and revived the hopes of the nations they conquered. The tribunes of the people were perpetually opposing the consuls and military tribunes, and the senate had often recourse to a dictator endowed with absolute power. Thus had the Romans continued for nearly 400 years, running the same round of wars with the same enemies, and reaping little advantage from their conquests, till at last matters were compounded, by choosing one of the consuls from among the plebeians; and from this time chiefly we may date the prosperity of Rome.

The Carthaginians in the mean time continued to enrich themselves by commerce; but were by no means equal to the Romans in power. A new state, however, made its appearance during this period, which may be said to have taught the Carthaginians the art of war. This was Sicily. At what time it was first peopled cannot be ascertained. In the second year of the seventeenth Olympiad, or 710 B. C., some Greek colonies are said to have arrived on the island, and in a short time founded several cities, of which Syracuse was the chief.

The first considerable monarch of Syracuse was Gelon, who obtained the sovereignty about the year 483 B. C. The Carthaginians possessed some part of the island as early as 505 B. C.; but, in twenty-eight years after, they had been totally driven out by Gelon.

The island also proved the scene of much slaughter and bloodshed in the wars of the Grecian states. Before the year 323 B.C., however, the Carthaginians had made themselves masters of a very considerable part of Sicily; whence all the power of the Greeks could not dislodge After the destruction of Tyre almost all them. the commerce in the western part of the world fell to the share of the Carthaginians; but whether they had at this time made many settlements in Spain, is not known. It is certain, that they traded to that country for the sake of the silver, as they probably also did to Britain for tin. In the year 323 B. C. Alexander the Great died at Babylon, without settling the affairs of his vast empire, or even naming a successor; and four new empires immediately rose out of it.

Sect. VI.—From the Division of the Grecian Empire, to the Destruction of the Carthaginian Republic by the Romans.

Alexander had left behind him a victorious, and, we may say, invincible army, commanded by most expert officers, all equally ambitious of authority. Cassander, the son of Antipater, had seized Macedonia and Greece; Antigonus, Asia Minor; Seleucus had Babylori and the eastern provinces; and Ptolemy, Egypt and the western ones. One of these empires, however, soon fell; Antigonus being defeated and killed by Seleucus and Lysimachus at the Battle of Ipsus, in 301 B. C. The greatest part of his dominions then fell to Seleucus: but several provinces took the opportunity of these confusions to shake off the Macedonian yoke altogether; and thus were formed the kingdoms of Pontus, Bithynia, Pergamus, Armenia, and Cappadocia.

The two most powerful and permanent empires, however, were those of Syria, founded by Seleucus, and Egypt by Ptolemy Soter. The kings of Macedon, though they did not preserve the same authority over the Grecian states that Alexander, Antipater, and Cassauder had done, yet effectually prevented them from those outrages upon one another for which they had formerly been so remarkable.

While the eastern parts of the world were thus deluged with blood, the Romans and Carthaginians also proceeded in their attempts to enslave the western nations. About the year 253 B. C. the former had made themselves masters of almost the whole of Italy; but Pyrrhus king of Epirus, in 271 B. C., entered that country, and maintained a war with them for six years. He was finally defeated, however, and the Romans being invited into Sicily, to assist the Marmertines against Hiero II. king of Syracuse and the Carthaginians, they immediately commenced a war with the latter, which continued for twentythree years; and the consequence was the entire loss of Sicily to the Carthaginians; soon after the Romans seized on Sardinia.

Hamilcar now set about the subjugation of Spain; and his son Asdrubal continued the war with success; till at last the Romans engaged him to make the river Iberus the boundary of his conquests.

The transactions of the second Punic war are perhaps the most remarkable recorded in history. We now see the Romans, who for more than 500 years had been constantly victorious, unable to resist the efforts of a single man, until at last, Hannibal, the conqueror of Italy, was obliged to abandon his final designs for want of 20,000 or 30,000 men. Hannibal had concluded an alliance with Philip VI. of Macedonia. Had that prince sent an army to the assistance of the Carthaginians in Italy, immediately after the battle of Cannæ, there can be no doubt but the Romans would have been forced to accept of peace. Philip, however, could not be roused. The issue was that the Carthaginian armies, unsupported in Italy, were recalled into Africa, which the Romans had invaded. Here Hannibal was defeated at the battle of Zama, which finished the

second Punic war, in the year 188 B. C. All this time Egypt, Syria, and Greece, had been promoting their own ruin by mutual wars. The Syrian empire was now governed by Antiochus the Great, and to him Hannibal applied, when he was obliged to leave his country, and the Romans declared war against him. The event was, that Antiochus was every where defeated, and forced to conclude a peace upon very disadvantageous terms.

The states of Greece, weary of the tyranny of the Macedonians, now entered into the resolution of recovering their liberties. For this purpose was framed the Achæan League; but they at last came to the imprudent determination of

calling in the Romans to defend them. This produced a war in which the latter were victorious; but Perseus, the successor of Philip, renewed the war, until Macedon submitted to the Romans, 167 B. C.

After this, war was declared a third time against the unfortunate Carthaginian state; there was now no Hannibal to command their armies, and Carthage was utterly destroyed in the year 146 B. C. The same year the Romans put an end to the liberties they had pretended to grant the cities of Greece, by the entire destruction of Corinth.

The only transaction of any considerable consequence in the Syrian empire, at this period, is the oppression of the Jews by Antiochus Epiphanes. After their return from the Babylonish captivity, they continued in subjection to the Persians, till the time of Alexander. From that time they were subject to the kings of Egypt or Syria, as the fortune of either happened to pre-vail. Egypt being reduced by Antiochus Epi-phanes, the Jews fell under bis dominion ; and, being severely treated by him, imprudently showed some signs of joy on a report of his death. This brought him against them with a powerful army; and in 170 B.C. he took Jerusalem by storm, committing the most horrid cruelties on the inhabitants. Their religion was for a while totally abolished, their temple profaned, an image of Jupiter Olympius set up, and a sow sacrificed on the altar of burnt offerings. In 167 B.C., however, Mattathias restored the true worship in most of the cities of Judea; and in 165 the temple was purified by Judas Maccabæus. This was followed by a long series of wars between the Syrians and Jews, in which the latter were almost always victorious.

Sect. VII.—From the Destruction of Carthage to the Death of Trajan, when the Roman Empire had attained to its utmost Extent.

The empire of Syria at first comprehended all Asia to the river Indus, and beyond it; but in 312 B. C. most of the Indian provinces had been by Seleucus ceded to Sandrocottus, or Androcottus, a native, who in return gave him 500 elephants. Of the empire of Sandrocottus we know nothing farther than that he subdued all the countries between the Indus and the Ganges; so that from this time the greatest part of India became independent of the Syro-Macedonian princes. In 250 B. C., however, the empire sustained a much greater loss by the revolt of the Parthians and Bactrians from Antiochus Theos. The former could not be subdued; and, as they held in subjection to them the extensive country now called Persia, their defection was an irreparable loss. Whether any part of their country was afterwards recovered, by the kings of Egypt or Syria, is not certain. The general state of the world B. C. 146 was as follows :-

In Asia were the empires of India, Parthia, and Syria, with the smaller states of Armenia, Pontus, &cc., to which we must add that of Arabia, which during the sixth period had become of some consequence, and had maintained its independence from the days of Ishmael. In Africa were the kingdoms of Egypt and Ethiopia; the Carthaginian territories, now subject to the Romans; and the kingdoms of Numidia, Mauritania, and Getulia, ready to be swallowed up by the same ambitious and insatiable power, now that Carthage was destroyed, which had served as a barrier against it. To the south lay unknown and barbarous nations, secure by their situation and insignificance, rather than their strength, or distance from Rome. In Europe we find none to oppose the progress of the Roman arms, except the Gauls, and some nations of Spain.

The Spaniards had indeed been subdued by Scipio Africanus during the second Punic war; but in 155 B. C. they revolted; and under the conduct of one Viriathus, formerly a robber, held out for a long time against all the armies the Romans could send into Spain. Him the consul Cæpio caused to be murdered about 138 B. C., because he found it impossible to reduce him by force. Numantia defied the whole Roman power for six years longer.

[^] About this time Attalus king of Pergamus left by will the Roman people heirs to all his goods; upon which they immediately seized on his kingdom and reduced it to a Roman province, under the name of Asia Proper. In 122 B.C. the Balearic Islands, now called Majorca, Minorca, and Ivica, were subdued. The event of it was the total reduction of Numidia, which took place about the year 105 B.C.; but Mauritania and Getulia preserved their liberty for some time longer.

In the east the empire of Syria continued to decline; by which means the Jews not only had an opportunity of recovering their liberty, but even of becoming almost as powerful, or at least of extending their dominions as far, as in the days of David and Solomon. The Syrian empire was farther reduced by the civil dissensions between the two brothers, Antiochus Gryphus and Antiochus Cyzicenus ; during which the cities of Tyre, Sidon, Ptolemais, and Gaza, declared themselves independent. This happened about 100 B.C.; and, seventeen years after, the whole was reduced by Tigranes king of Armenia. On his defeat, by the Romans, the latter reduced Syria to a province of their empire. Pontus was subdued about 64 B.C. The kingdom of Judea also was reduced under the same power about this time. It owed the loss of its liberty to the same cause that had ruined various other states, namely, calling in the Romans to be arbitrators between contending parties. Hyrcanus and Aristobulus had contended for the kingdom, when the latter applied to the Romans, and Pempey the Great decided against him; but at the same time deprived Hyrcanus of all regal power, and did not allow him to extend his territory beyond the ancient borders of Judea.

In the west, however, the Gauls were still free, and the Spanish nations bore the Roman yoke with great impatience; while the kingdom of Egypt remained independent. The battle of Actium, however, determined the fate of Antony, Cleopatra, and Egypt itself; which was reduced to a Roman province, about the year 29 B.C.

This same event was the destruction of the

Roman republic; and it proved advantageous to the few nations of the world who still retained their liberty. That outrageous desire of conquest, which had so long marked the Roman character, now in a measure ceased; and after the final reduction of Spain, and the conquest of Mæsia and Pannonia, the empire enjoyed for some time a profound peace.

The only remarkable transactions which took place during the remainder of this period, were the conquest of Britain by Claudius and Agricola, and the destruction of Jerusalem by Vespasian and Titus. The war with the Jews began A.D. 67; and was occasioned by their obstinately claiming the city of Cæsarea, which the Romans had added to Syria. It ended in 73, with the most terrible destruction of their city and nation; since which time they have never been able to exercise sovereign authority. The southern parts of Britain were totally subdued by Agricola about ten years after.

In the year 98, of the Christian æra, Trajan was emperor of Rome; and the empire reached its utmost extent. Having conquered the Dacians, a German nation beyond the Danube, he turned his arms eastward; reduced all Mesopotamia, Chaldæa, and Assyria; and having taken Ctesiphon, the capital of the Parthian empire, appointed them a king. After this he proposed to return to Italy, but died by the way.

SECT. VIII.—FROM THE COMMENCEMENT OF THE DECLINE OF THE ROMAN EMPIRE, TO ITS DIVISION UNDER CONSTANTINE.

No sooner, however, had the vast empire of the Romans attained its utmost degree of power, than, like its predecessors, it began to decline. The provinces of Babylonia, Mesopotamia, and Africa, almost instantly revolted, and were abandoned by Adrian, the successor of Trajan. The Parthians, having recovered their liberty, were very formidable enemies, and the barbarians of the northern parts of Europe continued to increase in strength. At different times, however, some warlike emperors arose, who put a stop to the incursions of these barbarians; and, about the year 225, the Parthian empire was totally overthrown by the Persians. But the latter became still more troublesome enemies to the empire than the Parthians; and, though often defeated, they long continued to infest it on the east. In 260 the defeat and captivity of Valerian, by the Persians, threatened the empire with utter destruction. Thirty tyrants now seized the government at once; and the barbarians, pouring in on all sides, ravaged almost all the provinces. By the vigorous conduct of Claudius II., Aurelian, Tacitus, Probus, and Carus, the empire was in part, indeed, restored to its former lustre; but the barbarians were never thoroughly subdued.

An end was put to these evils when the empire was united under Constantine the Great; but in 330 a mortal blow was given to it, by his removing the imperial seat to Constantinople. The establishment of Christianity, now corrupted with the grossest superstitions, proved also no small detriment to the empire. SECT. IX.—FROM THE DIVISION OF THE ROMAN EMPIRE TO THE DESTRUCTION OF THE WEST-ERN PART OF IT, AND THE RISE OF MAHOMET AND OF THE EUROPEAN STATES.

We now see that mighty empire, which formerly occupied almost the whole world, weakened by division, and surrounded by enemies. On the east, the Persians; on the north, the Scythians, Sarmatians, Goths, and a multitude of other barbarous nations, watched all occasions to break into it; and miscarried in their attempts rather through their own barbarity than the strength of their enemies.

Some of the Roman emperors indeed withstood this inundation of savages; but as the latter grew daily more numerous, and the Romans continued their intestine wars, they were at last obliged to take large bodies of barbarians into their pay, and teach them their military discipline. This at last proved their total destruction; for, in 476, the barbarians who served in the Roman armies, and were dignified with the title of allies, demanded the third part of the lands of Italy as a reward for their services; and, meeting with a refusal, revolted, and made themselves masters of Rome itself.

Spain was at this time held by the Goths and Suevians; Africa (that is, Barbary and Biledulgerid), by the Vandals; the Burgundians, Goths, Franks, and Alans, had erected several small states in Gaul; Italy was subjected to the Heruli under Odoacer, who had assumed the title of King of Italy; and Britain was abandoned.

The empire, indeed, continued to maintain its sway at Constantinople, and comprehended all Asia Minor and Syria, as far as Persia; in Africa, the kingdom of Egypt; and Greece in Europe. It was engaged, however, in continual wars with the Persians, Bulgarians, and other barbarous nations; and superstition and a general relaxation of military discipline hastened its downfal.

Among the western nations, revolutions succeeded one another with rapidity. The Heruli under Odoacer were driven out by the Goths under Theodoric. The Goths were expelled by the Romans; and, while the two parties were contending, both were attacked by the Franks. The Romans were in their turn expelled by the Goths: the Franks again invaded Italy, and made themselves masters of the province of Venetia; but at last the superior fortune of the emperor of Constantinople prevailed, and in 553 the Goths were finally subdued.

Narses, their conqueror, governed Italy as a province of the eastern empire till the year 568, when Longinus his successor made considerable alterations. Being invested with absolute power, by Justinian, he suppressed the consulares, correctores, and præsides; and placed in each city of note a governor, whom he distinguished with the title of duke. The city of Rome was not more honored than any other; for Longinus, having abolished the name of senate and consuls, appointed a duke of Rome as well as of other cities. To himself he assumed the title of exarch; and, residing at Ravenna. Is government was styled the exarchate of Ravenna. While he was establishing this new empire, the greatest part of Italy was conquered by the Lombards. In 487 Clovis, the founder of the French monarchy, possessed himself of all the countries lying between the Rhine and the Loire. See FRANCE.

In Spain the Visigoths erected a kingdom ten years before the conquest of Rome by the Heruli. This they extended eastward, about the same time that Clovis was extending his conquests to the west; so that the two kingdoms united at the river Loire. The consequence of this was an immediate war, and Clovis proved victorious.

Another kingdom had in the mean time been founded in the western parts of Spain by the Suevi. In 409 this kingdom was entirely subverted by Theodoric king of the Goths, who in 584 became masters of almost all Spain.

Africa, properly so called, had changed its masters three times during this period. The Vandals had expelled the Romans, and erected an independent kingdom, which was at last overturned by the emperors of Constantinople; and from them the greatest part of it was taken by the Goths in 620.

Sect. X.—From the Rise of the Mahommedan Superstition to the Commencement of the Crusades.

The tenth general period of history commences with the flight of Mahomet in the year 622 (whence his followers date their era called the Hegira). The Roman empire in the west was now annihilated; the Persian empire, and that of Constantinople, weakened by their mutual wars and intestine divisions; the Indians and other eastern nations unaccustomed to war, and ready to fall a prey to the first invader; the southern parts of Europe were also in a distracted and barbarous state; while the inhabitants of Arabia, from their earliest origin accustomed to war and plunder, were like a flood pent up, and ready to overwhelm the rest of the world.

With amazing celerity, therefore, they overran all Syria, Palestine, Persia, Bukharia, and India, extending their conquests farther to the eastward than ever Alexander had done. On the west their empire soon extended over Egypt, Barbary, Spain, Sicily, Sardinia, Majorca, Minorca, &c., and many of the isles in the Archipelago: nor were the coasts of Italy itself free from their incursions; they are even said to have reached the distant and barren country of Iceland. But at last this great empire began to decline, and its ruin was very sudden. Mahomet had not taken care to establish the apostleship in his family, or to give any particular directions about a successor. The consequence was, that the caliphat, or succession to the apostleship, was seized by many usurpers; and those who resided at Bagdad were regarded only as a kind of high priests. Of these divisions the Turks took advantage, to establish their authority in many provinces.

While the barbarians of the cast were thus conquering, for the glory of God and his apostle Mahomet, the western nations professed an equal regard for the divine glory, and exemplified it in the respect they paid to the pope and the clergy

Ever since the establishment of Christianity, by Constantine, the bishops of Rome had been gradually extending their power; and when in-726 Luitprand, king of the Lombards, had taken Ravenna, and expelled the exarch, the pope undertook to restore him. He applied, for this purpose, to the Venetians, who are now first mentioned in history, and by their means the exarch was restored. Some time before a quarrel had happened between pope Gregory II., and Leo III., emperor of the east, about the worship of images. Leo, who, in the midst of so much barbarism, had still preserved some share of common sense, reprobated this in the strongest terms, and commanded the objects of it to be destroyed throughout his dominions. At the instigation of the pope a revolt ensued; the exarch, who attempted to fulfil the emperor's commands, was excommunicated ; and then torn in pieces by the multitude : the duke of Naples shared the same fate: and a vast number of the iconoclasts, or image-breakers, as they were called, were slaughtered without mercy.

Charles Martel, who then governed France as mayor of the palace, was in the end applied to; but, before a treaty could be concluded, all the parties concerned were cut off. Constantine Copronymus, who succeeded Leo at Constantinnople, not only persisted in the opposition to image worship, begun by his predecessor, but prohibited also the invocation of saints.

Zachary, who succeeded Gregory III. in the pontificate, proved as zealous an adversary as his predecessor; and Pepin, who succeeded Charles Martel in the sovereignty of France, proved as powerful a friend to the pope as his father had been. The people of Rome had nothing to fear from Constantinople; and therefore drove out all the emperor's officers. Awed by the power of France, the Lombards for some time allowed the pope to govern the dominions of the exarchate in peace; but in 752 Astolphus, king of Lomoardy, again threatened Rome itself. Upon this an application was made to Pepin, who obliged Astolphus to restore the places he had taken, and gave them to the pope, or, as he said, to St. Peter. The Greek emperor, to whom they of right belonged, remonstrated to no purpose. The pope from that time became possessed of considerable territories in Italy. It was not, however, before the year 774 that he was fully settled in this new dominion.

The world was now once more shared among three great powers. The empire of the Arabs or Saracens extended from the Ganges to Spain; comprehending almost all of Asia and Africa which has ever been known to Europeans, China and Japan excepted. The eastern Roman empire was reduced to Greece, Asia Minor, and the provinces adjoining to Italy. The empire of the west, under Charlemagne, comprehended France, Germany, and the greatest part of Italy.

Of all nations on the earth, the Scots and Picts, and the remote ones of China and Japan, seem to have enjoyed, from their situation, the greatest share of liberty; unless perhaps we except the Scandinavians, who, under the names of Danes and Normans, were soon to infest their southern neighbours.

The Saxon heptarchy was dissolved in 827, and the whole kingdom of England reduced under one head. The Danes and Normans began to make depredations, and infest the neighbouring states. The former conquered the Anglo-Saxons, and seized the government, but were in their turn expelled by the Normans in 1066. In Germany and Italy the greatest dis-turbances arose from the contests between the popes and emperors. To all this, if we add the internal contests which happened through the ambition of the powerful barons of every kingdom, we can scarcely form an idea of times more calamitous than those at which we now arrive. All Europe, nay, all the world, was one great field of battle, for the empire of the Turks was not in a more settled state than that of the Europeans. Caliphs, sultans, emirs, &c., waged continual war with each other in every quarter; new sovereignties every day sprung up, and were as quickly destroyed. At last the crusades, by directing the attention of Europeans to one particular object, made them in some measure suspend the slaughter of one another.

Sect. X1.—From the Commencement of the Crusades to that of the American Revolution.

The erusades originated in the superstition of the two grand religious parties into which the world was at that time divided, namely, the Christians and Mahommedans. See CRUSADES. Both looked upon the small territory of Palestine, which they called the Holy Land, to be an invaluable acquisition. The first crusades accordingly poured forth in multitudes, like those with which the kings of Persia formerly invaded Greece; and their fate was nearly similar. They at first, indeed, carried every thing hefore them; but their want of conduct soon lost what their valor had ob-tained, and very few of that vast multitude which had left Europe ever returned. A second, a third, and several other crusades, were preached. and were attended with like success and like reverses. Vast numbers took the cross, and repaired to the Holy Land; which they polluted by the most abominable massacres and treacheries, and from which very few of them returned.

Jenghiz Khan, the greatest as well as the most bloody conqueror that ever existed, now made his appearance in the east. The rapidity of his conquests seemed to emulate those of Alexander; but the cruelties he committed were altogether unparalleled.

The Moguls, over whom he assumed the sovereignty, were a people of Tartary, divided into a number of petty governments, who owned subjection to one sovereign, whom they called Vang-Khan, or the great khan. Temujin, afterwards Jenghiz Khan, was one of these petty princes, unjustly deprived of the greatest part of his inheritance at the age of thirteen. Twentyseven years after, which corresponds with the year 1201, he totally reduced the rebels; and, as a specimen of his lenity, caused seventy of their chiefs to be thrown into as many caldrons of boiling water. In 1202 he defeated and killed Vang-khan himself, known to Europeaus by the name of Prester John of Asia; and, possessing himself of his vast dominions, became In 1206 he was thenceforward irresistible. declared khan of the Moguls and Tartars ; and took upon him the title of Jenghiz Khan, or the great khan of khans. This was followed by the reduction of the kingdoms of Hya in China, Tangut, Kitay, Turkestan, Karazim, or the kingdom of Gazna, Great Bukharia, Persia, and part of India; all which vast regions were reduced in twenty-six years, no fewer than 14,470,000 persons being computed to have been massacred by him. He died in the beginning of 1227. His successors completed the conquest of China and Korea; but were foiled in their attempts on Cochin China, Tong-King, and Japan.

His empire, however, was soon divided and weakened until we arrive at the times of Timur Bek, or Tamerlane. The Turks at this time, urged forward by the inundation of Tartars who poured in from the east, were forced upon the remains of the Greek empire; and at the time of Tamerlane they had almost confined this once mighty empire within the walls of Constantinople. In 1335 the family of Jenghz Khan became extinct in Persia.

In 1362 Tamerlane invaded Bukharia, which he reduced in five years. He proceeded in his conquests, though not with the same celerity as Jenghiz Khan, till 1387, when he had subdued all Persia, Armenia, Georgia, Karazim, and great part of Tartary. After this he proceeded westward, subduing all the countries to the Euphrates, made himself master of Bagdad, and even pillaged Moscow. Thence he turned his arms to the east, and totally subdued India. In 1393 he invaded and reduced Syria; and, having turned his arms against the Turks, forced their sultan, Bajazet I., to raise the siege of Constantinople. At last this great conqueror died in 1405, while on his way to conquer China, and most of the nations he had conquered recovered their liberty. In 1453 the conquest of Constantinople by the Turks fixed that wandering people to one place; and though they now possess very large regions in Europe, Asia, and Africa, an effectual stop has long been put to their further progress.

About this time learning began to revive in Europe, where it had long been lost; and the invention of printing rendered it impossible for the ancient barbarism ever to return. This soon produced improvements in navigation; and the discovery of many unknown regions.

In the end of the fifteenth century the vast continent of America became known to Europe; and, about the same time, the passage to the East Indies by the Cape of Good Hope was accomplished. The Portuguese had the advantage of being the first modern discoverers of the eastern, and the Spaniards of the western world. Neither neglected so favorable an opportunity of enriching themselves by commerce; but their avarice, and perfidious behaviour towards the natives, proved at last its own punishment, and, in many cases, soon ended in their expulsion. See MLXLO, PERU, &c. These possessions of the Spaniards and Portuguese excited other European nations to make attempts to share with them in their treasures, by planting colonies and

making settlements in the East and West Indies; and thus the rage of war was in some measure transferred from Europe to these distant regions; where, after various contests, the British at last obtained a great superiority.

In Europe the only considerable revolutions, of the fifteenth and sixteenth centuries, were the expulsion of the Moors and Saracens from Spain, by the taking of Grenada in 1491; the union of the kingdoms of Arragon and Castile, by the marriage of Ferdinand and Isabella; and the revolt of the states of Holland from the Spaniards. After much contention and bloodshed, these last obtained their liberty, and were declared a free people in 1609.

During the seventeenth century two very important revolutions took place in Great Britain, which, though they may seem to be of a local nature, merit particular notice in a general history of the world, on account of their important consequences to other nations. The bloody persecutions which had been carried on both in Scotland and England, on account of religion, about the commencement of the reformation, had awakened among mankind an attention to their civil as well as religious rights. The reformation was established in England: and the obstinate adherence to prerogative, on the part of the crown, produced so violent an op-position on that of the people, that the king was at last brought to the scaffold, and England for a short time became a commonwealth. See GREAT BRITAIN. When again the arbitrary measures of James II. would have restored both popery and a despotic monarchy, the glorious Revolution of 1688 was effected, by which those rights and privileges were established, which have ever been since the boast of Britons.

In the mean time most of those persons who had enigrated from Great Britain to America, on account of civil or religious persecution, heing of republican principles, and jealous of the smallest encroachments upon their rights, naturally instilled those principles into the minds of their children; and thus laid the foundation for that jealousy of power, and spirit of resistance to oppression, which afterwards excited the American war, and resulted in the independence of the UNITED STATES, which see.

SECT. XII.—FROM THE COMMENCEMENT OF THE AMERICAN WAR, TO THE CONCLUSION OF THE FRENCH REVOLUTIONARY WAR, BY THE PEACE IN 1801.

The consequences of this contest were the general diffusion of those principles, upon which the resistance of the Americans to the mother country was founded, throughout the different states of Europe, particularly in France, Germany, Holland, and Italy. Out of it arose the French Revolution.

In Asia, the taking of Constantinople by the Turks, and the rise of the British empire in Hindostan, are the only modern events of great importance. The Turks possess the western part of the continent called Asia Minor, to the Euphrates. The Arabs are again confined within their own peninsula; which they possess, as they have ever done, without owning subjection to any foreign power.

In Africa the Turks, partly in consequence of British provess and perseverance, still nominally possess Egypt, which they conquered in 1517. They have also a jurisdiction over the states of Barbary. On the western coasts are many settlements of European nations, particularly of the British and Portuguese; and the south extremity is permanently held by the former. The eastern coasts are almost entirely unknown.

The modern state of EUROPE will be best seen by a reference to that article; and the history of all its principal states sketched in their alphabetical places.

PART H.

OF ECCLESIASTICAL HISTORY.

This has indeed been hitherto rather the history of corrupt churches than of religion. It is perhaps best divided into Jewish and Christian church history: but the latter may be variously subdivided, as into the history of Christianity until its political establishment by Constantine; the rise and progress of the papal power; the superstition that disgraced the dark ages, &c. We shall adopt a chronological sub-division of this kind.

SECT. I .- OF THE JEWISH RELIGION.

From the time of the flood to the coming of Christ idolatry prevailed among all the nations of the world, the Jews excepted; and even they were on all occasions extremely ready to run into it, as is evident from their history in the Old Testament. At the time of Christ's appearance the religion of the Romans, as well as their empire, extended over a great part of the world. Various individuals among the heathens perceived the absurdities of that system : but being destitute of means, as well as of all enlightened and steady desire to effect a reformation, it was never attempted.

Two modifications of the Jewish religion at this time flourished in Palestine, viz. the Jewish, properly so called, and Samaritan; between whose respective followers reigned the most violent hatred. The difference between them seems to have been chieffy about the supreme or superior place of worship; which the Jews insisted to be Jerusalem, and the Samaritans mount Gerizim.

But, though the Jews were certainly right as to this point, they had greatly corrupted their religion. They indeed expected a saviour, but mistook his character; imagining that he was to be a powerful and a warlike prince, who should set them free from the Roman yoke. They also imagined that the whole of religion consisted in observing the rites of Noses, and some others which they had added to them; as is evident from the many charges our Saviour brings against the pharisees, who had the greatest reputation for sanctity. To these corrupt and vicious principles they added several absurd and superstitious notions concerning the divine nature, invisible powers, magie, &c., which they had

partly imbibed during the captivity in Babylon, and partly from their neighbours in Arabia, Syria, and Egypt. The principal sects among them were the ESENES, PHARISEES, and SADDUCEES: see these articles. The Samaritans, according to the most general opinion, had corrupted their religion still more than the Jews.

SECT. II.—HISTORY OF CHRISTIANITY, FROM ITS ORIGIN TO ITS ESTABLISHMENT BY CON-STANTINE THE GREAT.

When the true religion was preached by the Saviour of mankind, and his apostles, its rapid progress alarmed the Jews, and raised various persecutions against its followers. See the Acts of the Apostles, and the New Testament episties. The Jews, indeed, seem at first to have been every where the chief promoters of persecution : for the Heathen showed no very violent spirit of opposition against the Christians; though they were soon induced to hate them as much as the Jews themselves. Tacitus acquaints us with the causes of this. Nero, having set on fire the city of Rome, to avoid the imputation transferred it to the Christians. Our author informs us that they were already abhorred on account of their many and enormous crimes. 'The author of this name [Christians],' says he, 'was Christ, who, in the reign of Tiberius, was executed under Pontius Pilate, procurator of Judea. The pestilent superstition was for a while suppressed : but it revived again, and spread, not only over Judea, where this evil was first broached, but to Rome, whither from every quarter of the earth is constantly flowing whatever is hideous and abominable amongst men, and is there readily embraced and practised. First, therefore, were apprehended such as openly avowed themselves to be of that sect; then by them were discovered an immense multitude; and all were convicted, not of the crime of burning Rome, but of hatred and enmity to mankind. Their death and tortures were aggravated by cruel derision and sport; for they were either covered with the skins of wild beasts, and torn in pieces by devouring dogs, or fastened to crosses, or wrapped up in combustible garments, that, when the day-light failed, they might, like torches, serve to dispel the darkness of the night. Hence, towards the miserable sufferers, however guilty and deserving the most exemplary punishment, compassion arose; seeing they were doomed to perish, not with a view to the public good, but to gratify the cruelty of one man.'

That this account of Tacitus is downright misrepresentation, and calumny, must be evident to every one who reads it. It is impossible that any person can be convicted of hatred and enmity to mankind, without specifying the facts by which this hatred has shown itself. The burning of Rome would indeed have been a very plain indication of enmity to mankind, but of this Tacitus himself clears them, and mentions no other crime of which they were guilty.

The persecution under Nero was succeeded by another under Domitian; during which the apostle John was banished to Patmos, where he saw the visions, and wrote the book called Revelation, which completes the canon of Scripture. This persecution commenced in the ninety-fifth year of the Christian era.

During the first century the Christian religion spread over a great number of different countries; but as we have now no authentic records of the travels of the apostles, or the success which attended them, it is impossible to determine how far the gospel was carried. We are however assured that, even during this early period, many corruptions were creeping in, the progress of which was with difficulty prevented even by the apostles themselves.

The second century commences with the third year of Trajan. The Christians were still persecuted ; but, as the Roman emperors were for the most part of this century princes of a mild and moderate turn, they persecuted less violently than formerly. Yet Marcus Aurelius, notwithstanding the clemency and philosophy for which he is so much celebrated, treated the Christians worse than Trajan, Adrian, or even Severus himself, who was noted for his cruelty. This respite from rigorous persecution proved a very favorable circumstance for the spreading of the Christian religion; yet it is by no means easy to point out the particular countries through which it was diffused. We are, however, assured that, in the second century, Christ was worshipped as God almost through the whole east; as also among the Germans, Spaniards, Celtes, and many other nations. The writers of this century attribute the rapid progress of Christianity chiefly to the extraordinary gifts that were imparted to the first Christians, and the miracles which were wrought at their command. Many of the moderns, however, are so far from being of this opinion that they expressly deny the authenticity of all miracles said to have been wrought since the days of the apostles. To enter into the particulars of this controversy is foreign to our purpose, and we must refer to the writers who have treated of this point.

The corruptions which had been introduced in the first century, and which were almost coeval with Christianity itself, continued to gain ground in the second. Ceremonies, in themselves futile and useless, but which must be considered as highly pernicious when joined to a religion incapable of any other ornament than the upright and virtuous conduct of its professors, were multiplied for no other purpose than to please the multitude, or the immediate possessors of power. The immediate consequence of this was, that the attention of Christians was drawn aside from the important duties of piety and morality : and they were led to imagine that a careful observance of ceremonies might atone for the neglect of moral duties. This was the most pernicious opinion that could possibly be entertained; and was the foundation of that enormous system of ecclesiastical power which afterwards took place. Another corruption was the introduction of mysteries, as they were called, into the Christian religion; that is, insinuating that some parts of the worship in common use had a hidden efficacy and power, far superior to the plain and obvious meaning assigned to them by the vulgar : and, by paying peculiar respect to these mysteries, the pretended teachers of the religion of Jesus

accommodated their doctrines to the taste of their heathen neighbours, and obtained unbounded influence over their minds. They persuaded the people that the ministers of the Christian church succeeded to the character, rights, and privileges of the Jewish priesthood; and accordingly the bishops considered themselves as invested with a rank and character similar to those of the high priest among the Jews, while the presbyters represented the priests, and the deacons the Levites. This notion, which was first introduced in the reign of Adrian, proved a source of very considerable honor and profit to the clergy.

The form of ecclesiastical government was in this century rendered permanent and uniform. One inspector or bishop presided over each assembly, to which office he was elected by the voices of the whole people. To assist him in his office, he formed a council of presbyters, which was not confined to any stated number. To the bishops and presbyters the ministers or deacons were subject; and the latter were divided into a variety of classes. During a great part of this century the churches were independent of each other; or were joined together by no association, or confederacy, but that of charity. Each assembly was a little state governed by its own laws. But in process of time all the churches of a province were formed into one large ecclesiastical body, which, like confederate states, assembled at certain times, in order to deliberate about the common interests : this institution had its origin among the Greeks; but in a short time it became universal. The general assemblies, which consisted of the deputies or commissioners from several churches, were called synods by the Greeks, and councils by the Latins; and the laws enacted in them were termed canons, i. e. rules.

These councils, of which we find not the smallest trace before the middle of this century, changed the whole face of the church, and gave it a new form; for by them the ancient privileges of the people were diminished, and the power and authority of the bishops greatly augmented. At length they openly asserted that Christ had empowered them to prescribe to his people authoritative rules of faith and manners. Another effect of these councils was the gradual abolition of that perfect equality which reigned among bishops of the primitive times : for the order and decency of these assemblics required, that some one of the provincial bishops met in council should be invested with a superior degree of power and authority; and hence arose the rights of metropolitans. In the mean time the bounds of the church were enlarged; the custom of holding councils was followed wherever the sound of the gospel had reached; and the universal church had now the appearance of one vast republic formed by a combination of a great number of little states. Ecclesiastics were now appointed in different parts of the world as neads of the church, whose office it was to preserve the consistence and union of that immense body, whose members were so widely dispersed. Such was the nature and office of the patriarchs; among whom, at length, the bishop of Rome ssumed the title and authority of prince of the patriarchs.

During the second century the most remarkable of the sects which sprung up was the Ascetics. These owed their rise to a notion of some doctors of the church, that Christ had established a double rule of sanctity and virtue for two different orders of Christians. Of these, one was ordinary, the other extraordinary; the one of a lower dignity, the other more sublime : the first for persons in the active scenes of life; the other for those who, in a sacred retreat, aspired after the glory of a celestial state. They now therefore divided into two parts all those moral doctrines and instructions which they had received either by writing or tradition: one of these divisions they called precepts, and the other coun-The name of precepts they gave to those sels. laws that were universally obligatory; and that of counsels to those which related to Christians who proposed to themselves greater and more intimate communion with the Supreme Being.

They were d stinguished from other Christians, not only by their titles of Ascetics, $\Sigma \pi o v$ darot, Ekterot, and philosophers, but also by their garb. In this century, indeed, those who embraced such an austere kind of life submitted themselves to all these mortifications in private, without breaking asunder their social bands, or withdrawing themselves from mankind; but in process of time they retired into deserts, and, after the example of the Essenes and Therapeutæ, formed themselves into select companies.

At length the Ascetic sect, which began first to show itself in Egypt, passed into Syria and the neighbouring countries, and reached the European nations; hence that train of austere and superstitious vows and rites which totally obscured, or almost annihilated, Christianity; the celibacy of the clergy, and many other absurdities. The errors of the Ascetics, however, did not stop here : in compliance with the doctrines of some Pagan philosophers, they affirmed, that it was not only lawful, but even praise-worthy, to deceive, and to use the expedient of a lie, in order to advance the cause of piety and truth: thus arose the pious frauds for which the church of Rome has been notorious, and which in modern times she has often attempted to revive.

As Christians thus deviated more and more from the true practice of their religion, they became more zealous in the external profession of it. Anniversary festivals were celebrated in commemoration of the death and resurrection of Christ, and of the effusion of the Holy Ghost on the apostles. Concerning the days on which these festivals were to be kept there arose violent contests. The Asiatic churches in general differed in this point from those of Europe : and, towards the conclusion of the second century, Victor, bishop of Rome, insisted upon the castern churches following the rules laid down by the western ones. This they absolutely refused to do: upon which Victor cut them off from communion with Rome; but the difference was after a time adjusted.

During most of the third century the Christians were allowed to enjoy their religion, with-

out molestation. The emperors Maximinus and Decius, indeed, made them feel the rigors of a severe persecution; but their reigns were short, and from the death of Decius to the time of Dioclesian the church enjoyed tranquillity.

Several alterations were now made in the manner of celebrating the Lord's supper. The prayers used on this occasion were lengthened, and the solemnity and pomp with which it was attended were considerably increased. Gold and silver vessels were used in the celebration; it was thought essential to salvation, and for that reason administered even to infants .--- Baptism was celebrated twice a year to such as, after a long course of trial and preparation, offered themselves candidates. The remission of sins was thought to be its immediate consequence; while the bishop, by prayer and imposition of hands, was supposed to confer those sanctifying gifts of the Holy Ghost that are necessary to a life of righteousness and virtue. An evil demon was supposed naturally to reside in every person, who was the author and source of all the corrupt dispositions and unrighteous actions of that person. The driving out of this demon was therefore an essential property of baptism; and, in consequence of this opinion, the baptized persons returned home clothed in white garments, and adorned with crowns, as sacred emblems; the former of their inward purity and innocence, and the latter of their victory over sin and the world. Fasting also began now to be held in more esteem than formerly, and the sign of the cross also was supposed to administer a victorious power over all sorts of trials and calamities. The heresies which troubled the church, during this century, were those of the GNOSTICS, whose doctrines were new modelled and improved by Manes, from whom they were afterwards chiefly called Manicheans, the HIERA-CITES, NOETIANS, SABELLIANS, and NOVATIANS; for an account of which, see these articles.

The fourth century is remarkable for the establishment of Christianity by law in the Roman empire; which, however, did not take place till the year 324.

SECT. III.—HISTORY OF THE CHURCH OF ROME FROM ITS ESTABLISHMENT TO THE ERECTION OF THE POPE'S SUPREMACY BY PHOCAS.

The civil establishment of the Christian religion, however favorable to the outward peace of the church, was far from promoting either its internal harmony, or the reformation of its leaders. The clergy, who had all this time been augmenting their power at the expense of the liberty of the people, now set no bounds to their ambition. The bishop of Rome was the first in rank, and distinguished by a sort of preeminence above the rest of the prelates. Hence it happened, that when a new pontiff was to be chosen by the presbyters, the city of Rome was generally agitated with dissentions, tumults, and cabals. The intrigues and disturbances which prevailed in that city in the year 366, when, upon the death of Liberius, another pontiff was to be chosen in his place, are a sufficient proof of this. Upon that occasion, one faction elected

Damasus to that high dignity; while the opposte party chose Ursicinus, a deacon of the vacant church, to succeed Liberius. This double election gave rise to a dangerous schism, and to a sort of civil war within the city; which was carried on with the utmost barbarity and fury, and produced the most cruel massacres and desolations. The inhuman contest ended in the victory of Damasus.

But the bishops of Rome had not yet acquired that pre-eminence of power and jurisdiction which they afterwards enjoyed. They were citizens as well as their brethren, and subject, like them, to the laws and edicts of the emperors. Even the ecclesiastical laws were enacted either by the emperor or councils, and none of the bishops acknowledged that they derived their authority from the permission or appointment of the bishop of Rome. About A.D. 372, however, Valentinian enacted a law, empowering that bishop to examine and judge other bishops, that religious disputes might not be decided by any profane or secular judges, and certain prelates, assembled in council at Rome in 378, recommended the execution of it in their address to the emperor Gratian.

The removal of the seat of empire to Constantinople, however, raised up, in the bishop of this new metropolis, a formidable opponent to the bishop of Rome. For as the emperor, to render Constantinople a second Rome, enriched it with all the rights and privileges of the ancient capital of the world; so its bishop, measuring his own dignity and rank by the magnificence of the new city, and its eminence as the residence of the emperor, assumed an equal degree of dignity with the bishop of Rome, and claimed a superiority over the rest of the episcopal order. Accordingly, in a council held at Constantinople in 381, by the authority of Theodosius the Great, the bishop of that city was, during the absence of the bishop of Alexandria, and against the consent of the Roman prelate, placed, by the third canon of that council, in the first rank after the bishop of Rome.

Nectarius was the first bishop who enjoyed these new honors of the see of Constantinople. His successor, the celebrated John Chrysostom, extended still farther the privileges of that see, and included within its jurisdiction all Thrace, Asia, and Pontus; nor were the succeeding bishops of that imperial city deficient in zeal to augment their privileges and extend their dominion. Thus the bishops of Alexandria were not only filled with the most inveterate hatred against those of Constantinople, but a contention was excited between the bishops of Rome and the latter; which, after being carried on for many ages, terminated in the separation of the Greek and Latin churches.

By the arrangements of Constantine the four bishops of Rome, Constantinople, Antioch, and Alexandria, were distinguished by a certain degree of pre-eminence over the rest. These four prelates answered to the four prætorian prefects, and it is probable, that even in this century they were distinguished by the Jewish title of patriarchs. After these followed the exarchs, who nad the inspection of several provinces, and an-

swered to the appointment of certain civil efficers who bore the same title. In a lower class were the metropolitans, who had only the government of one province; under whom were the archbishops, whose inspection was confined to certain districts. In this gradation the hishops brought up the rear; but the sphere of their authority was not in all places equally extensive; being in some considerably ample, and in others confined within narrow limits. To these various ecclesiastical orders we might add that of the chorepiscopi, or superintendants of the country churches; but this last order was in most places suppressed by the bishops, with a design to extend their own authority, and enlarge the sphere of their power and jurisdiction.

The administration of the church was divided by Constantine into an external and internal inspection. The latter, which was committed to bishops and councils, related to religious controversies, the forms of divine worship, the offices of priests, the vices of the ecclesiastical orders, &c. The external administration of the church the emperor assumed to himself. This comprehended all those things which related to the outward state and discipline of the church; it likewise extended to all contests that should arise between the ministers of the church, superior as well as inferior, concerning their possession, their reputation, their rights and privileges, their offences against the laws, &c., but no controversies that related to matters purely spiritual were cognizable by this external inspection. In consequence of this division of the ecclesiastical government, Constantine and his successors called councils, presided in them, appointed the judges of religious controversies, terminated the differences which arose between the bishops and the people, fixed the limits of the ecclesiastical provinces, took cognizance of the civil causes that subsisted between the ministers of the church, and punished the crimes committed against the laws by the ordinary judges appointed for that purpose. But this famous division of the administration of the church was never explained with sufficient accuracy; so that, both in the fourth and fifth centuries, there are frequent instances of the emperors determining matters purely ecclesiastical, and likewise of bishops and councils determining matters which related merely to the external form and government of the church.

Many additions were now made by the emperors and others to the wealth and honors of the clergy; and the bishops contended with each other in the most scandalous manner concerning the extent of their respective jurisdictions: while they trampled on the rights of the people, and the privileges of the inferior ministers. In many places, however, the presbyters assumed an equality with the bishops in point of rank, and many complaints are made by authors in this century of the vanity and effeminacy of the deacons.

In the fifth century the bishops of Constantinople, having already reduced under their jurisdiction all the Asiatic provinces, began to grasp at further accessions of power. By the twentyeighth canon of the council of Chalcedon, it was

resolved, that the same rights and honors which had been conferred on the bishop of Rome were due to the bishop of Constantinople, on account of the equal dignity and lustre of the two cities. The same council confirmed also, by a solemn act, the bishop of Constantinople in the spiritual government of those provinces over which he had usurped the jurisdiction. Leo the Great, bishop of Rome, opposed with vehemence the passing of these laws; and his opposition was seconded by that of several prelates. But their efforts were vain, as the emperors threw their weight into the balance, and thus supported the decisions of the Grecian bishops. In consequence of the decisions of this council, the bishop of Constantinople began to domincer over the bishops of Antioch and Alexandria.

About this time Juvenal, bishop of Jerusalem, also attempted to withdraw himself and his church from the jurisdiction of the bishop of Cæsarea, and aspired after a place among the first prelates of the Christian world. Encouraged by the protection of Theodosius the younger, this aspiring prelate assumed the dignity of patriarch of all Palestine, and usurped a jurisdiction over the provinces of Phœnicia and Arabia. Hence arose a warm contest between Juvenal and Maximus bishop of Antioch; which the council of Chalcedon decided, by restoring to the latter the provinces just mentioned.

In 588 John bishop of Constantinople, surnamed the Faster, either by his own authority or that of the emperor Mauritius, summoned a council at Constantinople to enquire into an accusation brought against Gregory bishop of Antioch; and upon this occasion assumed the title of œcumenical or universal bishop. This title had been enjoyed by the bishops of Constantinople without any offence; but now Gregory the Great, then bishop of Rome, suspecting that John was aiming at a supremacy over all the churches, opposed his claim with great vigor. For this purpose he wrote to the emperor, and others whom he thought capable of assisting him in his opposition ; but all his efforts were without effect; and the bishops of Constantinople were allowed to enjoy the disputed title, though not in the sense which had alarmed the Roman pontiff.

In the beginning of the seventh century Boniface III. engaged Phocas, emperor of Constantinople, to take from the bishop of that metropolis the title of œcumenical or universal bishop, and to confer it upon the Roman pontiff; and thus was first introduced the supremacy of the pope.

Sect. V.—History of the Church of Rome from the Erection of the Pope's Supremacy to his Assumption of Universal Power.

In the eighth century the power of the bishop of Rome, and of the clergy in general, prodigiously increased. A chief cause of this, besides the superstition of the people, was the peculiar difficulties of European princes in securing themselves on their thrones. The whole contrnent being in the most unsettled and barbarous condition, they endeavoured to attach

VOL. XI.

warmly to their interests those whom they considered as their friends and clients. For this purpose they distributed among them extensive territories, cities, and fortresses, with the various rights and privileges belonging to them; reserving only to themselves the supreme dominion and military service. For this reason it was, by the European princes, reckoned a high instance of political prudence to distribute among the bishops and other Christian doctors the same sort of donations which had formerly been given to their generals and clients. By means of the clergy they hoped to check the seditious and turbulent spirits of their vassals; and to maintain them in their obedience by the influence and authority of their bishops.

This prodigious accession to the opulence and authority of the clergy in the west began at their head, viz. the Roman pontiff; whence it spread gradually among the inferior sacerdotal orders. The barbarous nations, who had received the gospel, looked upon the bishop of Rome as the successor of their chief druid or high priest: and the see of Rome arrived at despotic authority in civil and political matters. Hence arose the monstrous opinion, that such persons as were excluded from the communion of the church by the pontiff, or any of his bishops, forfeited thereby not only their civil rights and advantages as citizens, but even the common claims and privileges of humanity. This was the fatal source of wars, massacres, and rebellions, without number.

We have seen, in the annals of France, the important influence of the Roman pontiff in confirming the usurpation of Pepin. He dissolved the obligation of the oath of fidelity and allegiance which Pepin had sworn to Childeric, and anointed and crowned him king. This complaisance of the pope was rewarded with the exarchate of Ravenna and its dependencies.

In the succeeding centuries the Roman pontiffs continued to increase their power by every kind of artifice; and by continually taking advantage of the civil dissensions which prevailed throughout Italy, France, and Germany. The wisest and most impartial among the Roman Catholic writers acknowledge, that, from the time of Louis the Meek, the ancient rules of ecclesiastical government were gradually changed in the courts of Europe by the counsels and instigation of the church, and new laws substituted in their places. The European princes suffered themselves to be divested of the supreme authority in religious matters, which they had derived from Charlemagne; the power of the bishops was greatly diminished; and even the authority of both provincial and general councils began to decline.

The popes were now eagerly bent upon establishing the maxim, That the bishop of Rome was constituted and appointed by Jesus Christ supreme legislator and judge of the church; and did not scruple to employ some of their most ingenious and zealous partizans in forging conventions, acts of councils, epistles, and other records, by which it might appear, that, in the first ages of the church, the Roman pontiffs were clothed with the same supreme authority which they now assumed. In the eleventh century their power seems to have risen to its utmost height. They now received the pompous titles of Masters of the World, and Universal Fathers. They presided over every council by their legates, assumed the authority of supreme arbiters in all controversies that arose concerning religion or discipline, and maintained the pretended rights of the church against the encroachments and usurpations of kings and princes. Their authority was confined, however, within certain limits; both by sovereign princes, that it might not attain universal civil dominion; and by the bishops who were galled by its spiritual despotism.

From the time of Leo IX, the popes employed every method which the most artful ambition could suggest to pass these limits. We find instances of their giving away kingdoms, and loosing subjects from their allegiance to their sovereigns; among which the history of John, king of England, is very remarkable. At last they plainly affirmed the whole earth to be within their jurisdiction; and, on the discovery of America and the East Indies, granted we know to the Portuguese a right to all the countries lying eastward, and to the Spaniards all those lying to the west of Cape Non in Africa.

SECT. VI.—OF VARIOUS SUPERSTITIONS WHICH PREVAILED, FROM THE FIFTH CENTURY TO THE REFORMATION.

All this time superstition reigned triumphant over those remains of Christianity which had escaped the corruptions of the first four centuries. In the fifth commenced the invocation of the souls of departed saints. Their assistance was entreated by many fervent prayers, and the images of those who, during their lives had acquired the reputation of sanctity, were honored with worship in several places. A singular and irresistible efficacy was also attributed to the bones of martyrs, and to the figure of the cross, in defeating the attempts of Satan, and removing all sorts of sickness and calamities. The famous Pagan doctrine concerning the purification of departed souls by means of a certain kind of fire, i. e. purgatory, was also fully received and explained.

In the sixth century Gregory the Great advanced an opinion, that all the words of the sacred writings were images of invisible and spiritual things; for which reason he loaded the churches with a multitude of ceremonies the most insignificant and futile that can be imagined : hence arose a new and most difficult science, namely, the explication of these ceremonies, and the investigation of the causes and circumstances whence they derived their origin. A new method was contrived of administering the Lord's Supper, with a magnificent assemblage of pompous rites. This was called the canon of the mass. Baptism, except in cases of necessity, was administered only on the great festivals. An incredible number of temples were erected in honor of the saints. The places set apart for public worship were also very numerous, and almost equalled in number by the festivals invented to bring the Christian religion as near the model of paganism as possible. In the seventh

century religion seemed to be altogether buried under a heap of superstitious ceremonies; the worship of the true God and Saviour of the world was exchanged for the worship of bones, bits of wood (said to be of the cross), and the images of saints. The piety of this and some succeeding ages consisted in building and embellishing churches and chapels; in endowing monasteries and basilies; hunting after the relics of saints and martyrs, and treating them with an absurd and excessive veneration; in pilgrimages to those places which were esteemed holy, particularly to Palestine, &c. The genuine religion of Jesus was now utterly unknown both to clergy and people, if we except a few of its doctrines contained in the creed. In this century, also, the superstitious custom of solitary masses had its origin. These were celebrated by the priest alone in behalf of souls detained in purgatory, as well as upon some other occasions. They proved a source of immense wealth to the clergy, though under Charlemagne they were condemned by a synod assembled at Mentz.

A new superstition, however, sprung up in the tenth century. It was imagined, from Rev. xx. 1, that Antichrist was about to make his appearance on the earth, and that soon after the world would be destroyed. A universal panic ensued; vast numbers of people, abandoning all their connexions in society, and giving over to the churches and monasteries all their worldly effects, repaired to Palestine, where they imagined that Christ would descend from heaven to judge the world. Others devoted themselves by a solemn and voluntary oath to the service of the churches, convents, and priesthood, whose slaves they became, in the most rigorous sense of that word, performing daily their heavy tasks; and all this from a notion that the supreme judge would diminish the severity of their sentence, and look upon them with a favorable and propitious eye, on account of their having made themselves the slaves of their minister. When an eclipse of the sun or moon happened to be visible, the cities were deserted, and their miserable inhabitants fled for refuge to hollow caverns, and hid themselves among the craggy rocks, and under the bending summits of steep mountains. The opulent attempted to bribe the saints and the Deity himself by rich donations conferred upon the sacerdotal tribe, who were looked upon as the immediate vicegerents of heaven. In many places temples, palaces, and noble edifices, both public and private were suffered to decay, nay, were deliberately pulled down, from a notion that they were no longer of any use, as the final dissolution of all things was at hand. No language, in a word, is sufficient to express the confusion and despair that tormented. the minds of miserable mortals upon this occasion. This terror became one of the accidental causes of the crusades.

That nothing might now be wanting to complete the reign of antichrist in Europe, it was in the eleventh century determined that divine worship should be celebrated in the Latin tongue, though now unknown throughout the continent: and, during a great part of this century, Christians were employed in rebuilding and ornamenting their churches, which they had destroyed through the superstitious apprehensions of the previous period.

The ecclesiastical affairs of Europe thus proceeded till the time of the Reformation. The clergy were immersed in crimes and barbarism; and the laity, imagining themselves able to purchase pardon of their sins for money, followed the example of their pastors without remorse; while the absurd principle, that religion consists in acts of austerity, and an unknown mental correspondence with God, produced the most extravagant and ridiculous behaviour in devotees and reputed saints. They not only lived among the wild beasts, but also after the manner of those savage animals; they ran naked through the deserts, and aped the agitations of madness and frenzy; avoided the sight and conversation of men; remained almost motionless in certain places for years, exposed to the rigor and inclemency of the seasons, and, towards the conclusion of their lives, shut themselves up in narrow and miserable huts: all this being considered as true piety, and the only acceptable method of worshipping the Deity.

About the beginning of the sixteenth century, the Roman pontiffs enjoyed the utmost tranquillity; nor had they, according to the appearance of things at that time, any reason to fear opposition to their authority. The commotions which had been raised by the Waldenses, Albigenses, &c., were now entirely suppressed, and the world bowed to their power. We must not however conclude, from this apparent security of the pontiffs and their adherents, that their measures were universally applauded. Not only private persons, but also the most powerful princes and sovereign states, exclaimed loudly against the tyranny of the popes, and the unbridled licentiousness of the clergy. They demanded, therefore, a reformation of the church in its head and members, and a general council to accomplish it. But these complaints and demands produced little effect; they came from persons who never entertained the least doubt about the supreme authority of the pope; and who of consequence, instead of attempting themselves to bring about that reformation which was so ardently desired, remained entirely inactive, or looked only for redress to those who were interested in perpetuating abuses.

While the so much desired reformation seemed to be at the greatest distance, it suddenly rose, however, from a quarter whence it was not at all expected. Martin Luther, a monk of the order of St. Augustine, ventured to oppose himself to the whole torrent of papal power and despotism. This bold attempt was first made public on the 30th of September 1517; and, notwithstanding all the efforts of the pope and his adherents, the doctrines of Luther continued daily to gain ground. Others, encouraged by his success, lent their assistance in the work of reformation ; which at last produced new churches, founded upon principles quite different from that of Rome, and which still continue. But for an account of the transactions of the reformers, and the more modern history of the church, see LUTHER and REFORMATION.

PART III.

OF THE COMPOSITION OF HISTORY.

Having thus furnished the reader with a sketch of the two great practical views of our subject, we may advert to the art of composing history, as it has been treated by Cicero and others.

The requisites mentioned by that great writer may be arranged under four heads, Truth, Subject, Order, and Style.

SECT. I .-- OF HISTORICAL TRUTH.

Truth is the basis and foundation of history. It is the life and soul of it, and that by which it is distinguished from fable or romance. An historian therefore ought not only to be a man of probity, but void of all passion or bias. He must have the stead ness of a philosopher, joined with the vivacity of the poet and orator. Without the former, he will be insensibly swayed by some passion to give a false coloring to the actions or characters he describes, as favor or dislike to parties or persons affects his mind. And, without the latter, his descriptions will be flat and cold.

But historical truth consists of two parts, one is, Not to state any thing we know to be false. Nor is it sufficient to excuse an historian, in relating a falsehood, that he did not know it to be so when he wrote, unless he first used all the means in his power to inform himself of the We are informed of Thucydides, that truth. when he wrote his history of the Peloponnesian war, he did not satisfy himself with the best accounts he could obtain from his countrymen the Athenians, fearing they might be partial in their own cause; but spared no expense to inform himself how the same facts were related by their enemies the Lacedæmonians. And Polybius travelled into Africa, Spain, Gaul, and other parts of the world, to write his history of the Roman affairs.

The other branch of historical truth is, Not to omit any thing that is true, and necessary to set the matter treated of in a clear and full light. In the actions of past ages or distant countries, wherein the writer has no personal concern, he can have no great inducement to break in upon this rule. But, where interest or party is engaged, it requires no small candor, as well as firmness of mind, constantly to adhere to it. Affection to some, aversion to others, fear of disobliging the friends of those in power, &c., will often interpose and try his integrity. Besides, an omission is less obnoxious to censure than a false assertion; for the one may be easily ascribed to ignorance or forgetfulness; whereas the other will, if discovered, be commonly looked upon as design. He, therefore, who in such circumstances, from a generous love to truth, is superior to all motives to betray or stifle it, justly deserves the character of an honest historian.

Polybius says on this head, 'A good man ought to love his friends and his country, and to have a like disposition with them, both towards their friends and enemies. But when he takes upon him the character of an historian they must all be forgot.' Integrity is undoubtedly the principal qualification of an historian; when we can depend upon this, other imperfections are more easily passed over. Suetonius is said to have written the lives of the twelve C ∞ sars as free from external influence as they themselves lived. What better character can be given of a writer?

Sometimes, indeed, a judgment may be formed of the veracity of an author, from his manner of expressing himself, and a certain candor and frankness, always uniform and consistent, that runs through his writings.

Thus, where things are uncertain because of their being reported various ways, it is partiality in an historian to give the most unfavorable account, where others are as well known and equally credible. Again, it is a proof of the same bad spirit when the facts themselves are certain and evident, but the design and motives of those concerned in them are unknown and obscurc, to assign some ill principle, such as avarice, ambition, malice, interest, or some other vicious habit, as the cause of them.

SECT. II .- OF THE SUBJECT OF HISTORY.

By the subject of history we mean facts themselves, together with such matters as are either connected with them, or may at least is requisite to set them in a just and proper light. But, although the principal design of history is to record facts, yet all facts do not merit the regard of an historian; but such only as may be thought of use in regulating human conduct. Nor is it allowable for him, like the poet, to form the plan and scheme of his work as he pleases. His business is to report things as he finds them, without coloring or disguise.

Some histories afford more entertainment than others, from the nature of the events which they record; and it may be esteemed the happiness of an historian to meet with such a subject, but it is not his fault if it be otherwise. Thus Herodotus begins his history with showing, that the barbarians gave the first occasion to the wars between them and the Greeks, and ends it with an account of the punishment which, after some ages, they suffered from the Greeks on that account. Such a relation must not only have been agreeable to his countrymen the Grecians, for whose sakes it was written; but likewise very instructive, by informing them of the justice of Providence in punishing public injuries in this world, wherein societies, as such, are only capable of punishment. On the other hand, Thucydides begins his history with the unhappy state of his countrymen the Athenians; and in the course of it plainly intimates, that they were the cause of the calamitous war between them and he Lacedæmonians : Whereas, had he been more inclined to please and gratify his countrymen than to convey the truth, he would have endeavoured to make their enemies appear the aggressors.

Cicero observes, justly, that history 'is conversant in great and memorable actions.' For this reason an historian should always keep posterity in view; and relate nothing which does not seem worth the notice of after ages. To descend to trivial and minute matters, such as frequently occui in the commen affairs of life, is below the

dignity of historical composition. Pliny the younger has some fine reflections upon this subject : 'You advise me,' says he, 'to write a history; and not you only, for many others have done the same, and I am myself inclined to it. Not that I believe myself qualified for it, which would be rash to think till I have tried it; but because I esteem it a generous action not to suffer those to be forgotten whose memory ought to be eternised; and to perpetuate the names of others, together with one's own. For there is nothing I am so desirous or ambitious of, as to be remembered hereafter; which is a thing worthy of a man, especially of one who, conscious of no guilt, has nothing to fear from posterity.' And when Dion Cassius has mentioned some things of less moment in the life of Commodus, chiefly indeed filled up with cruelty and folly, he thus apologises for himself :- 'I would not have it thought that I descend below the gravity of history in writing these things : for, as they were the actions of an emperor, and I was present and saw them all, and both heard and conversed with him, I did not think it proper to omit them.' He seems to think those actions, when performed by an emperor, might be worth recording, which, if done by a person of inferior rank, would not have deserved notice.

But, although facts in general are the proper subject of history, they may be differently considered with regard to the extent of them, as they relate either to particular persons or communities of men. And from this consideration history has been distinguished into three sorts, biography, and particular and general history. Writing the lives of single persons is called biography. By particular history is meant that of particular states, whether for a shorter or longer space of time. And general history contains an account of several states existing together in the same period of time.

The general subject, or argument of history, in its several branches, may be reduced to narration, reflection, speeches, and digressions.

1. By *narration* is meant a description of facts or actions, with such things as are necessarily connected with them; namely, persons, time, place, design, and event.

But an accurate historian goes still further, and considers the causes of actions, and what were the designs and views of those who were principally concerned in them. Some, as Polybius has well observed, are apt to confound the beginnings of actions with their springs and causes, which ought to be carefully separated. For the causes are often very remote, and to be looked for at a considerable distance from the actions themselves. Thus, as he tells us, some have represented Hannibal's besieging Saguntum in Spain, and passing the Ebro, contrary to a former agreement between the Romans and Carthaginians, as causes of the second Punic war. But these were only the beginnings of it. The true causes were the jealousies and fears of the Carthaginians from the growing power of the Romans; and Hannibal's inveterate hatred to them, with which he had been impressed from his infancy.

Again, the true springs and causes of actions

are to be distinguished from such as are only feigned and pretended. For, generally, the worse designs men have in view, the more solicitous they are to cover them with specious pretences. It is the historian's business, therefore, to lay open and expose to view these arts of politicians. So, as the same judicious historian remarks, we are not to imagine Alexander's carrying over his army into Asia to have been the cause of the war between him and the Persians. Philip, his father, made preparations for it, but did not live to execute it. That was left for his son. But, as Philip could not have done this without first bringing the other states of Greece into his design, his pretence to them was only to avenge the injuries they had suffered from the Persians.

Lastly, an historian should relate the issue and event of the actions he describes. This is undoubtedly the most useful part of history; since the greatest advantage arising from it is to teach us experience from what has happened. When we learn from the examples of others the happy effects of wisdom, prudence, integrity, and other virtues, it naturally excites us to imitate them, and to pursue the same measures in our own conduct. Polybius therefore observes, that 'he who takes from history the causes, manner, and end of actions, and omits to take notice whether the event was answerable to the means made use of, leaves nothing in it but a bare amusement, without any benefit or instruction.'

2. Reflections made by the writer have been both extravagantly applauded and unreasonably condemned. If the philosopher is allowed to draw inferences from his precepts, and their effects on society, why should not the historian have an equal right to make reflections upon the facts he relates? The reader is equally at liberty to judge for himself in both cases: we therefore find, that the best historians have taken this liberty. Thus Livy makes a very beautiful observation upon the ill conduct of Hannibal in quartering his army in Capua after the battle of Cannæ. ' Those,' says he, ' who are skilled in military affa is reckon this a greater fault in the general, than his not marching his army immediately to Rome after his victory at Cannæ; for such a delay might have seemed only to defer the victory, but this ill step deprived him of the power to gain it.'-Lib. xxiii. c. 18.

Lord Gardenstone, on the other hand, remarks of Mr. Hume, that 'his account of the house of Stuart is not the statement of an historian, but the memorial of a pleader in a court of justice.' --Gard. Miscell. p. 305.

3. Speeches inserted by historians are of two sorts, namely, oblique and direct. The former are such as the historian recites in his own person, and not in that of the speaker. Of this kind is that of Hannibal in Justin, by which he endeavours to persuade king Antiochus to carry the seat of the war against the Romans into Italy. It is rather a narrative of the operations of Hannibal's mind.

In direct speeches, the person himself is introduced as addressing his audience; and therefore the words as well as the sense are suited to his character. Such is the speech of Eumenes, one of Alexander's captains and successors, made

to his soldiers when they had traitorously bound him in chains, to deliver him up to his enemy Antigonus, in the same author.

After all, this is a matter on which critics are divided; whether any, or what kind of speeches, ought to be allowed in history. Some think all should be excluded, as breaking the thread of the discourse. Others only object to what have been called direct speeches, as generally any thing but real ones. Thus when Livy, for example, gives us the speeches of Romulus, the Sabine women, Brutus, and others, in the first ages of the Roman state, both the things themselves are imaginary, and the language wholly incongruous with the times in which the parties lived. However, there is scarcely an ancient historian now extant, either Greek or Latin, who has not inserted several speeches in his works, both oblique and direct.

4. Digressions, if properly managed, afford the reader both pleasure and advantage. Like speeches, they should neither be too long nor frequent; lest they interrupt the course of the bistory, and divert the reader from the main design. But now and then to introduce a beautiful description, or some remarkable incident, which may throw light on the subject, is so far from an interruption, that it is rather a relief to the reader, and excites him to go on with greater pleasure and attention. See ORATORY.

SECT. III .- OF ORDER.

As most histories consist of an introduction, and the body of the work, in each of which some order is requisite, we shall treat of them separately.

1. The design of the introduction is the same here as in orations. For the historian proposes three things by his introduction, which may be called its parts: 1. To give his reader some general view of the subject; 2. To engage his attention, and to possess him with a favorable opinion of himself and his performance. Livy's introduction has been very much applauded by the learned, as a master-piece. It gives the follow-ing account of his design :-- 'Whether,' says he, 'it may answer any valuable end for me to write the history of the Roman affairs from the beginning of the city, I neither am certain, nor, if I was, should I venture to declare it.' He then endeavours to prepare the reader's attention, by representing the grandeur and usefulness of the subject. 'Either I am prejudiced in favor of my subject, or there never was any state greater, more virtuous, or more fruitful of good examples, or in which avarice and luxury had a later admittance, or poverty and thriftiness were either more highly or longer esteemed.' And then he proceeds to ingratiate himself with his readers. Although my name is obscure, in so great a number of writers, yet it is a comfort that they cloud it by their fame and character. For I shall gain this advantage by my labor, that I shall be diverted for a time from the prospect of those evils which the present age has seen ; while my mind is wholly intent upon former times, and free from all that care which gives the writer uneasiness, though it cannot bias him against the truth.' Sallust is greatly blamed by Quantilian on account of his introductions, which are so general, that they might suit other histories as well as those to which they are prefixed. Introductions should likewise be proportioned to the length of the work. We meet with some few histories, in which the writers immediately enter upon their subject, without any introduction; as Xenophon in his Expedition of the younger Cyrus, and Cæsar in his Commentaries of the Galaic and Civil Wars. But the latter does not profess to write a history; and therefore left himself more at liberty, as well in this respect as in some others.

2. But order is principally to be regarded in the body of an historical work. And this may be managed two ways; either by attending to the time in a chronological series, or the different nature and circumstances of the things contained in the history.

In a general history the order of time cannot always be preserved ; though, where the actions of different communities have respect to one as the principal, they should all, as far as possible, be referred to the transactions of that state. But even here the several affairs of those different states ought to be related separately, which will necessarily occasion the anticipating some things, and postponing others, so that they cannot all stand in the exact order of time in which they were performed. However, Velleius Paterculus says very justly, 'Every entire action, placed together in one view, is much better apprehended than if divided by different times.' In this case, therefore, for better preserving the chronology, it is usual with historians, when they have finished any particular narrative, in passing to the next, to express the time by some short and plain transition.

The division of histories into books was designed for the better distinction of the subject, and ease of the reader. The dividing these books into chapters is rather a practice of modern editors, founded on similar reasons, than countenanced by the example of ancient authors.

SECT. IV .- OF STYLE.

An historical style is said to be of a middle nature, between that of a poet and orator, differing from both, not only in the ornamental parts, but also in the idioms and forms of expression. Cicero observes (De Clar. Orat. c. 75) 'that nothing is more agreeable in history than brevity of expression, joined with purity and perspi-cuity.' Purity indeed is not peculiar to history, but yet is absolutely necessary; for nobcdy will think him fit to write a history, who is not master of the language in which he writes: when Albinus, therefore, had written a history of the Roman affairs in Greek, and apologised for any improprietics that might be found in the language upon the account of his being a Roman, Cato called him a trifler, for choosing to do that which, after he had done it, he was obliged to

ask pardon for doing. Nor is perspicuity less requisite in an historical style. The nature of the subject plainly directs to this; for, as history consists principally in narration, clearness and perspicuity is no where more necessary.

Cicero again, treating of an historical style (De Orat. lib. ii. c. 15, 20), says, 'It ought to be fluent, smooth, and even; free from that harshness and poignancy which is usual at the bar.' The historian has no necessity for the variations of the declaimer. It is his province to espouse no party, to have neither friend nor foe, but to appear disinterested and indifferent to all; his language, therefore, should be smooth and equal.

Dionysius (Epist. ad. Cn. Pompeium) makes ' decency a principal virtue in an historian;' which he explains by saying, that 'he ought to preserve the characters of the persons and dignity of the actions of which he treats.' To do this it is necessary, that an historical style should be animated with a degree of life and vigor; with out which neither the characters of eminent persons, nor their remarkable actions, can be duly represented : for even things in themselves great and excellent, if related in a cold and lifeless way, will not affect us in a degree suitable to their importance. Whence it appears, that painting and imagery make up no small part of the historian's province, though his colors must not be so strong and glittering as those of either the poet or the orator.

As to dignity in the use of tropes and figures, the same author says, ' History should be embellished with such figures as are neither vehement, nor carry in them the appearance of art.' This is agreeable to what Cicero observes, in comparing Xenophon and Callisthenes : ' Xenophon the Socratic,' he says, ' was the first philosopher, and after him Callisthenes, the scholar of Aristotle, who wrote a history : the latter is almost a rhetorician; but the style of the former is more moderate, and has not the force of an orator; i is less vehement, perhaps, but in my opinion, more sweet and agreeable.' The difference between these two writers, with regard to their style, consisted chiefly in the choice of their fi gures. An historical style admits indeed of end less varieties, according to the nature and dignity of the subject. The lives of particular persons do not require such strength and majesty of expression, nor such ornaments of language, as a history of the Roman empire. And accordingly we find the style of Nepos and Suetonius very different from that of Livy. The former is smooth and easy; but the latter often approaches near to the sublime; other historians again have kept a medium between these. Upon the whole, therefore, we may conclude, that the middle style is generally the proper one for history : but a variety and flexibility of style is not only requisite in different subjects, but likewise in different parts of the same work

HISTRION'ICALLY, adv.) the stage; suitable to a player; becoming a buffoon; theatrical.

HIT, v. a., v. n., & n. s. Goth. and Swed. hetta; Dan. hitti: Minsheu says from Lat ictus. To strike; to touch with a blow; to touch the mark; to attain or reach; to be conformable or adapted ; to catch by the right bait : to hit off is to determine luckily: to hit out to perform by good luck : also, to clash; to chance; to succeed; to light on : a stroke; a fortuitous event; a lucky chance.

And king Emetrius, for all his strengthe Is borne out of his sadel a swerdes lengthe : So hitte him Palamon, or he were take :-

But all for naught : he was brought to the stake. Chaucer. The Knightes Tale.

Having the sound of ancient poets ringing in his ears, he mought needs in singing hit out some of their tunes. Spenser.

Oft expectation fails, and most oft there

Where most it promises ; and oft it hits

Where hope is coldest and despair most sits. Shaksp. Were I but twenty-one,

Your father's image is so hit in you,

His very air, that I should call you brother,

As I did him.

Have all his ventures failed ? What, not one hit ? Id.

The king hath laid, that in a dozen passes between you and him, he shall not exceed you three hits. Id.

There is a kind of conveying of effectual and imprinting passages amongst compliments, which is of singular use, if a man can hit upon it. Bacon.

The experiment of binding of thoughts would be diversified, and you are to note whether it hits for the most part. Id. Natural History.

Hail, divinest melancholy !

Whose saintly visage is too bright

To hit the sense of human sight. Milton. But thou bringest valour too and wit,

Two things that seldom fail to hit. Hudibras. But with more lucky hit than those

That use to make the stars depose. Id.

When I first saw her I was presently stricken; and I, like a foolish child, that when any thing hits him will strike himself again upon it, would needs look again, as though I would persuade mine eyes that they were deceived. Sidney.

Is he a god that ever flies the light?

Or naked he? disguised in all untruth?

If he be blind, how hitteth he so right? Id. Search every comment that your care can find,

Some here, some there, may hit the poet's mind.

Roscommon.

It is much, if men were from eternity, that they should not find out the way of writing sooner : sure he was a fortunate man, who, after men had been eternally so dull as not to find it out, had the luck at last to hit upon it. Tillotson.

What prince soever can hit off this great secret, need know no more either for his own safety, or that of the people he governs. Temple. of the people he governs.

You've hit upon the very string, which touched, Echoes the sound, and jars within my soul :

There lies my grief. Dryden's Spanish Fryar. So he the famed Cilician fencer praised,

And at each hit with wonder seemed amazed.

Dryden.

These hits of words a true poet often finds, without seeking. Id.

This may hit 'tis more than barely possible. Id.

There's a just medium betwixt eating two much and too little; and this dame had hit upon't, when the matter was so ordered that the hen brought her every day an egg. L'Estrange.

The fisherman's waiting, and the lucky hit it had in the conclusion, tell us, that honest endeavours will not fail. Id.

If bodies be extension alone, how can they move and hit one against another; or what can make distinct surfaces in an uniform extension? Locke.

Birds learning tunes, and their endeavours to hit the notes right, put it past doubt that they have perception, and retain ideas, and use them for patterns. Id.

His conscience shall hit him in the teeth, and tell him his sin and folly. South.

So hard it is to tremble, and not to err, and to hit the mark with a shaking hand.

If the rule we judge by be uncertain, it is odds but we shall judge wrong; and, if we should judge right, yet it is not properly skill, but chance; not a true judgment but a lucky hit. Id.

None of them hit upon the art.

If at first he minds his hits.

And drinks champaigne among the wits,

Five deep he toasts the towering lasses. Prior. Bones, teeth, and shells, being sustained in the water with metallic corpuscles, and the said corpuscles meeting with and hitting upon those bodies, become conjoined with them. Woodward.

If casual concourse did the world compose,

And things and hits fortuitous arose,

Then any thing might come from any thing; For how from chance can constant order spring ? Blackmore.

Here's an opportunity to shew how great a bungler my author is in hitting features. Atterbury.

To suppose a watch, by the blind hits of chance, to perform diversity of orderly motions ; without the regulation of art, this were the more pardonable absurdity. Granville.

There's but a true and a false prediction in any telling of fortune ; and a man that never hits on the right side, cannot be called a bad guesser, but muss miss out of design. Bentley.

All human race would fain be wits,

And millions miss for one that hits. Swift. HITCH, v. n. Sax. hiezan, or Fr. hocher .-Skinner. To catch; to move by jerks. I know not where it is used but in the following passage. -Johnson.

Whoe'er offends at some unlucky time

Slides in a verse, or hitches in a rhyme;

Sacred to ridicule his whole life long,

And the sad burthen of some merry song. Pove.

HITHE, n. s. Sax, hyde. A small haven to land wares out of vessels or boats: as Queenhithe, and Lambhithe, now Lambeth.

HITH'ER, adv. & adj. ~	Saxon, hiden, hy-
	Seppeano. The pri-
	> mary idea is approxi-
	mation, whether of
HITH'ERWARDS, adv.	time, place, or de-

sign; used in opposition to thither: hithermost, nearest on this side : Intherto, yet; at every time till the present: hitherwards, this way; this road ; towards the place nearest to the speaker.

Frende! what is thy name?

Art thou come hider to have fame ?

Have fame ! nay, forsothe, Frende ! quod 1,

I come not hither, grant mercy,

For no soche causè by my hed. Chaucer. Pandare answered : Be we comen hither

To fetchen fire and rennen home again.

295

Id.

Addison.

More ample spirit than hitherto was wont, Here needs me, while the famous ancestries Of my most dreadful sovereign I recount. Faerie Queene.

Cæsar, tempted with the fame Of this sweet island never conquered.

And envying the Britons blazed name,

O hideous hunger of dominion! hither came.

Spenser.

Id.

Hereupon dependeth whatsoever difference there is between the states of saints in glory; hither we refer whatsoever belongeth unto the highest perfection of man, by way of service towards God. Hooker.

In this we are not their adversaries, though they in the other hitherto have been ours. Id.

Some parcels of their power are forth already, Shakspeare. Coriolanus. And only hitherward.

The king himself in person hath set forth, Or hitherwards intended speedily. Shakspeare. A puissant and mighty power

Is marching hitherward in proud array. Id. Men must cndure

Their going hence, even as their coming hither. Id. Look now for no enchanting voice, nor fear The bait of honied words ; a rougher tongue

Draws hitherward. Milton.

Hitherto, lords, what your commands imposed I have performed, as reason was, obeying. Id.

Who brought me hither Will bring me hence, no other guide I seek. Id.

After these,

But on the hither side, a different sort,

From the high neighb'ring hills descended. Id. That which is external can be extended to a greater extent at the hithermost extreme. Hale.

An eternal duration may be shorter or longer upon the hither end, namely that extreme wherein it is Id. finite.

Hither belong all those texts, which require of us that we should not walk after the flesh, but after the Tillotson. spirit.

Hitherto I have only told the reader what ought not to be the subject of a picture or of a poem.

Dryden.

Hitherto she kept her love concealed, And with those graces every day beheld

The graceful youth.

He could not have failed to add the opposition of ill spirits to the good alone: this has hitherto been Id. Juvenal. the practice of the moderns.

To correct them, is a work that has hitherto been assumed by the least qualified hands. Swift.

Come hither, ye that press your beds of down And sleep not : see him sweating o'er his bread Before he cats it. Cowper's Task.

HIVE, n. s., v. a., & v. n. Sax. hype Un'VER. n. s. Goth. hiu. Sax. hype, from HI'VER, n. s. The habitation and receptacle for bees; the bees themselves; a company of persons : hive, to put in hives; to harbour; to contain; to take shelter or reside in companies. Hiver one who puts bees into hives.

But while that I beheld this sight,

I herde a noise approchen blive,

That fareth as bees doen in an hive

Agenst hir time of out flying.

Chaucer. The House of Fame. So bees with smoke, and doves with uoisome

stench.

Are from their hives and houses driven away. Shakspeare.

He sleeps hy day

More than the wild cat : drones hive not with me, Therefore I part with him. Id. The commons, like an angry hive of bees

That want their leader, scatter up and down. Id. What is a ship but a prison ? And so many cities are but as so many hives of bees.

Burton's Anatomy of Melancholy.

Ambitious now to take excise

Of a more fragrant paradise,

He at Fuscara's sleeve arrived,

Where all delicious sweets are hived.

Cleavelund. So wandering bees would perish in the air,

Did not a sound, proportioned to their ear, Appease their rage, invite them to the hive.

Waller.

Mr. Addison of Oxford has been troublesome to me : after his bees, my latter swarm is scarcely worth hiving. Dryden.

Let the hiver drink a cup of good beer, and wash his hands and face therewith. Mortimer.

When bees are fully settled, and the eluster at the Id. Husbandry. biggest, hive them.

Bees have each of them a hole in their hives ; their honey is their own, and every bee minds her own concerns. Addison.

In summer we wander in a paradisaical scene, among groves and gardens; but at this season we get into warmer houses, and hive together in cities.

Pope's Letters.

What modern masons call a lodge, was by antiquity called a hive of free masons; and therefore, when a dissention happens, the going off is to this day called swarming. Swift.

IIIVITES, an ancient people descended from Canaan, who dwelt at first in the country afterwards possessed by the Caphtorims, or Philistines, of Scripture. There were also Hivites in the centre of the promised land; for the Shechemites and the Gibeonites were Hivites. Gen. xxxiv. 2. Josh. xi, 19. There were also some beyond Jordan, at the foot of Mount Hermon. Bochart says, that Cadmus, who carried a colony of Phœnicians into Greece, was a Hivite. He derives Cadmus from the Hobrew Kedem, i. e. the east, because he was of the eastern part of Canaan; and Hermione, from Hermon. See HEVÆI.

Lat. eho. A call; a sudden 110, interj.) HoA. § exclamation to give notice of avproach, or any thing else.

What noise there, ho? Shakspeare. Here dwells my father Jew : hoa, who's within ?

Id. Stand, ho! speak the word along Id. When I cried hoa !

Like boys, kings would start forth, and cry,

Id.

Your will. Ho, swain, what shepherd owns that ragged sheep ? Druden.

HOADLEY (Benjamin), successively bishop of Bangor, Hereford, Salisbury, and Winchester, was born in 1676. His first preferment was the rectory of St. Peter le Poor, and the lectureship of St. Mildred's in the Poultry. In 1706 he published some Remarks on bishop Atterbury's Sermon at the funeral of Mr. Bennet. Two years after, Mr. Hoadley again entered the lists against this formidable antagonist; and in his Exceptions against a sermon published by Dr. Atterbury, entitled The Power of Charity to cover Sin, he attacked the doctor with his usual strength of reasoning. In 1709 another dispute arose be-

296

tween these two learned combatants, concerning the doctrine of non-resistance, occasioned by a performance of Mr. Hoadley's, entitled The Measures of Obedience ; some positions in which Dr. Atterbury endeavoured to confute, in his elegant Latin sermon, preached that year before the London clergy. In this debate Mr. Hoadley signalised himself in so eminent a degree, that the house of commons addressed the queen, to grant him some preferment as a reward for the signal services lie had rendered to the cause of civil and religious liberty. But the principles which he espoused were repugnant to the temper of those times; and the queen, though she promised to attend to their requests, never did so. A Mrs. Howland, however, presented him, unasked, to the rectory of Streatham in Surrey. Soon after the accession of king George I. he was consecrated bishop of Bangor: but in 1717, having broached some opinions concerning the nature of Christ's kingdom, &c., he again became the object of popular clamor; when he was distinguished by another mark of royal regard, by the convocation being successively prorogued, till that resentment had subsided. In 1721 he was translated to Hereford; in 1723 to Salisbury; and in 1734 to Winchester: when he published his Plain Account of the Sacrament; which also occasioned much controversy. As a writer, he possessed uncommon abilities. His Sermons (published in 1754 and 1755) are esteemed inferior to few writings in the English language, for plainness and perspicuity, energy, strength of reasoning, and a free and masterly style. In private life he was facetious, easy, and complying; fond of company, yet would frequently leave it for study or devotion. He died in 1761, aged eighty-three. Besides the above, he wrote, 1. Terms of Acceptance, 8vo. 2. Reasonableness of Conformity. 3. On the Sacrament. His tracts and pamphlets are extremely numerous; and the reader may see a catalogue of them in the Supplement to the Biog. Brit.

HOADLEY (Benjamin), M. D. and F.R.S., son of the bishop, was born in 1706; and studied at Benet College, Cambridge, under the tuition of Dr. afterwards Archbishop Herring. Applying himself to mathematics and philosophy, he was, when very young, admitted a member of the Royal Society. He was made register of Hereford, and was appointed physician to his majesty's household, but died at his house in Chelsea in 1757. He wrote, 1. Three Letters on the Organs of Respiration, 4to. 2. The Suspicious Husband, a comedy. 3. Observations on a Series of Electrical Experiments; and 4. Oratio Anniversaria, in Theatro Col. Med. Londin. ex Harvei Instituto, habita die 18º Octob. 1742.

HOAIN-GAN-FOO, or HWOOEE-GAN-FOO, a considerable city of China, in the province of Kiangnan, situated on the bank of the great canal. Its population crowded round the late British embassy under lord Amherst. There is a large dock yard in the vicinity; and the canal is above the level of the town. Long. 118° 47' E., lat. 53° 30' N.

HOANG-HO, or Yellow River, a remarkable river of China, and one of the most promi-

nent features in its geography. See CHINA. It derives its name from the yellow color given it by the clay and sand washed down in the time of rain. After a course of nearly 600 leagues, it discharges itself into the Eastern Sea not far from the mouth of the Kiang. Though broad and rapid, it is in many places too shallow for any important navigation: it is also liable to overflow its banks, so that it has been necessary in many places to raise dikes on the side of it for the defence of the country.

HOANG-TCHEOU, a city of China of the first rank, in the province of Hou-Quang, on the Yang-Tse, 585 miles south of Pekin.

HOAR, adj. HOAR'FROST, n.s. Aar. White; gray with HOAR'INESS, n. s. fage; white with frost: hoar-HOAR'Y, adj. frost is the congelations of dew on frosty mornings: hoary, mouldy; mossy or rusty.

When the dew was gone up, behold upon the face of the wilderness there lay a small round thing, as small as the hoar-frost on the ground.

Exod. xvi. 14.

Though I be hoor, I fare as doth a tre

That blosmeth er the fruit ywoxen be;

The blosmy tre is neither n'is neither drie ne ded I fele me no wher hoor but on my hed.

Chaucer. The Merchantes Tale. It governed was and guided evermore

Through wisdom of a matron grave and hour.

Spenser.

A comely palmer clad in black attire

Of ripest years and hairs all hoary grey. Id. There was brought out of the city into the camp very coarse, hoary, moulded bread.

Knolles's History.

Solyman, marvelling at the courage and majesty of the hoary old prince in his so great extremity, dismissed him and sent him again into the city. Id.

The seasons alter ; hoary headed frosts

Fall in the fresh lap of the crimson rose.

Shakspeare,

A people,

Whom Ireland sent from loughs and forests hour. Fairfax

Oft listening how the hounds and horn

Cheerly rouse the slumbering morn,

From the side of some hoar hill

Through the high wood echoing shrill.

Milton. L'Allegro.

He grows a wolf, his hoariness remains, And the same rage in other members range.

Dryden.

Has then my hoary head deserved no better ? Rowe.

Thus she rested on her arm reclined. The hoary willows waving with the wind.

Addison.

Then in full age and hoary holiness,

Retire, great preacher, to thy promised bliss. Prior. Cool breathes the morning air, and Spreads wide her hoary mantle o'er.

Gay's Rural Sports.

In Fahrenheit's thermometer, at thirty-two degrees, the water in the air begins to freeze, which is known by hour-frosts. Arbuthnot.

Now swarms the populace, a countless throng -Youth and hoar age, and man drives man along.

Pope.

Island of bliss, all assaults Baffling, like thy hoar cliffs, the loud sea wave.

Thomson.

---- and the wood,

The covert of old trees, with trunks all hoar, But light leaves, young as joy, stands where it stood,

Offering to him and his a populous solitude. Byron. Childe Harold.

HOAR-FROST, according to many Cartesians, is formed of a cloud, and either congealed in the cloud, and so let fall, or ready to be congealed as soon as it arrives at the earth. HOarfrost, M. Regis observes, consists of an assemblage of little parcels of ice crystals, which are of various figures, according to the different dispositions of the vapors when condensed by the cold.

HOARD, n. s., v. a. & v. n. Saxon hopö; HOARD'ER, n. s. Teutonic hord, a treasure. A store laid up in secret; a hidden stock; a treasure: to lay up in store; to store or preserve secretly: sometimes it is enforced by the particle up.

Ful riche was his tresour and his hord,

For which ful fast his counter dore he shet.

Chaucer. The Shipmannes Tale. He feared not once himself to be in need,

Nor cared to *hoard* for those whom he did breed. Spenser.

Happy always was it for that son, Whose father for his *hoarding* went to hell.

Shakspeare.

I have a venturous fairy, that shall seek The squirrel's *hoard*, and fetch thee thence new nuts.

The hoarded plague of the gods requite your love I

Beauty is nature's coin, must not be hoarded, But must be current, and the good thereof Consists in mutual and partaken bliss

Unsavoury in the enjoyment of itself.

Milton. Comus. The base wretch who hoards up all he can, Is praised, and called a careful thrifty man.

Dryden.

You hoard not health for your own private use, But on the publick spend the rich produce. Id.

I have just occasion to complain of them, who, because they understand Chaucer, would *hoard* him up as misers do their grandam gold, only to look on it themselves, and hinder others from making use of it. *Id.*

Since commodities will be raised, this alteration will be an advantage to nobody but hoarders of money. Locke.

They might have even starved, had it not been for this providential reserve, this *hoard*, that was stowed in the strata underneath, and now seasonably disclosed. *Woodward*.

A superfluous abundance tempts us to forget God, when it is *hourded* in our treasures, or considered as a cafe, independent provision laid up for many years. *Rogers*.

You will be unsuccessful, if you give out of a great man, who is remarkable for his frugality for the publick, that he squanders away the nation's money; but you may safely relate that he *hoards* it.

Arbuthnot's Art of Political Lying.

HOARE (William), was born in the year 1707, of respectable parents, at Eye in Suffolk, and received the advantages of education in a school at that time of high repute for classical instruction. If e discovered an early disposition for painting; and, after he left school, his father carried him to London, and placed him under

the tuition of Grisoni, an Italian painter. From the skill of Grisoni the scholar could derive little profit; but it is probable that from his conversation he imbibed that ardent desire of visiting the works of the Italian masters, which prompted him to set the example of a system afterwards pursued with so much avidity and success by most of our young students in painting. The name of William Hoare stands first on the list of those English painters who have resorted to Italy, with a view to professional improvement. Arriving at Rome, he placed himself in the school of Francisco Imperiali, and was the fellow pupil of Pompeio Battoni. During a residence of nine years in Italy he made numerous copies of the historical works of the great masters, and he returned to England filled with visionary hopes, and an ardent love of his profession, which did not desert him even at the latest period of an extended life. Finding himself a stranger in London, and without the means of rendering his talents known, he accepted an invitation from some of his friends who resided at Bath, in Somersetshire, and there found such constant employment in painting portraits, that he was induced to settle in that city. From the study of Rosalba's pictures, he added the practice of crayons to that of oil-painting, and carried it to a degree of excellence second only to the powers of that celebrated paintress. He maintained at Bath a very high character as a portrait painter. He gave to the altar of St. Michael's church, at Bath, a figure of our Saviour, as large as life ; and afterwards painted for the octagon chapel, in that city, an historical composition, represent-ing 'The Miracle at the Pool of Bethesda.' These exertions procured him commissions for a few historical pictures, the principal merit of which consists in the display of an elegant taste, and faithful study of nature. Residing at a distance from the metropolis, where the competition of younger artists was continually accelerating the advance of English art, he retained to the last the style which he had adopted in the Italian school. His most celebrated portrait in oil is a half-length of William Pitt, the first earl of Chatham. On the formation of the Royal Academy he was elected one of the original members, and was a constant exhibitor for many years. He died at Bath in 1792.

HOARHOUND, Lat. marrubium. A plant.

Hoarhound has its leaves and flower-cup covered very thick with a white hoarinces: it is famous for the relief it gives in moist asthmas, of which a thick and viscous matter is the cause; but it is now little used. Hill.

HOARHOUND. See MARRUBIUM.

HOARHOUND, WHITE. See BALLOTA. HOARSE, adj. HOARSE', adj. HOARSE'LY, adv. HOARSE'NESS, n.s. Belg. haarsch. Having HOARSE'NESS, n.s. the voice rough, as with a cold; having a rough sound.

Me thought, I herde an hunter blowe

T' assay his gret horne, and to knowe

Whethre it were clere or horse of sowne.

Chaucer. Boke of the Duchesse. Come, sit, sit, and a song.

-Clap into't roundly, without hawking or spitting, or saying we are hoarse. Shakspeare. The raven himself is hoarse, That croaks the fatal entrance of Duncan Under my battlements. Id. Macbeth.

I oft have heard him say, how he admired Men of your large profession that could speak To every cause, and things mere contraries Till they were *hoarse* again, yet all be law.

Ben Jonson.

299

The voice is sometimes intercluded by an hoarseness, or viscous phlegm. Holder.

I had a voice in heaven, ere sulph'rous steams Had damped it to a hourseness.

Dryden. King Arthur.

The hounds at nearer distance hoursely bayed; The hunter close pursued the visionary maid.

Dryden.

The want of it in the wind-pipe occasions hoarseness in the gullet, and difficulty of swallowing.

Arbuthnot on Aliments.

HOARSENESS is a diminution or temporary loss of the voice, sometimes attended with a preternatural asperity or roughness of utterance. The parts affected are the trachea and larynx. It is occasioned by a slight inflammation of the mucous membrane covering those parts; and is relieved by mucilaginous linetuses; warm diluting drinks, such as bran-tea, linseed-tea, &c.; assisted by opiates and sudorific medicines taken at bed-time.

HOBBES (Thomas), born at Malmsbury in 1588, was the son of a clergyman. He completed his studies at Oxford, and being afterwards patronized by the Devonshire family, attended one of the sons in his travels through France and Italy, during which he translated Thucydides. In 1626 his patron the earl of Devonshire died; and in 1628 his son died also. In 1631 the countess dowager of Devonshire desired to put the young earl under his care, who was then about the age of thirteen. In 1634 he re-published his translation of Thucydides, which he had previously given to the world in 1628. The same year he accompanied his noble pupil to Paris, where he applied his vacant hours to the study of natural philosophy. From Paris he attended his pupil into Italy, where at Pisa he became known to Galileo, soon after which he returned with the earl of Devoushire into England. Afterwards, foreseeing the civil wars, he went to seek a retreat at Paris; where he became intimate with the famous Des Cartes, with whom he afterwards kept up a correspondence upon several mathematical subjects, as appears from his letters published in Des Cartes's works. In 1642 Mr. Hobbes first printed a few copies of his book De Cive, which, in proportion as it became known, raised him many adversaries, who charged him with instilling principles of a dangerous tendency. While in France Sir Charles Cavendish, brother to the duke of Newcastle, proved a constant friend and patron to Mr. Hobbes; who, by engaging, in 1645, in a controversy about squaring the circle, became so famous, that in 1647 he was recommended to instruct Charles II. in mathematics. In 1647 was printed in Holland, by M. Sorbiere, a more complete edition of his De Cive; to which are prefixed two Latin letters to the editors by Gassendi, and F. Mersenne, in

commendation of it: and in 1650 was published at London a small treatise of Mr. Hobbes's, entitled Human Nature; and another, De Corpore Politico. All this time he had been digesting his religious, political, and moral principles, into a complete system, called the Leviathan, which was printed at London in 1650 and 1651. In 1660, upon the Restoration, he came up to London, where he obtained from the king an annual pension of £100. But in 1666 his Leviathan, and his treatise De Cive, were censured by Parliament; which alarmed him very much, as did also a bill brought into the house of commons to punish atheism and profaneness. In 1669 he was visited by Cosmo de Medicis, afterwards duke of Tuscany, who gave him ample marks of his esteem; and having received his picture, and a complete collection of his writings, caused them to be deposited among his curiosities, in the library at Florence. He was also visited by foreign ambassadors and other strangers, who were curious to see a person whose opinions had been so widely celebrated. In 1672 he wrote his own Life in Latin verse, when he had completed his eighty-fourth year; and in 1674 he published a poetical English version of the four books of Homer's Odyssey; which were so well received, that he translated the whole Iliad and Odyssey, which he likewise published in 1675. About this time he went to spend the remainder of his days in Derbyshire : where, notwithstanding his advanced age, he published several pieces, to be found in his works. He died in 1679, aged ninety-two. In his last sickness his frequent questions were, whether his disease was curable ? and when intimations were given that he might have ease, but no remedy, he said, ' I shall be glad to find a hole to creep out of the world at; ' which are reported to have been his last sensible words. Hobbes's style is incomparably better than that of any other writer in the reign of Charles I. 'He has in translation,' says Granger, 'done Thucydides as much justice as he has done injury to Homer. But he was for striking out new paths in science, government, and religion; and for removing the land-marks of former ages. His ethics have a strong tendency to corrupt our morals, and his politics to destroy that liberty which is the birth-right of every human creature. He is commonly represented as a sceptic in religion, and dogmatist in philosophy; but he was a dogmatist in both. The main principles of his Leviathan are as little founded on moral or evangelical truths, as the rules he has laid down for squaring the circle are in mathematical demonstration. His book on human nature is esteemed the best of his works.'

HOBBIMA (Minderhout), an eminent landscape painter, born about 1611 at Antwerp. He studied entirely after nature, and his choice was exceedingly picturesque. He was particularly fond of describing slopes diversified with shrubs, plants, or trees, which conduct the eye to some building, ruin, grove, or piece of water, and frequently to a delicate remote distance. The figures which he designed are but indifferent. Conscious of his inability in that respect, he admitted but few figures into his designs, and usually placed them somewhat removed from the immediate view at a prudent distance from the front line. However, most of his pictures were supplied with figures by Ostade, Teniers, and other famous masters, which gave them a great additional value. They are very scarce.

HOB'BLINGLY, adv.

HOB'BLE, v. n. & n. s. Gothic noppo, horse; Fr. hobin, a pacing horse. Jirish or Scottish An

HOB'BY, n.s.horse; a paeing horse; a garran: to walk lamely or awkwardly upon one leg more than the other; to hitch; to walk with unequal and encumbered steps ; to move roughly or unevenly : hence an uneven awkward gait. Feet being ascribed to verses, whatever is done with feet is likewise ascribed to them. Hobblingly in its literal and figurative acceptation is clumsily, aukwardly, with halting gait : hobby the name of a small pony; a stick on which boys get astride to ride; a stupid fellow.

I have studied eight or nine wise words to speak to you, which these hobby horses must not hear. Shakspeare.

For twenty hobblers armed, Irishmen so called, because they served on hobbies, he paid sixpence a-piece per diem. Davies.

Those grave contenders about opinionative trifles look like aged Socrates upon his boy's hobby horse.

Glanville. The friar was hobbling the same way too.

Dryden.

Prior.

Those ancient Romans had a sort of extempore poetry, or untuneable hobbling verse. Id.

As young children who are tryed in Go-carts, to keep their steps from sliding, When members knit, and legs grow stronger,

Make use of such machine no longer ;

But leap pro libitu, and scout

On horse called hobby, or without.

While you Pindarick truths rehearse, She hobbles in alternate verse.

Id. Some persons continued a kind of hobbling march on the broken arches, but fell through. Addison.

No hobby horse with gorgeous top.

Could with this Rod of Sid compare. Swift. Was he ever able to walk without leading-strings, without being discovered by his hobbling ? Id.

HO'BBY, n. s. Fr. hobereau. A species of hawk.

They have such a hovering possession of the Valtoline, as an hobby hath over a lark. Bacon.

The people will chop like trouts at an artificial fly, and dare like larks under the awe of a painted hobby.

L'Estrange.

Larks lie dared to shun the hobby's flight.

Dryden.

HOBGOB'LIN, n. s. According to Skinner, for robgoblins from Robin Goodfellow, Hob being the nickname of Robin : but more probably according to Wallis and Junius, hopgoblins empusæ, because they do not move their feet: whence, says Wallis, came the boys' play of fox in the hole, the fox always hopping on one leg. A frightful fairy.

Fairies, black, grey, green, and white, Attend your office and your quality : Crier hobgoblin, make the fairy o-yes.

Shakspeare.

HOBLERS, or HOBILERS, hobelarii, in ancient English customs, were men who, by their tenure, were obliged to maintain a light horse or hobby, for the certifying any invasion towards the sea-side. The name was also used for certain Irish knights, who used to serve as lighthorsemen upon hobbies.

HOB'NAIL, n. s. From hobby and nail. HOB'NAILED, adj. A nail used in shoeing a hobby or little horse; a nail with a thick strong head.

Steel, if thou turn thine edge, I beseech Jove on my knees thou mayest be turned into hobnails.

Shakspeare.

We shall buy maidens as they buy hobnails, by the hundred. Id.

Wouldest thou, friend, who hast two legs alone, Wouldest thou, to run the gauntlet, these expose

To a whole company of hobnailed shoes? Dryden.

HOB'NOB. This is probably corrupted from hab nab by a coarse pronunciation. See HAB NAB.

His incensement at this moment is so implacable, that satisfaction can be none, but pangs of death and sepulchre : hobnob is his word ; give't or take't.

Shakspeare.

HOCHE (Lazarus), a celebrated general in the service of the French republic, was born on the 24th of June, 1768, in the suburbs of Versailles. His father was the keeper to Louis XV's dog-kennel. Such an origin precluded him from the advantages of a liberal education. By the kindness of his aunt, who was a green grocer at Versailles, he was taught to read and write, and finally engaged as a stable-boy at Versailles. But an accidental glance at a work of Rousseau's determined him to travel. For this purpose he enlisted for the East Indies, but was removed into the French guards. He was only sixteen when he was ordered to join his regiment at Paris. Anxious to make up for the deficiency of his education, he employed all his leisure hours, and even part of those usually spent in sleep, in embroidering caps, the profits of which labor he devoted chiefly to the purchase of books. These he read with avidity, and soon made himself master of the theory of military tactics. His merit now attracted notice, and he was raised to the rank of corporal in 1788. The French guards were the chief cause of turning the scale against the court in favor of the people, on the 14th of July, 1789, at the attack on the Bastile; and Hoche was one of the first in leading on the assault. When La Fayette new-modelled the corps, Hoche was promoted; and soon after, Servan, then minister of war, sent him a lieutenant's commission in the regiment of Rouergue; which he joined, June 24th, 1792, in the garrison at Thionville, where he first distinguished himself in action. After this, being drafted into the army of the Ardennes, he performed the most essential services under general Leveneur; particularly at that critical period when the treachery of Dumourier and Miranda had endangered the destruction of the army of the North. But it would swell this article beyond all due bounds were we to follow our hero through all the scenes in which he was engaged, from the time that he was ap-

pointed general in chief; or attempt to delineate his brilliant actions at Wert, Weissembourg, Freischweiller, Germersheim, Worms, Spire, Fort Vauban, &c. It was in the midst of this career of victory that the envy of his enemies procured him to be apprehended and lodged in the conciergerie at Paris, from which he was not liberated till the memorable 9th of Thermidor, 1795. Upon his liberation he was sent to subdue the insurgents of La Vendée; and his well arranged plans were the chief cause of the failure of our unfortunate expedition to Quiberon. Hoche's zeal for his country led him to think, that an invasion of England or Ireland was not only practicable, but that it would be crowned with success. The latter measure was at last attempted, and its failure is well known. Our hero's feelings may be easier conceived than described. His narrow escape in the Fraternité, through the midst of the British fleet, hardly lessened the disappointment. Being, however, afterwards appointed to the command of the army of the Sambre and Meuse, he led his troops to new victories; and Montabour, Dierdorff, Altenkirchen, &c., witnessed their valor .- But the career of this great general was now drawing near a close. The excessive fatigues he had undergone had impaired his constitution, and brought on a gradual decay, attended with an incessant cough and difficulty of breathing; while the unsettled state of affairs at Paris added to his distress of body, by increasing his anxiety of mind. He died September 17th, at Wetzlar, in the thirtieth year of his age, not without suspicion of poison. His last words were, 'Farewel my friends! Desire the Directory to take care of Belgium.' He was interred with great pomp at Coblentz.

HOCHSTETTER (Andrew Adam), a protestant divine, born at Tubingen in 1698. He was professor of divinity in that university, and afterwards rector. II is chief works are, 1. Collegium Puffendorsianum; 2. De Festo Expiationis et hirco Azahel; 3. De Conradino, ultimo ex Suevis duce; 4. De Rebus Albigensibus. He died in 1717.

HOCHHEIM, a small town in the duchy of Nassau, four miles from the Rhine, celebrated for the wine termed Hock. It stands on a small eminence occupied by vineyards finely exposed to the sun, and the best wine of the place is produced on a little elevation of eight acres, sheltered from the north; the average produce is twelve large casks of wine, which are said to fetch, as soon as made, from £120 to £150 sterling. The town is twenty miles west of Frankfort, and four north-east of Mentz.

HOCHSTADT, a town of Bavaria, at the influx of the river Egwied into the Danube. It is remarkable as the scene of many bloody conflicts. 1. The imperialists were defeated near it by the elector of Bavaria in 1703. 2. In 1704 (13th of August) the French and Bavarians sustained a most signal defeat in this neighboorhood from the duke of Marlborough and prince Eugene. 3. In 1800 the French, under Moreau, obtained a considerable victory here over the Austrians. Population 2300. Nineteen miles north-west of Augsburg, and twenty-nine west of Neuburg.

HOCK, n. s. & v. a.) 1. The same with hough , Saxon boh. The joint HOCK'LE, v. a. between the knee and the fetlock. Hock and hockle to disable in the hock.

HOCK, n. s. From Hockheim on the HOCKAMORE. Maine. Old strong Rhenish. Restored the fainting high and mighty,

With brandy, wine, and aqua vitæ;

And made 'em stoutly overcome

301

With bachrach, hochamore and mum.

Hudibras. Wine becomes sharp, as hock, like vitriolick acidity. Floyer.

If cyder-royal should become unpleasant, and as unfit to bottle as old hockamore, mix one hogshead of that and one of tart new cyder together.

Mortimer.

Ring for your valet, bid him quickly bring Some hock and soda-water; then you'll know

A pleasure worthy Xerxes the great king ; For not the blest sherbet, sublimed with snow,

Not the first sparkle of the desert spring, Nor Burgundy in all its sunset glow,

After long travel, ennui, love, or slaughter, Vie with draughts of hock and soda water.

Don Juan

HOCK'HERB, n. s. Hock and herb. A plant; the same with mallows.

HOCKHOCKING, a river in the state of Ohio, United States; it has its rise near a branch of the Scioto, and, running south-west, falls into the Ohio at Tray, in N. lat. 38° 57', after a course of about eighty miles. It is navigable to Athens, forty miles from its mouth, for large keel boats ; about six miles above this are rapids, which prevent any further ascent.

HOCUS Pocus. Swed. hokus pokus. The original of this word is referred by Tillotson to a formula of transubstantiation in the Romish church, in which they say hoc est corpus, this is the body (of the Lord). Junius derives it from Welsh *hocced*, a cheat, and poke and pocus a bag, jugglers using a bag for conveyance. It is corrupted from some words that had once a meaning, and which, perhaps, cannot be discovered. A juggle; a cheat.

This gift of hocus pocussing and of disguising mat-L'Estrange. ters is surprising.

HOD, n. s. Corrupted perhaps in con-

HOD, *n. s.* HOD'MAN, *n. s.* Corrupted perhaps in con-tempt from hood, a hod being HOD'MANDOD. carried on the head; perhaps from Teut. herrd, or hotte, a wicker basket; a kind of trough in which a laborer carries mortar to the masons: hodman a laborer that carries mortar: hodmandod a fish.

Those that east their shell are the lobster, the erab, the crawfish, and the hodmandod or dodman.

Bacon.

A fork and a hook to be tampering in clay

A lath, hammer, trowel, a hod or a tray. Tusser. HODGE-PODGE, n. s. French hache poche> hochepot quasi hachis en pot. A medley of in-

gredients boiled together. Ye han not knowe the wille of your true frendes olde and wise, but ye han caste alle hir wordes in an hoche-pot, and enclined your herte to the more part and to the greter nombre, and ther be ye conde-scended. Chaucer. The Tale of Melibeus.

They have made our English tongue a gallimaufrey, Spenser. or hodge-podge of all other speeches.

It produces excellent corn, whereof the Turks make their trachana and bouhourt, a certain hodge-podge of sundry ingredients. Sandy's Travels.

302

HODGES (Nathaniel), M.D., a learned English physician, son of the Rev. Dr. Thomas Hodges, dean of Hereford. He was educated in Westminster, and graduated at Oxford in 1659. He settled in London; practised with great success during the plague in 1665, and was made fellow of the college of physicians in 1672; but was afterwards confined in Ludgate jail for debt, where he died in 1684. He wrote, 1. Vindiciæ Medicinæ et Medicorum, 1660, 8vo. 2. Λοιμολογια, 1672, 8vo. This work was translated into English by Dr. Quiney, and printed at London in 8vo., 1720. It gives an historical account of the rise, progress, symptoms, and cure of the plague.

HODIER'NAL, adj. Lat. hodiernus. Of today.

HODY (Humphry), a learned English divine, born in 1659. At twenty-one years of age he published his celebrated Dissertation against Aristeas's history of the seventy interpreters; which was received with great applause. He treated the subject more fully twenty years after, in his De Bibliorum Textibus Originalibus, Versionibus Græcis, et Latina vulgata, libri IV. In 1689 he wrote the Prolegomena to John Melala's Chronicle, printed at Oxford; and in 1690 was made chaplain to bishop Stillingfleet. The deprivation of the nonjuring bishops engaged him in a controversy with Mr. Dodwell; which recommended him to archbishop Tillotson, to whom, as well as his successor, Dr. Tennison, he was for some time chaplain. In 1698 he was made regius professor of Greek at Oxford, and archdeacon in 1704. On the controversy about the convocation, he, in 1701, published a history of English Councils and Convocations, and of the clergy's sitting in parliament, &c. He died in 1706, leaving in MS. an account of those learned Greeks who retired to Italy on the taking of Constantinople, &c., which was published in 1742 by Dr. Jebb.

HOE, n.s. & v.a. Goth. hog; Teut. howe; Fr. houe; Dut. howee. An instrument to cut up the earth, of which the blade is at right angles with the handle: to cut or dig with a hoe.

They must be continually kept with weeding and hoeing. Mortimer.

They should be thinned with a hoe. Id.

A HOE is somewhat like a cooper's adze, to cut up weeds in gardens, fields, &c. This instrument is of great use in hacking and clearing the corners and patches of land.

HOEING, in the new husbandry, is the breaking or dividing the soil by tillage while the corn or other plants are growing thereon. It differs from common tillage (which is always performed before the corn or plants are sown or planted) in the time of performing it; and it is much more beneficial to the crops than any other tillage.

HOESCHELIUS (David), a learned German, born at Augsburg, in 1556. He was made principal of the college of St. Anne; and, being also librarian, he enriched the library with a great number of Greek books and MSS. He published editions of Origen, Basil, Philo Judæus, Gregory of Nyssa, Gregory of Nazian-

ment, is esteemed a masterpiece. He died at

Augsburg in 1617, much regretted. HOF, HOFF, or STADT ZUM HOF, an old town of Franconia, on the river Saale, belonging to Bavaria. It was founded in the eleventh century, and admitted to the privileges of a free imperial town. The manufactures are woollens, cotton, and leather : here are also extensive breweries ; and in the neighbourhood fine quarries of marble. In 1759 prince Henry of Prussia defeated in this place a party of Austrians, under count Palfi. Population 5000. Twenty-two miles N.N.E. of Bayreuth, and forty-six north-east of Bamberg.

HOFER (Andrew), a Tyrolese chieftain, born at Passeyer in 1765, and who kept an inn in that town. The Tyrol being transferred to Bavaria by the treaty of Presburg, when the war with Austria was in 1809 renewed, the inhabitants rose in a mass to drive out the Bavarians, and place themselves under the Austrian dominion. Hofer was now elected their chief, and obtained some advantages over the enemy; but, the peace of Vienna having confirmed the cession of his country to Bavaria, he laid down his arms. He was however accused of having endeavoured to excite disaffection to the new government, and a price was set on his head. After a long search he was found hidden in a cabin on the summit of a lofty peak, surrounded by snow and gla-ciers. January 27th, 1810, his hut being surrounded by a body of grenadiers, he surrendered ; and was conducted to Botzen, and afterwards to Mantua, where he was condemned by a council of war to be shot. The sentence was almost immediately executed. After his death he was revered by his countrymen as a martyr; and the emperor of Austria has ennobled his son.

HOFFMAN (Daniel), a German divine, born in 1539. He was professor of the university of Helmstadt from 1598, and maintained that philosophy was a mortal enemy to religion; and that what was true in philosophy was false intheology. ,These absurd tenets occasioned a warm and extensive controversy. At length Hoffman was compelled by Julius, duke of Brunswick, to retract his invectives against philosophy, and to acknowledge, in the most open manner, the harmony and union of sound philosophy with true and genuine theology. He died in 1611, aged seventy-two.

HOFFMAN (Frederic), M. D., an eminent physician, born at Hall near Magdeburg in 1660. He took his degree in 1681; was made professor of physic at Hall in 1693; and filled the chair till his death, in 1742. His works were collected at Geneva in six large volumes, folio, 1748 and 1754. When travelling through Holland he became acquainted with Paul Hermann, and not long after with the celebrated Boyle, whom he cured of a dangerous disease. He also attended the emperor Charles VI., and his empress, as well as Frederic of Prussia. He was whom he had five children. He published a the first who composed Seidlitz powders. He died in his eighty-second year.

HOFFMAN (John James), professor of Greek at Basle, was born at Basle in 1635. He published at Geneva, in 1677, a learned work entitled Lexicon Universale Historico-Geographico-Poetico-Philosophico-Politico-Philologicum; in 2 vols. folio. He afterwards enlarged it with a supplement; and died at Basle, in 1706, aged seventy-one.

HOFFMAN (Maurice), M. D., was born of a good family, at Furstenwalde, in Brandenbourg, September 20th, 1621; and was driven early from his native country by war and pestilence. In 1637 he was sent to study in the college of Colun. Famine and the plague drove him thence to Kopnik, where he buried his father; and in 1638 he went to Altorf, to his maternal uncle, who was a professor of physic. Here he finished his studies in classical learning and philosophy, and then applied with the utmost ardor to physic. In 1641 he went to the university of Padua; where anatomy and botany were the great objects of his pursuit; and he became deeply skilled in both. After three years he returned to Altorf, to assist his uncle, now growing infirm, in his business; and, taking the degree of M. D., applied himself to practice, in which he had great success. In 1648 he was made professor extraordinary in anatomy and surgery; in 1649 professor of physic, and soon after member of the college of physicians; in 1633 professor of botany, and director of the physic-garden. He acquitted himself excellently in these various employments; and, in his profession, his reputation was so high and extensive, that many princes of Germany appointed him their physician. He died of an apoplexy in 1698, aged seventy-six, after having published a great number of works.

HOFFMAN (John Maurice), son of the preceding, by his first wife, was born at Altorf in 1653; and sent to a school at Herszprugk, where, having acquired a competent knowledge of the Greek and Latin, he returned to his father at Altorf at sixteen, and studied philosophy and physic. He went afterwards to Frankfort on the Oder, and next to Padua, where he studied two years. Then, making a tour of part of Italy, he returned to Altorf in 1674, and was admitted M. D. In 1677 he was made professor extraordinary in physic, and in 1681 professor in ordinary. George Frederic, marquis of Anspach, chose him for his physician; and Hoffman attended him into Italy, and renewed his acequaintance with the literati of that country. Upon the death of his father, in 1698, he succeeded him in his places of botanic professor and director of the physic-garden. He was elected also rector of the university of Altorf; a post which he had occupied in 1686. He lost his great friend and patron, the marquis of Ans-pach, in 1703: but found the same kindness from his successor William Frederic, who pressed him so earnestly to reside near him, and made him such advantageous offers, that, in 1713, he removed from Altorf to Anspach, where he died in 1727. He had married a wife in 1681, by

great number of works, which are highly esteemed.

HOG, n.s. HOG'COTE, n.s. HOG'GEREL, n. s. HOG'HERD, n.s. Hog'gisn, adj. Hog'GISHLY, adv. HOGS'HEAD, n. s. Hog'sty, n. s.

303

Welsh huch, from Goth. hoggwa; Swed. hugga, to cut, says Mr. Thomson; the general name of swine; a castrated boar: 'to bring hogs to a fine market,' to fail of one's design: hogcote, hogsty a house for hogs;

Hoc'wASH, n. s.) hoggerel a two year old ewe: hogherd a keeper of hogs: hoggish and hoggishly, brutish; greedy; selfish: hogshead, a measure of liquids containing sixty-three gallons; any large barrel: hogwash the draff which is given to swine.

Ran cow and calf; and eke the veray hogges So fered were, for berking of the dogges,

And shouting of the men and women eke.

They ronnen so, hem thought hir hertes breke.

Chaucer. The Nonnes Preestes Tale. This will raise the price of hogs, if we grow all to be

pork-eaters. Shakspeare. Blow strongly with a pair of bellows into a hoyshead,

putting into it before that which you would have preserved ; and in the instant that you withdraw the bellows, stop the hole. Bacon.

Only a target light, upon his arm

He careless bore, on which old Gryll was drawn,

Transformed into a hog with cunning charm.

Fletcher's Purple Island. Suspicion Miso had, for the hoggish shrewdness of her brain, and Mopsa, for a very unlikely envy.

Sidney. Out of a small hoycotc sixty or eighty load of dung hath been raised. Mortimer.

You have brought your hogs to a fine market. Spectator.

Varro tells, that every jugerum of vines yielded six hundred urns of wine : according to this proportion, our acre should yield fifty-five hogsheads and a little more. Arbuthnot.

Your butler purloins your liquor, and the brewer sells you hogwash. Id. History of John Bull.

The hog that plows not, nor obeys thy call,

Lives on the labours of this Lord of all. Popc. The families of farmers live in filth and nastiness, without a shoe or stocking to their feet, or a house so convenient as an English hogsty. Swift.

They slung up one of their largest hogsheads; I drank it off; for it did not hold half a pint.

Id. Gulliver's Travels.

The terms hogherd and cow-keeper are not to be used in our poetry; but there are no finer words in the Greck. Broome.

Hoc, in zoology. See Sus.

Hog, on board of a ship, is a sort of flat scrubbing broom, formed by enclosing a number of short twigs of hirch, or such wood, between two pieces of plank fastened together, on cutting off the ends of the twigs. It is used to scrape the filth from the ship's bottom under water, particularly in the act of boot-topping. For this purpose they fit to this broom a long staff with two ropes; one of which is used to thrust the hog under the ship's bottom, and the other to guide and pull it up again close to the planks. This business is commonly performed in the ship's boat, which is confined as close as possible to the vessel's side during the operation, and is shifted from one part of the side to another till

the whole is completed. Since vessels however have been more universally copper-bottomed this has been laid aside.

HOGARTH (William), the celebrated painter, was born in 1697, or 1698, in the parish of St. Martin, Ludgate. 'He was bound,' says Mr. Walpole, 'to a mean engraver of arms on plate; but, before his time was expired, he felt the impulse of genius, and that it directed him to painting.' During his apprenticeship he set out one Sunday, with two or three companions, on an excursion to Highgate. The weather being hot they went into a public-house, where they had not been long before a quarrel arose between some persons in the same room. One of the disputants struck the other on the head with a quart pot and cut him very much. The blood running down the man's face, together with his agony from the wound, which had distorted his features into a most hideous grin, presented Hogarth with too laughable a subject to be overlooked. He drew out his pencil, and produced on the spot one of his most ludicrous figures. What made this piece the more valuable was, that it exhibited an exact likeness of the man, with a portrait of his antagonist, and the figures in caricature of the principal persons gathered round. The first piece in which he distinguished himself as a painter is supposed to have been a representation of Wanstead Assembly. The figures in it were drawn from the life, and without burlesque. The faces were said to be extremely like, and the coloring rather better than in some of his more highly finished performances. From the date of the earliest plate that can be ascertained to be his work it is supposed that he began business for himself about 1720. Engraving of arms and shop bills was his first employment. The next was to design and furnish plates for booksellers. There are many family pictures by Hogarth, in the style of serious conversation pieces, still existing. In the early part of his life a nobleman (lord O----) came to sit for his picture. It was executed with a skill that did honor to the artist's abilities; but the likeness was rigidly observed, without even the necessary attention to compliment. The peer, disgusted at this counterpart of himself, was not fond of paying for a reflector that would only exhibit his deformities. Some time was suffered to elapse before the artist applied for his money; but, after many applications made without success, he sent him the following card :-- Mr. Hogarth's dutiful respects to lord O----: finding that he does not mean to have the picture which was drawn for him, is informed again of Mr. H's necessity for the money : if, therefore, his lordship does not send for it in three days, it will be disposed of, with the addition of a tail and some other little appendages, to Mr. Hare, the famous wild beast man; Mr. H. having given that gentleman a conditional promise of it, for an exhibition picture, on his lordship's refusal.' This intimation had the desired effect. The picture was paid for and committed to the flames. Mr. Nichols assures us, from unquestionable authority, that almost all the personages who attend the levee of the Rake were undoubted portraits; and that in Southwark Fair, and Modern Midnight

Conversation, as many more were discoverable. The duke of Leeds has an original scene in The Beggar's Opera, painted by Hogarth. It is that in which Lucy and Polly are on their knees, before their respective fathers, to intercede for the life of Macheath. All the figures are either known or supposed to be portraits. Mr. Walpole has a picture of a scene in the same piecc, where Macheath is going to execution. In this also the likenesses of Walker and Miss Fenton, afterwards duchess of Bolton (the first Macheath and Polly), are preserved. In 1726, when the affair of Mary Tofts, the rabbit-breeder of Godalming, engaged the public attention, a few of our principal surgeons subscribed their guinea a-piece to Hogarth, for an engraving from a ludicrous sketch he had made on that subject. This plate contains, amongst other portraits, that of M. St. André, then anatomist to the royal household, and in high credit as a surgeon.

In 1730 Mr. Hogarth married the only daughter of Sir James Thornhill. The union was a stolen one, and consequently without the approbation of Sir James, who, considering the youth of his daughter, then barely eighteen, and the slender finances of her husband, as yet an obscure artist, was not easily reconciled to the match. Soon after this period, however, he began his Harlot's Progress (the coffin in the last plate is inscribed Sept. 2d, 1731); and was advised by lady Thornhill to have some of the scenes in it placed in the way of his father-inlaw. Accordingly, one morning, Mrs. Hogarth conveyed several of them into his dining-room. When he arose he enquired whence they came ; and, being told, he said, ' Very well; the man who can furnish representations like these can also maintain a wife without a portion.' He soon after, however, became reconciled and generous to the young couple. In 1732 Hogarth ven-tured to attack Mr. Pope, in a plate called The Man of Taste; containing a view of the gate of Burlington House, with Pope whitewashing it and bespattering the duke of Chandos's coach. This plate was intended as a satire on Pope, Mr. Kent the architect, and the earl of Burlington. In 1733 the third scene of his Harlot's Progress introduced him to the notice of the great. One of his excellencies consisted in what may be termed the furniture of his pieces. 'The Rake's levee room,' says Mr. Walpole, 'the nobleman's dining-room, the apartments of the husband and wife in Marriage à la Mode, the alderman's parlour, the bed-chamber, and many others, are the history of the manners of the age.' In 1745 Hogarth sold about twenty of his capital pictures by auction; and in the same year acquired additional reputation by the six prints of Marriage à la Mode, which may be regarded as the groundwork of a novel called the Marriage Act, by Dr. Shebbeare, and of the Clandestine Marriage. Soon after the peace of Aix-la-Chapelle he went over to France, and was taken into custody at Calais, while he was drawing the gate of that town; a circumstance which he has recorded in his picture entitled O the Roast Beef of Old England ! published March 26th 1749. He was actually carried before the governor as a spy, and after a very strict examination committed a pri-

soner to Granfire, his landlord on his promising that Hogarth should not go out of this house till he was to embark for England. In 1753 he appeared in the character of an author, and published a 4to. volume entitled the Analysis of Beauty, written with a view of fixing the fluctu-ating ideas of taste. This work was translated into German by Mr. Mylius when in England, under the author's inspection; and the translation was printed in London, price five dollars. A new and correct edition was in 1754 proposed for publication at Berlin, by Ch. Fr. Vok; with an explanation of Hogarth's satirical prints, translated from the French; and an Italian translation was published at Leghorn in 1761. Hogarth had one failing in common with most people who attain wealth and eminence without a liberal education : he affected to despise every kind of knowledge which he did not possess. Previously to his commencing author one of our artist's common topics of declamation was the uselessness of books to a man of his profession. But Garrick himself was not more open to flattery. A word in praise of Sigismundi, his favorite work, might have commanded a proof print, or an original sketch from Hogarth. A specimen of his propensity to merriment, on the most trivial occasions, is observable in one of his cards requesting the company of Dr. Arnold King to dine with him at the Mitre. Within a circle, to which a knife and fork are the supporters, the written part is contained. In the centre is drawn a pye, with a mitre on the top of it: and the invitation concludes with the following words in three Greek letters, H B II,-Eta, Beta, Pi. In the Miller's Feast Mr. Hogarth thought proper to pillory Sir Isaac Shard, a gentleman proverbially avaricious. Hearing this, the son of Sir Isaac, a young man of spirit, just returned from his travels, called at the painter's to see the picture; and, among the rest, asking the Cicerone 'Whether that odd figure was intended for any particular person?' on his replying that 'it was thought to be very like one Sir Isaac Shard' he immediately drew his sword and slashed the Hogarth appeared instantly in great canvas. wrath : to whom Mr. Shard calmly justified what he had done, saying ' that this was a very unwarrantable license; that he was the injured party s son, and that he was ready to defend any suit at law;' which, however, was never instituted. About 1757 his brother-in-law, Mr. Thornhill, resigned the place of king's serjeant-painter in favor of Mr. Hogarth.

Of his lesser plates many were destroyed. When he wanted a piece of copper he would take any plate from which he had already worked off such a number of impressions as he supposed he should sell. He then sent it to be effaced, and altered to his purpose. The plates which remained in his possession were secured to Mrs. Hogarth by will, dated August the 12th 1764, chargeable with an annuity of $\pounds 80$ to his sister Anne, who survived him.

HOGH, n. s. Dut. hoogh. A hill or rising ground.

That well can witness yet unto this day, The western hogh, besprinkled with the gore Of mighty Gœmot. Faerie Queene. Vol. X I HOGS'BEANS, n. s. Hogs'bread,

305

Hogs'mushrooms, Hogs'fennel. Plants.

Hog's Dung is by Mortimer reckoned one of the richest manures we are acquainted with; and the next in value to sheep's dung; and is found to be equal in virtue to twice the quantity of any other. It is an excellent manure for pasture grounds, and excels all other kinds of dung for trees. The farmers, who use it for their lands, generally take care to save it, by well paving the styes; and increase the quantity by throwing in bean-stalks, stubble, and many other things of a similar nature. By this management, many farmers have procured fifty or sixty loads a-year of excellent manure out of a small stye. The best way of using this dung is by mixing it with horse dung: and for this reason the stye should be near the stable, that the two cleansings may be mixed in one heap, and used together. They have, in many parts of Staffordshire, a poor light, shallow land, on which they sow a kind of white pea: the land is neither able to bear this nor any thing else to advantage for their reaping; but, when the peas are ripe, they turn in as many hogs as the quantity of peas will fatten, suffering them to live at large, and to remain there day and night : and thus the land produces a good crop of hay for several

enough to make good pasture. HOGSTIES, THE, a dangerous rocky reef among the Bahamas, situated between the Great Heneagua and Crooked Island. Ships sailing to Europe from Jamaica through the Crooked Island passage, clear them safely by steering from Ocean Bight, in the Great Heneagua, twelve leagues north-west, then north by west, half west about eleven leagues to Castle Island, the south point of South Crooked Island. Long. 73° 50' W., lat. 21° 40' N.

years afterwards; or, at worst, it raises grass

HOGUE, a fishing town and cape of France, on the north-west point of the department of the Channel, and late province of Normandy; near which admiral Rook burnt the French admiral's ship, called the Rising Sun, with twelve more large men of war, the day after the victory obtained by admiral Russel near Cherburg, in May 1692. Long. 1° 35' W., lat. 49° 50' N. The town contains about 2000 inhabitants and has a small fort.

HOHENBERG, a county of Suabia, in the Black Forest, now belonging to Wirtemberg. It consists of two parts, the Upper and the Lower; in the former is the source of the Neckar, and at no great distance that of the Danube. Both divisions are woody and hilly; the Lower, however, admits of tillage, and produces some wine. Iron abounds in both. The chief town is Rothenburg.

HOHENLINDEN, a village of Germany, in Bavaria, on the Danube: near which the French under general Moreau defeated the Austrians, on the 3rd of December, 1800, killed and wounded 12,000, and took 10,000 prisoners, among whom were three generals, together with eighty pieces of cannon and 200 loaded waggons, &c. At this place, too, the emperor Francis II signed

X

306

the convention in 1800, by which he gave up the forts of Ulm, Ingoldstadt, and Philipsburg, to the French.

HOHENLOHE, a district in the circle of Franconia, forming part of an extensive tract of country which has the Danube on the south, and the Maine on the north. The rivers of this country are the Jaxt, the Tauber, and the Kocher : the produce is corn, flax, and vines. Here are also extensive woods, and some few iron mines. The princes of Hohenlohe have now only their titles : the territory has belonged to Wirtemberg since 1806.

HOHENZOLLERN, a small principality of Germany, in the circle of Suabia, divided into two parts, Hohenzollern Hechingen, and Hohenzollern Sigmaringen. It is surrounded by Baden and Wirtemberg. The surface of the country is billy and woody: but there is some good pasturage in various parts. The chief town is Hechingen, a small place, situated on the Starzel, containing about 2600 inhabitants, with an unimportant manufacture of woollen cloth. It is the residence of the prince, and the seat of the courts and public offices of the principality. Population about 50,000.

HOIDEN, n. s. & v. n. Welsh hoeden; Lat. fæmina levioris famæ. An ill-taught awkward country girl: to romp indecently.

Some of them would get a scratch; but we always discovered, upon examining, that they had been hoidening with the young apprentices. Swift.

HOISE, v. a. Fr. hausser; Low German HOISE, hissen, from Goth. ha; Saxon heah, high. A variation from the same word as heave: the idea here is to raise on high, with effort; it is a transitive verb requiring an agent and an object; thus sailors hoist the long boat; whales when killed are hoisted into the vessel.

They loosed the rudder-bands and *hoisted* up the mainsail to the wind, and made toward the shore.

Acts xxvii. 40.

Auria had hoised sail, and was on his way toward the bay of Naupactus. Knolles's History.

'Tis the sport to have the engineer hoist up with his own petar. Shakspeare, Hamlet.

Join you with me;

We'll quickly hoist duke Humphrey from his seat. Shakspeare.

That man which prizeth virtue for itself, and cannot endure to *hoise* and strike his sails, as the divers natures of calms and storms require, must cut his sails of mean length and breadth, and content himself with a slow and sure navigation. Raleigh.

Hoise sail, and fly ;

And in thy flight aloud on Cratis cry. Chapman.

We thought for Greece

The sails were hoisted, and our fears release.

Dryden.

They hoist him on the bier, and deal the dole, And there's an end. Id. Persius. What haste she made to hoist her purple sails!

And to appear magnificent in flight,

Drew half our strength away. Id. All for Love. Their navy swarms upon the coasts : they cry

To hoist their anchors, but the gods deny. Dryden.

What made Absalom kick at all the kindnesses of his father, but because his ambition would needs be fingering the sceptre, and *hoisting* him icto his father's throne? South.

If 'twas an island where they found the shells, they straightways concluded that the whole island lay originally at the bottom of the sea, and that it was *hoisted* up by some vapour from beneath.

Woodward's Natural History.

Seize him, take, *hoist* him up, break off his hold, And toss him headlong from the temple's wall. Southern.

Some hoisted out the boats.

Byron. Don Juan.

HOISTING, the operation of drawing up any body by the assistance of one cr more tackles. Hoisting is never applied to the act of pulling up any body by the help of a single block, except in extending the sails by drawing them upwards along the masts or stays, to which it is invariably applied.

HOKE-DAY, HOCK-DAY, OF HOCK-TUESDAY, in ancient English customs (dies Martis quem quindenam paschæ vocant), the second Tucsday after Easter week; a solemn festival celebrated for many ages in England, in memory of the great slaughter of the Danes, in 1002. This is still kept up in some counties; and the women bear the principal sway in it, stopping all passengers with ropes and chains, and exacting some small matter from them to make merry with. This day was used on the same footing with Michaelmas for a general term or time of account. We find leases without date reserving so much rent payable ad duos anni terminos, scil. ad. le hoke-day, & ad festum sancti Michaelis. In the accounts of Magdalen College, Oxford, there is yearly an allowance pro mulieribus hockantibus of some manors of theirs in Hampshire; where the men hock the women on Mondays, and the women hock them on Tuesdays. The meaning of it is, that on that day the women in merriment stopped the way with ropes, and pulled passengers to them, desiring something to be laid out for pious uses.

HO-KIEN, or HO-KIEN-FOU, a city of China, in the province of Pe-tcheli, between two rivers, eighty-seven miles south of Pekin. It has two cities of the second, and fifteen of the third class, in its district. Long. 133° 29' E. of Ferro, lat. 38° 28' N.

HOLAIVA, or HOOLAIVA, one of the Hapaee Islands, in the South Pacific Ocean, thirty miles from Annanooka. It was uncultivated and uninhabited when visited by captain Cook, except by one man employed in catching turtle. The trees and plants are similar to those of Lefooga, to which it is joined by a reef.

HOLBEACH, a market town of Lincolnshire, eight miles east of Spalding, and 109 north from London. The town is of great antiquity, but indifferently built, and is seated in the fens. The church is a Gothic building, with a lofty tower and spire, which may be seen at a great distance. Market on Thursday.

IIOLBEIN (Hans or John), a celebrated painter born at Basil in Switzerland, in 1498. He learned the rudiments of his art from his father, who was also a painter ; but soon showed his superior genius. In the town-house of Basil he painted our Saviour's Passion; and in the fish market of the same city Death's Dance, and a Dance of Peasants, which were very much ad-

mired. Erasmus was so pleased with them, that he desired him to draw his picture, and was ever after his friend. He staid some years longer at Basil, till his necessities, occasioned by extravagance and an increasing family, made him comply with Erasmus's persuasions to go to England. In his journey he staid some days at Strasburg, where it is said he applied to an eminent painter for work, who ordered him to give a specimen of his skill. On which Holbein finished a piece with great care, and painted a fly on the most conspicuous part of it; after which he privately withdrew, and pursued his journey. When the painter returned home, he was astonished at the beauty and elegance of the drawing, and especially at the fly, which he at first took for a real one, and endeavoured to remove it with his hand. He now sent all over the city for his journeyman; but, after many en-quiries, discovered that he had been thus deceived by the famous Holbein. Holbein, having in a manner begged his way to England, presented a letter of recommendation from Erasmus to Sir Thomas More, and showed him Erasmus's picture. Sir Thomas, being then lord chancellor, received him kindly, and kept him in his house between two and three years : in which time he drew Sir Thomas's picture, and those of many of his friends. The chancellor, having now adorned his apartments with the productions of this great painter, resolved to introduce him to Henry VIII. For this purpose he invited that prince to an entertainment; having, before he came, hung up all Holbein's pieces in the great hall. The king, on his first entrance into this room, was so charmed with the sight, that he asked whether the artist was living, and to be employed for money. Upon this, Sir Thomas presented Hol-bein to the king, who immediately took him into his service. While he was here an affair happened which might have proved fatal to him, had he not been protected by the king. His fame attracted a nobleman to see him when he was drawing a figure after the life. Holbein sent to desire his lordship to defer the honor of his visit to another day; which the nobleman taking for an affront, broke open the door, and very rudely went up stairs. Holbein hearing a noise, came out of his chamber; and meeting his lordship at his door, fell into a violent passion; and pushed him down stairs. Immediately, however, reflecting on what he had done, he made the best of his way to the king, and the nobleman following him, the king ordered Holbein to ask his pardon; when the courtier would not be satisfied with less than his life. Upon this the king sternly replied, 'my lord, you have not now to do with Holbein, but with me-I can whenever I please make seven lords of seven ploughmen, but I cannot make one Holbein of even seven lords.' Holbein died of the plague at his lodgings at Whitehall, in 1554. He painted with equal excellence in every manner; in fresco, in water-colors, ir oil, and in miniature. His genius was sufficiently shown in the historical style, by two "celebrated compositions which he painted in the hall of the Stillyard company. It is worthy of remark that Holbein always painted with his left hand.

HOLBERG (Lewis), a Danish author, born at Bergen in Norway, in 1685. He rose from a menial state to be assessor of the Consistory court at Copenhagen. He wrote a History of Denmark, some comedies and miscellanies; for which he was created a baron. He died in 1754.

HOLCROFT (Mr.), was born in Orangecourt, Leicester-fields, December 22d, 1744. His father was a shoemaker, and, when Holcroft was in his teens, he was a servant to the honorable Mr. Vernon, his chief employment being to ride his master's race-horses, which were in training to run for the plate at Newmarket. He persevered to the age of twenty-five years, with some little interruption, in his father's trade. About that period of life, however, he conceived a passion for the stage, and offered his services at the same time to Mr. Charles Macklin, and Mr. Samuel Foote. Foote encouraged him, but Macklin talked to him in so specious a style, and held out to him so many temptations and prospects which were never realised, that he was induced to decide for Macklin and Ireland, a decision which he continued long to repent. In the profession of a player, Mr. Holcroft continued, not with the most flattering success, till after the production of the play of Duplicity, in 1781. Immediately on the exhibition of this comedy he withdrew from the stage as an actor, and for several years devoted his attention principally to dramatic composition. His writings of this kind were :- The Noble Peasant, an opera. The Choleric Fathers, an opera. The Follies of a Day, a comedy, translated from the French of Beaumarchais. Seduction, a comedy, 1786. The German Hotel, a drama, trans-lation, 1790. The School for Arrogance, a comedy, partly from the French of Destouches, 1791. The Road to Ruin, a comedy, and the best of his dramatic writings, 1792. Love's Frailties, a comedy, 1794. The Deserted Daughter, a comedy, 1795. The Man of Ten Thou-sand, a comedy, 1796. The l'orce of Ridicule, a comedy, 1796. He is much to Blame, a comedy, very successful, 1798. Knave or Not, a comedy, 1798. Deaf and Dumb, a comedy, from the French, very successful, 1801. The Tale of Mystery, an after-piece, from the French, 1802. Hear Both Sides, a comedy, 1803. The Vindictive Man, a comedy, 1806. Mr. Holcroft also exercised his talent, with advantage to his reputation, in the Novels of Anna St. Ives, published 1792, and Hugh Trevor, published 1794. He also produced a third novel, entitled Brian Perdue, in the year 1807. The public is further indebted to the pen of Mr. Holcroft for many translations. The Private Life of Voltaire, 12mo. The Memoirs of Baron Trenck, in 3 vols. 12mo. The Secret History of the Court of Berlin, by the Count de Mirabeau, 2 vols. 8vo. Tales of the Castle by Madame de Genlis, 5 vols. 12mo. The Posthumous Works of Frederic II. King of Prussia, 13 vols. 8vo. An Abridged Display of the Physiognomy of Lavater, 3 large vols. 8vo. Holcroft at the beginning of the French revolution displayed much zeal in the cause of liberty; and, his conduct having excited the alarm of government,

X 2

he was included in the prosecution for treason instituted against Hardy, Horne Tooke, and Thelwall, in 1794. But, these persons having been acquitted, Holcroft and the rest were discharged. He died in 1809. Holcroft is stated to have been the first who introduced on the English stage those popular entertainments termed melo-dramas.

HOLCUS, Indian millet or corn, a genus of the monæcia order, and polygamia class of plants, natural order fourth, gramina. Hermaphrodite CAL an unflorous or biflorous glume: cora a glume with an awn; there are three stamina, two styles, and one seed. Male CAL a bivalved glume: core none; but three stamina. There are thirteen species, two of which are natives of Britain. The most remarkable of these is

H. lanatus, or the creeping soft grass of Hudson. Anderson, in his Essays on Agriculture, says, this is one of the most valuable kinds of meadow grasses, its pile being exceedingly soft, close, and succulent. It delights in moisture, and is seldom found in dry ground, unless the soil be exceedingly rich. It is often found on those patches near springs, over which water often flows; and may be known by the uncommon softness and succulence of the blade, the lively light green color of the leaves, and the matted intertexture of its roots. But, notwithstanding the softness of its first leaves, when the seed-stalks advance they are rough to the touch, and the plants assume a very different appearance. The ear is branched out into a great number of fine ramifications like the oat, but much smaller. The seeds adhere to the stalk, and to each other after being separated from it, as if mixed with cobweb, so that they do not spread readily in sowing. But the running roots spread so fast, that a small quantity, sowed very thin, would soon stock a large field.

If. sorghum, or Guinea corn, is the most remarkable of the foreign species. The stalks are large, compact, and full eight feet high. In Senegal the fields are entirely covered with it. The negroes, who call it guiarnot, cover the ears when ripe with its own leaves to shelter it from the sparrows. The grain made into bread is esteemed very wholesome. With this the slaves in the West Indies are generally fed, each being allowed from a pint to a quart every day. The negroes on the coast of Guinea make of two kinds of this corn a thick-grained pap called couscous, which is their common food.

HOLD, in the old glossaries, is mentioned in the same sense with wold, i. e. a governor or chief officer; but in some other places for love, as heldlic lovely.

HOLD, v. a. Sax. healdan; low Germ. holden; Dan. holde; Germ. hallen, and haben, to have. To hold is a physical act, and signifies to have in a particular mode, as by the application of bodily strength in a greater or less degree: hence to keep; detain; retain; contain as within boundaries: the different uses and applications of this word are very numerous; it is used both in a literal and figurative sense.

To grasp in the hand; to gripe; to clutch.

Lift up the lad, hold him in thy hand. Genesis.

308

France, thou mayest *hold* a serpent by the tongue, A fasting tyger safer by the tooth,

Than keep in peace that hand which thou dost hold. Shakspeare.

To connect; to keep from separation. The loops *held* one curtain to another.

Exod. xxxvi. 12.

To keep; to retain; to gripe fast: not to let go.

Prove all things; hold fast that which is good.

2 Thes. v.

Too late it was for satyr to be told,

Or ever hope recover her again ;

In vain he seeks, that having cannot hold.

Faerie Queene.

His rugged shield was like a rocky mould, On which an anchor bit with surest *hold*:

I hold by being held,' was written round in gold. Fletcher's Purple Island.

To maintain as an opinion.

Thou hast there them that hold the doctrine of Balaam. Rev.

To consider; to regard.

I as a stranger to my heart and me

Hold thee from this for ever. Shakspeare.

To think of; to judge with regard to praise or blame.

What saw we, ekc, of hem that deliten hem in swering, and hold it a gentrie or manly dede to swere gret othes? Chaucer. The Persones Tale.

I hold him but a fool, that will endanger His body for a girl that loves him not.

Shukspeare.

One amongst the fairest of Greece,

That holds his honour higher than his ease. Id.

He would make us amends, and spend some time with us, if we *held* his company and conference agreeable. Bacon.

This makes thee, blessed Peace ! so light to hold, Like summer's flies that fear not winter's cold.

Fairfax.

As Chaucer is the father of English poetry, so I hold him in the same degree of veneration as the Grecians held Homer, or the Romans Virgil.

	Digueno
Ye Latian dames, if any here, Hold your unhappy queen Amata dear ! Hold such in reputation.	Id. Philip.
Minds	*

By nature great, are conscious of their greatness, And hold it mean to borrow ought from flattery. Rowe's Royal Convert

To receive, and keep in a vessel.

She tempers dulcet creams, nor these to hold Wants her fit vessels pure. Milton.

To contain; to receive into its capacity: as a hogshead holds sixty-three gallons; the sack is too little to hold the grain.

To keep; not to spill. Broken cisterns that can hold no water. Jeremiah. To keep; to hinder from escape. For this infernal pit shall never hold Celestial spirits in bondage. Milton. To keep from spoil; to defend. With what arms We mean to hold what anciently we claim Of empire. Milton. To keep from loss.

Man should better hold his place By wisdom. Milton. To have any station.

The star that bids the shepherd fold,

Milton. Now the top of heaven doth hold.

And now the strand, and now the plain they held ; Their ardent eyes with bloody streaks were filled. Dryden.

Observe the youth who first appears in sight, And holds the nearest station to the light. Id.

To possess; to have.

The castle, holden by a garrison of Germans, ho commanded to be besieged. Knolles's History.

Holding Corioli in the name of Rome,

Even like a fawning greyhound in the leash,

To let him slip at will. Shakspeare. Assuredly it is more shame for a man to lose that which he holdeth, than to fail in getting that which he never had. Hayward.

To possess in subordination.

He was willing to yield himself unto Solyman as his vassal, and of him to hold his seigniory for a yearly tribute. Kn. The terms too hard by which I was to hold Knolles.

The good. Milton.

To suspend; to refrain.

Men in the midst of their own blood, and so furiously assailed, held their hands, contrary to the laws of nature and necessity. Bacon.

Death ! what do'st ? O hold thy blow !

What thou do'st, thou do'st not know Crashaw.

To stop ; to restrain. We cannot hold mortality's strong hand.

Shakspeare.

Fell, banning hag! inchantress, hold thy tongue. Id.

Unless thou find occasion, hold thy tongue ; Thyself or others, careless talk may wrong

Denham. When straight the people by no force compelled, Nor longer from their inclination held, Waller.

Break forth at once. Hold your laughter, then divert your fellow-servants. Swift.

To fix to any condition.

His gracious promise you might, As cause had called you up, have held him to.

Shakspeare.

To keep ; to save. Stay but a little ; for my cloud of dignity Is held from falling with so weak a wind,

That it will quickly drop : my day is dim.

Shakspeare.

To confine to a certain state.

The Most High then shewed signs for them, and held still the flood, 'till they were passed over.

2 Esdr. xiii. 14.

To detain; to keep in confinement or subjec-

Him God hath raised up, having loosed the pains of death, because it was not possible that he should he holden of it. Acts.

To retain; to continue.

These reasons moved her star-like husband's heart; But still he held his purpose to depart. Dryden.

To practise with continuance.

Night

And chaos, ancestors of nature, hold Milton. Eternal anarchy.

Not to intermit.

Seed-time and harvest, heat and hoary frost, Shall hold their course. Milton. To solemnise; to celebrate.

He held a feast in his house, like the feast of a king . 1 Sam.

The king, the quene, and every lord, With all the ladies, by one accord,

Helde a generall assembly. Chaucer's Dreame.

The queen this day here holds her parliament But little thinks we shall be of her council

Shakspeare.

To conserve ; not to infringe. Her husband heard it, and held his peace,

Numb. xxx. 7. She said, and held her peace ; Æneas went, Unknowing whom the sacred sibyl meant.

Druden.

To manage; to handle intellectually.

Some in their discourse desire rather commendation of wit, in being able to hold all arguments, than of judgment in discerning what is true. Bacon.

Great souls

By nature half divine, soar to the stars And hold a near acquaintance with the gods. Rowe.

And there they stand, as stands a lofty mind Worn, but unstooping to the baser crowd, All tenantless, save to the crannying wind, Or holding dark communion with the cloud. Byron. Childe Harold.

To maintain.

309

Whereupon they also made engines against their engines, and held them battle a long season.

1 Mac. vi. 52.

To carry on conjunctively.

The Pharisees held a council against them.

Matt.

To prosecute or continue.

To hold forth; to offer; exhibit or propose.

Christianity came into the world with the greatest simplicity of thought and language, as well as life and manners, holding forth nothing but piety, charity, and humility, with the belief of the Messiah and of his kingdom. Temple.

Observe the connection of ideas in the propositions, which books hold forth and pretend to teach as truths. Locke.

My account is so far from interfering with Moses, that it holds forth a natural interpretation of his sense. Woodward.

To hold forth. To protend; to put forward to view.

How joyful and pleasant a thing it is to have a light held us forth from heaven to direct our steps !

Cheyne.

To hold in. To restrain; to govern by the bridle.

I have lately sold my nag, and honestly told his greatest fault, which is, that he became such a lover of liberty, that I could scarce hold him in. Swift.

To hold in. To restrain in general.

These men's hastiness the warier sort of you doth not commend; ye wish they had held themselves longer in, and not so dangerously flown abroad.

Hooker.

To hold off. To keep at a distance.

Although 'tis fit that Cassio have his place .

Yet, if you please to hold him off a while,

You shall by that perceive him.

Shakspeare. Othello.

The object of sight doth strike upon the pupil of the eye directly, without any interception; whereas the cave of the car doth hold off the sound a little from Bacon. the organ.

I am the better acquainted with you for absence, as men are with themselves for affliction : absence does but *hold off* a friend, to make one see him truly.

Pope to Swift. To hold on. To continue; to protract : to push forward.

I went forth, myself, alone boldily

And helde the way downe by a broke side.

Chaucer. The Cuckowe and the Nightingale. They took Barbarossa, holding on his course of Africk, who brought great fear upon the country.

Knolles's History.

If the obedience challenged were indeed due, then did our brethren both begin the quarrel and hold it on. Saunders.

To hold out. To extend; to stretch forth. The king held out to Esther the golden sceptre that was in his hand. Esth. v. 2.

To hold out. To offer; to propose.

Fortune holds out these to you, as rewards.

Ben Jonson. To hold out. To continue to do or suffer.

He cannot long hold out these pangs,

The incessant care and labour of his mind.

Shakspeare.

To hold up. To raise aloft.

I should remember him: does he not hold up his head, as it were, and strut in his gait?

Shakspeare.

The hand of the Almighty visibly held up, and prepared to take vengeance. Locke. To hold up. To sustain; to support by in-

To hold up. To sustain; to support by influence or contrivance.

It followeth, that all which they do in this sort proceedeth originally from some such agent as knoweth, appointeth, *holdeth up*, and actually frameth the same. *Hooker*.

The time misordered doth in common sense Crowd us, and crush us to this monstrous form, To hold our safety up. Shakspeare.

And so success of mischief shall be borne, And heir from heir shall hold his quarrel up. Id.

Those princes have held up their sovereignty best, which have been sparing in those grants. Davies.

There is no man at once either excellently good or extremely evil, but grows either as he *holds* himself up in virtue, or lets himself slide to viciousness.

Sidney.

Then do not strike him dead with a denial, But hold him up in life, and cheer his soul

With the faint glimmering of a doubtful hope.

Addison's Cato.

To keep from falling.

We have often made one considerably thick piece of marble take and hold up another, having purposely caused their flat surfaces to be carefully ground and polished. Boyle.

To HOLD, v.n.

To stand; to be right; to be without exception.

To say that simply an argument, taken from man's authority, doth *hold* no way, neither affirmatively nor negatively, is hard. *Hooker.*

This holdeth not in the sea-coasts. Bacon.

The lasting of plants is most in those that are largest of body; as oak, elm, and chesnut, and this holdeth in trees; but in herbs it is often contrary.

When the religion formerly received is rent by discords, and when the holiness of the professors of religion is decayed, and full of scandal, and withal the times be stupid, ignorant, and barbarous, you may doubt the springing up of a new sect; if then also there should arise any extravagant and strange spirit, to make himself author thereof; all which points held

when Mahomet published his law. Id. Nothing can be of greater use and defence to the mind than the discovering of the colours of good and evil, shewing in what cases they *hold*, and in what they deceive. Id.

Where outward force constrains, the sentence holds;

But who constrains me ? Milton. None of his solutions will hold by mere mechanicks. More.

This unseen agitation of the minute parts will hold in light and spirituous liquors. Boyle.

The reasons given by them against the worship of images, will equally hold against the worship of images among Christians. Stillingfleet.

The proverb *holds*, that to be wise and love, Is hardly granted to the gods above.

Dryden's Fables.

As if the experiment were made to hold For base production, and reject the gold.

Dryden.

This remark, I must acknowledge, is not so proper for the colouring as the design, but it will hold for both. Id.

The drift of this figure holds good in all the parts of the creation. L'Estrange.

Our author offers no reason; and, when any body does, we shall see whether it will *hold* or no. *Locke*.

The rule holds in land as well as all other commodities. Id.

It holds in all operative principles whatsoever, but especially in such as relate to morality; in which not to proceed, is certainly to go backward. South.

This seems to hold in most cases. Addison.

Sanctorius's experiment of perspiration, being to the other secretion as five to three, does not hold in this country, except in the hottest time of Summer.

Arbuthnot on Aliments.

The analogy *holds* good, and precisely keeps to the same properties in the planets and comets.

Cheyne.

In words, as fashions, the same rule will hold; Alike fantastick, if too new or old. Pope.

To continue unbroken or unsubdued. Our force by land hath nobly held.

Shakspeare.

To last; to endure.

We see by the peeling of onions, what a holding substance the skin is. Bacon.

Never any man was yet so old,

But hoped his life one Winter more might hold.

Denham.

To continue without variation. We our state

Hold, as you yours, while our obedience holds.

Milton. He did not hold in this mind long.

L'Estrange.

To refrain.

His dauntless heart would fain have held From weeping, but his eyes rebelled. Dryden.

To stand up for; to adhere.

Through envy of the devil came death into the world, and they that do hold of his side do find it. Wisd. in. 24.

They must, if they hold to their principles, agree that things had their production always as now they have. Hale.

When Granada for your uncle held,

You was by us restored, and he expelled.

Dryden.

Numbers hold

With the fair freekled king and beard of gold :

So vig'rous are his eyes, such rays they cast, Id. So prominent his eagle's beak is placed. To be dependent on.

The mother, if the house holds of the lady, had rather, yea and will, have her son cunning and bold. Ascham.

The other two were great princes, though holding of him; men both of giant-like hugeness and force. Sidney.

The great barons had not only great numbers of knights, but even petty barons holding under them.

Temple. My crown is absolute, and holds of none.

Dryden.

To derive right.

'Tis true, from force the noblest title springs ; I therefore hold from that which first made kings.

Dryden.

311

To maintain an opinion.

Men hold and profess without ever having examined. Locke.

To hold forth. To harangue; to speak in public; to set forth publicly.

A petty conjurer, telling fortunes, held forth in the L'Estrunge. market-place.

To hold in. To restrain one's self.

I am full of the fury of the Lord : I am weary with Jer. vi. 11. holding in.

To hold in. To continue in luck.

A duke, playing at hazard, held in a great many hands together. Swift.

To hold off. To keep at a distance without closing with offers.

These are interests important enough, and yet we must be wooed to consider them; nay, that does not prevail neither, but with a perverse coyness we hold Decay of Piety. off.

To hold on. To continue; not to be interrupted.

The trade held on for many years after the hishops became Protestants; and some of their names are still remembered with infamy, on account of enriching their families by such sacrilegious alienations. Swift.

To hold on. To proceed.

He held on, however, 'till he was upon the very point of breaking. L'Estrange.

To hold out. To last; to endure.

Before those dews that form manna come upon trees in the valleys, they dissipate, and cannot hold out. Bacon.

As there are mountehanks for the natural body, so are there mountebanks for the politick body; men that perhaps have been lucky in two or three experiments, but want the grounds of science, and therefore cannot hold out.

Truth, fidelity, and justice, are a sure way of thriving, and will hold out, when all fraudulent arts and devices will fail. Tillotson.

By an extremely exact regimen a consumptive person may hold out for years, if the symptoms are not violent. Arbuthnot.

To hold out. Not to yield; not to be subdued.

The great master went with his company to a place where the Spaniards, sore charged by Achimetes, had much ado to hold out. Knolles's History.

You think it strange a person, obsequious to those he loves, should hold out so long against importunity.

Boyle.

Nor could the hardest ir'n hold out Acainst his blows. Hudibras.

I would cry now, my eyes grow womanish; But yet my heart holds out.

Dryden's Spanish Friar. The citadel of Milan has held out formerly, after the conquest of the rest of the duchy. Addison ..

Pronounce your thoughts : are they still fixt

To hold it out, and fight it to the last !

Or are your hearts subdued at length, and wrought, By time and ill success, to a submission? Id.

As to the holding out against so many alterations of state, it sometimes proceeds from principles.

Collier on Pride.

To hold together. To be joined. Those old Gothick castles made at several times, hold together only, as it were, by rags and patches.

Dryden. To hold together. To remain in union.

Even outlaws and robbers, who break with all the world besides, must keep faith amongst themselves. or else they cannot hold together. Locke.

To hold up. To support himself.

All the wise sayings which philosophers could muster up, have helped only to support some few stout and obstinate minds, which, without the assistance of philosophy, could have held up pretty well of themselves. Tillotson.

To hold up. Not to be foul weather.

Though nice and dark the point appear,

Quoth Ralph, it may hold up and clear.

Hudibras.

To hold up. To continue the same speed.

When two start into the world together, the success of the first seems to press upon the reputation of the latter ; for why could not he hold up?

Collier of Envy.

To hold with. To adhere to; to co-operate with.

There is none that holdeth with me in these things but Michael. Daniel.

HOLD has the appearance of an interjection; but is the imperative mood. Forbear; stop; be still.

Hold, ho ! lieutenant-sir-Montano ! Gentlemen, Have you forgot all sense of place and duty ?

The general speaks to you-hold, hold, for shame '

Hold, hold ! are all thy empty wishes such !

A good old woman would have said as much.

Dryden.

HOLD, n. s. From the verb. The act of seizing; gripe; grasp; seizure. It is used with great frequency, both literally and figuratively, both for manual and intellectual agency. The verbs with which it is oftenest united are take, lay, and have.

Uzzah put forth his hand to the ark of God, and took hold of it ; for the oxen shook it. 2 Sam. vi. 6.

Those bards delivered no certain truth of any thing ; neither is there any certain hold to be taken of any antiquity which is received by tradition.

Spenser on Ireland.

The wits of the multitude are such, that many things they cannot lay hold on at once. Hooker

This is to give him liherty and power : Rather thou should'st lay hold upon him, send him To deserved death, and a just punishment.

Ben Jonson.

Let but them Find courage to lay hold on this occasion.

Blilton

Shakspeure.

He seized the shining bough with griping hold, And rent away with ease the lingering gold.

Dryden. The devil himself, when let loose upon Job, could not transport that patient good man beyond his temper, or make him quit his hold. L'Estrange.

The hand is divided into four fingers bending forwards, and one opposite to them bending backwards, and of greater strength than any of them singly, which we call the thumb, to join with them severally or united, whereby it is fitted to lay hold of objects of any size or quantity. Ray on the Creation.

Yet then, from all my grief, O Lord.

Thy mercy set me free,

Whilst in the confidence of prayer, My soul took hold on thee. Addison.

We are strangely backward to lay hold of this safe, this only method of cure. Atterbury.

He kept his hold,

Nor lost 'till beauty was decayed and old, And love was by possession palled and cold.

Granville.

Something to be held; support. If a man be upon an high place, without rails or good hold, he is ready to fall. Bacon.

Power of keeping.

On your vigor now

My hold of this new kingdom all depends. Milton.

Catch; power of seizing.

The law hath yet another hold on you. Shakspeare.

Prison; place of custody.

They lay him in hold, because it was not declared what was to be done with him. Hooker.

They laid hands on them, and put them in hold unto the next day. Acts.

The prisoner to his hold retired. Dryden. Custody.

King Richard, he is in the mighty hold Of Bolingbroke. Shakspeare.

Power; influence operating on the mind.

Fear is that passion which hath the greatest power over us, and by which God and his laws take the surest hold of us. Tillotson.

Rural recreations abroad, and books at home, are the innocent pleasures of a man who is early wise; and give fortune no more hold of him than of necessity he must. Dryden.

Let it consist with an unbeliever's interest and safety to wrong you, and then it will be impossible you can have any hold upon him, because there is nothing left to give him a check, or to put in the balance against his profit. Swift.

Hold of a ship. All that part which lies between the keelson and the lower deck.

Now a sea into the hold was got,

Wave upon wave another sca had wrought.

Dryden. Again the weather threatened,-again blew

A gale, and in the fore and after hold

Water appeared. Byron. Don Juan.

A lurking place: as the hold of a wild beast or deer.

A fortified place; a fort; a safe residence.

These separated themselves unto David, into the hold to the wilderness, men of might. Chronicles. He shall destroy the strong holds.

Jeremiah.

She driveth forth into our occan Thurghout our wide see, til at the last

Under an hold, that nempnen I ne can,

For in Northumberland, the wave hire cast, And in the sand hire ship stiked so fast, That thennes wolde it not, in all a tide : The wille of Christ was, ther she shulde abide. Chaucer. The Man of Lawes Tale.

HOL

It was his policy to leave no hold behind him ; but make all plain and waste. Spenser.

HOLD, is the whole interior cavity or belly of a ship, or all that part of her inside which is comprehended between the floor and the lower deck throughout her whole length. This capacious apartment usually contains the ballast, provisions, and stores of a ship of war, and the principal part of the cargo in a merchantman. The disposition of these articles with regard to each other, naturally falls under consideration in the article STOWAGE; it suffices in this place to say, that the places where the ballast, water, pro-visions, and liquors are stowed, are known by the general name of the hold. The several storerooms are separated from each other by bulkheads, and are denominated according to the articles which they contain, the sail-room, the bread-room, the fish-room, the spirit-room, &c.

One that retains any HOLD'ER, n. s. HOLD'ER, n. s. One that retains any HOLD'ER-FORTH, n. s. thing in his hand; a HOLD'-FAST, n. s. Stenant who holds lands under another Holder-HOLD'ING, forth, a public speaker, a preacher, or haranguer. Hold-fast, any thing which takes hold, as a hook or catch. Holding, a tenure; a farm; the burden or chorus of a song.

The holding every man shall beat as loud

As his strong sides can volley. Shakspeare. In times past holdings were so plentiful, and holders so scarce, as well was the landlord, who could not get one to be his tenant. Carew.

Whence some tub holdersforth have made

In powdering tubs the richest trade. Hudibras, The several teeth are furnished with holdfasts suitable to the stress that they are put to. Ray.

The makers and holders of plows are wedded to their own particular way. Mortimer.

He was confirmed in this opinion upon seeing the holderforth. Addison.

HOLDER (William), D. D. and F.R.S., a learned author, born in Nottinghamshire, and educated in Pembroke Hall, Cambridge. In 1642 he became rector of Blechingdon, Oxford; in 1660 Doctor of Divinity; was afterwards canon of Ely and St. Paul's, and sub-dean and subalmoner to king Charles II. He distinguished himself by teaching a young gentleman to speak who was born deaf and dumb, viz. Alexander Popham, son of colonel Edward Popham, who was some time an admiral in the service of the long parliament. Dr. Wallis however completed this task; for young Popham, having forgotten a great part of Holder's instructions, was sent to the doctor who restored him to the use of his speech. Holder published a book entitled The Elements of Speech; an essay of enquiry into the natural Production of Letters : with an appendix concerning persons that are deaf and dumb, 1669, 8vo. In the appendix he relates by what methods he brought Popham to speak. In 1678 he published in 410. a Supplement to

312

the Philosophical Transactions of July 1670, with some reflections on Dr. Wallis's letter there inserted. This was written to claim the glory of having taught Popham to speak, which Dr. Wallis in the above letter had arrogated to himself; upon which Waltis published a Defence of the Royal Society, and the Philosophical Transactions, particularly those of July 1670, in answer to the cavils of Dr. William Holder, 1678, 4to. Holder was skilled in the theory and practice of music, and wrote a Treatise of the natural Grounds and Principles of Harmony, 1694, 8vo. He wrote also a Discourse concerning Time, with Application of the natural Day, lunar Month, and solar Year, &c. 1694, 8vo. He died at London, January 24th, 1696-7.

HOLDSWORTH (Edward), a polite and elegant scholar, born about 1688, and trained at Winchester school. He was thence elected demy of Magdalen College, Oxford, in July 1705, took the degree of M. A. in April 1711, became a college tutor, and had many pupils. In 1715, when he was to be chosen a fellow, he left the college, because he would not swear allegiance to the new government. The remainder of his life was spent in travelling with young noblemen as a tutor: in 1741 and 1744 he was at Rome in this capacity. He died of a fever at lord Digby's house at Coleshill, December 30th, 1747. He wrote, 1. Muscipula, a poem, of which there is a good English translation by Dr. John Hoadley, in vol. 5 of Dr. Dodsley's Mis-2. Pharsalia and Philippi; or the cellanies. two Philippi in Virgil's Georgics attempted to be explained and reconciled to History, 1741, 4to. 3. Remarks and Dissertations on Virgil, published with several notes and additional remarks by Mr. Spence, 1768, 4to.

HOLE, n. s. Goth. Sax. and Dut. hol; Teut. hohl. A cavity, Hol'Low, adj. n. s. & v. a. HOL'LOW-HEARTED, adj. Hol'LOWLY, adv. perpendicular or otherwise; a per-Hol'LOWNESS, n. s. HOL'LOW-ROOT, n. s.

J foration; a cave; cell; mean habitation: arm-hole, the cavity under the shoulder. Hollow, excavated; this respects the body itself; the absence of its own materials produces hollowness: these words are used in a figurative sense ; applied to sound, noisy, like reverberations from a cavity : to character, unfaithful; insincere; dishonest; treacherous. Hollow-root, a plant.

He touched the hollow of his thigh. Gen. xxii. 25.

- Ne left he nought,

But through the verger he hath sought

If he might finden hole or trace

Wherethrough that me [I] mote forth by pace Or any gappe, he did it close.

Chaucer. Romaunt of the Rose. And for a countenance, in his hond he bore An holow stikke, (take kepe and beware !) In the ende of which an unce and no more, Of silver lumaile put was.

Id. The Chanones Yemannes Tale. Upon his bloody finger he doth wear

A precious ring, that lightens' all the hole.

Shakspearc. You shall arraign your conscience,

Id.

And try your penitence, if it be sound, Or hollowly put on.

O earth, bear witness,	
And crown what I profess with kind event,	
If I speak true; if hollowly, invert,	
What best is boaded me to mischief !	Id.
The southern wind,	
Now by his hollow whistling in the leaves,	
Foretels a tempest.	Id.
Who art thou, that lately didst descend	
Into this gaping hollow of the earth?	Id.
It is fortune's use	10,
D 1	

To let the wretched man outlive his wealth,

To view with hollow eye and wrinkled brow

Id. Merchant of Venice. An age of poverty. Thy youngest daughter does not love thee least;

Nor are those empty-hearted whose low sound Reverbs no hollowness. Id. King Lear.

I've heard myself proclaimed,

And by the happy hollow of a tree

Escaped the hunt.

313

If you throw a stone or a dart, they give no sound ; no more do bullets, except they happen to be a little hollowed in the casting, which hollowness penneth the air. Bacon.

I suppose there is some vault or hollow, or isle, behind the wall, and some passage to it. Id.

Hollow church papists are like the roots of nettles, which themselves sting not; but bear all the stinging leaves. Id.

Tickling is most in the soles, and under the armholes and sides. Id.

Conscience !

Poor plodding priests, and preaching friars make Their hollow pulpits ; and empty aisles

Of churches ring, with that round word.

Ben Jonson.

14

Id.

I have seen earth taken up by a strong wind, so that there remained great empty hollowness in the place. Hakewill

What could be expected from him, but knotty and crooked hollow-hearted dealings ? Howel.

Against the horse's side his spear

He throws, which trembles with enclosed fear ; Whilst from the hollows of his womb proceed Greans not his own. Denham.

A loadstone is so disposed, that it shall draw unto it, on a reclined plane, a bullet of steel, which, as it ascends near to the loadstone, may fall down through some hole, and so return to the place whence it began to move. Wilkins's Dædalus.

He seemed For dignity composed and high exploit; But all was false and hollow.

Milton. The holiow abyss

Heard far and wide, and all the host of Hell,

With deaf'ning shout returned their loud acclaim. Id.

The hollow-hearted, disaffected,

And close malignants are detected.

Hudibras. Look upon linen that has small holes in it: those holes appear black, men are often deecived in taking holes for spots of ink; and painters, to represent holes make use of black. Boyle.

Trees, rudely hollowed, did the waves sustain, Erc ships in triumph plowed the watery plain.

Dryden.

He frets, he fumes, he stares, he stamps the ground ; The hollow towers with clamours ring around. Id.

When Alexander first beheld the face

Of the great cynick, thus he did lament :

How much more happy thou, that art content

To live within this little hole, than I

Id. Who after empire, that vain quarry fly. Thence issued such a blast and hollow roar,

As threatened from the hinge to heave the door. Id.

314

Id.

HOL Some search for hollow trees, and fell the woods.

There are the tops of the mountains, and under their roots in holes and caverns the air is often detained. Burnet.

An heap of sand or fine powder will suffer no heliowness within them, though they be dry substances. Id.

A tortoise spends all his days in a hole, with a house upon his head. L'Estrange.

People, young and raw, and soft natured, think it an easy thing to gain love, and reckon their own friendship a sure price of any man's; but when experience shall have shewn them the hardness of most hearts, the hollowness of others, and the baseness and ingratitude of almost all, they will then find that a friend is the gift of God, and that he only who made hearts can unite them. South.

Multitudes were employed in the sinking of wells, and the hollowing of trees. Spectator.

I have frighted ants with my fingers, and pursued them as far as another hole, stopping all passages to their own nest, and it was natural for them to fly into Addison. the next hole.

A fine genius for gardening thought of forming such an unsightly hollow into so uncommon and agreeable a scene. Id.

The little springs and rills are conveyed through little channels into the main hollow of the aqueduct. Id. on Italy.

Forest grew

Upon the barren hollows, high o'ershadowing The haunts of savage beasts. Prior.

Himself, as in the hollow of his hand. Holding, obedient to his high command,

The deep abyss.

HOLERACEÆ, from holus, pot-herbs, the name of the twelfth order in Linnæus's fragments of a natural method, consisting of plants which are used for the table, and enter into the economy of domestic affairs. See BOTANY.

HOLIDAY (Dr. Barten), a learned divine and poet, was the son of a tailor in Oxford, and born there about 1593. He studied at Christ Church College, and in 1615 took orders. He had been admired for his skill in poetry and oratory: and now, distinguishing himself by his eloquence as a preacher, he obtained two bene-fices in the diocese of Oxford. In 1618 he went as chaplain to Sir Francis Stewart, when he accompanied Count Gondamore to Spain. Afterwards he became chaplain to the king; and before 1626 was made archdeacon of Oxford. In 1642 he took the degree of D. D. at Oxford; near which place he sheltered himself during the rebellion; but after the Restoration returned to his archdeaconry, where he died in 1661. His works are, twenty sermons, published at different times ; Philosophiæ politobarbaræ specimen, 4to.; Survey of the world, a poem in ten books, 8vo.; A translation of Juvenal and Persius; Technogamia, or the Marriage of the Arts, a comedy.

HOLILY, adv.	
HOLINESS, n. s.	li
HOLY, adj.	b
HOLY-GHOST, n. s.	>0
HOLY THURSDAY, n. s.	ti
HOLY-WEEK, n. s.	I
HOLY-DAY, n. S.	a

Sax.haliz; Dut. heygh; Goth. holg, from al, healthy, or whole, in a state of salvaon: in Gr. aylog; at. sanctus. Holy nd holiness, derived

from the northern languages, have now altogether a Christian signification, as referrible principally

to the life and temper of a Christian; and typically to religious acts, ceremonies, and places : it is principally to the mind what sanctity is to the outward garb; 'the latter may be counterfeited, the former cannot : it has, however, been used in a more extended sense as good; pious; consecrated; inviolable. Holiness is the titular appellation of the pope of Rome: holy-ghost, Sax. halts and zarz, the third person in the adorable Trinity: holy Thursday, the day on which the ascension of Christ is commemorated ; ten days before Whitsunday : holy-week, the week before Easter, called also Passion-week : holy-day, corrupted to holiday, the day of ecclesiastical festival; anniversary east; a day of gaiety and joy; a time that comes seldom.

And, plainly and generally, Sacrilege is to reve holy thing fro holy place; or unholy thing, out of holy place; or holy thing out of unholy place.

Chaucer. The Persones Tale.

This foule sinne is platly ayenst the Holy Gost. Al be it so that every sinne is ayenst the Holy Gost; yct, natheles, for as moche as bountee apperteineth proprely to the Holy Gost, and envie cometh' proprely of malice; therefore, it is proprely ayenst the bountee of the Holy Gost. Id.

Shortly therein so perfect he became That, from the first unto the last degree,

His mortal life he learned had to frame In holy righteousnesse without rebuke or blame.

Spenser. Faerie Queene.

This victory was so welcome unto the Persians, that in memorial thereof they kept that day as one of their solemn holy-days for many years after.

Knolles's History.

I here appeal unto the pope,

To bring my whole cause 'fore his holiness.

Shakspeare.

State, holy or unhallowed, what of that? Id. See where his grace stands 'tween two clergymen !

And see a book of prayer in his hand ! True ornaments to know a holy man. Id.

- An evil soul producing holy witness, Is like a villain with a smiling cheek. Id. Ill it doth beseem your holiness
- To separate the husband and the wife. Id. Thou would'st be great,

Art not without ambition ; but without

The illness should attend it: what thou would'st highly,

That would'st thou holily.

What, have I 'scaped love-letters in the holiday time of my heauty, and am I now a subject for them? Id.

He has deserved it, were it carbuncled

Like holy Phœbus' car. Id. Antony and Cleopatra. With joy he will embrace you; for he's honourable,

And, doubling that, most holy. Id. Cymbeline. Religion is rent by discords, and the holiness of the

professors is decayed, and full of scandal. Bacon.

And young and old come forth to play On a sunshine holiday. Milton.

Friendship, a rare thing in princes, more rare between princes, that so holily was observed to the last of those two excellent men. Sidney.

Rome's holidays you tell, as if a guest

With the old Romans you were wont to feast. Waller. Bare was his hoary head ; one holy hand

Held forth his laurel crown, and one his sceptre.

Dryden. Courage is but a holiday kind of virtue, to be scldom exercised. Id.

Is not the care of souls a load sufficient? Are not your holy stipends paid for this ? Id.

Id.

If strength of persuasion be the light which must guide us, I ask, how shall any one distinguish the inspirations of the Holy Ghost? Locke.

Common sense could tell them that the good God could not be pleased with any thing cruel; nor the most holy God with any thing filthy and unclean. South.

His holiness has told some English gentlemen, that those of our nation should have the privileges.

Addison on Italy.

Then in full age, and hoary holinese

Retire, great teacher, to thy promised bliss Prior. We see piety and holiness ridiculed as morose sin-

gularities. Rogers.

We know ourselves, our mission, and thine order; Waste not thy holy words in idle uses, It were in vain. Byron. Manfred.

HOLINESS, was anciently a title given to all bishops. The Greek emperors also were addressed under the title of Holiness, as being anointed with holy oil at their coronation. Du Cange adds, that some of the kings of England have had the same attribute; and that the orientals have frequently refused it to the pope.

HOLINSHED (Raphael), an English historian, famous for his Chronicles of England, Scotland, and Ireland, was descended from a good family in Cheshire; but neither the time of his birth, nor events of his life, are known. He appears to have been a man of considerable learning. His Chronicles were first published at London in 1570, in 2 vols. folio; and then in 1587, in 3 vols. In this second edition several sheets in the second and third volumes were destroyed, for containing some passages disagreeable to queen Elizabeth and her ministers; but these have since been printed apart. Holinshed was not the sole compiler of this work, being assisted in it by several other hands. The time of his death is unknown; but from his will, prefixed to Hearne's edition of Camden's Annals, it appears to have happened between 1578 and 1582

HOLITSCH, a manufacturing town of Hungary on the Morawa, first patronised as such by the emperor Francis I. The manufacture now chiefly cultivated is that of a species of white ornamental stone. In the neighbourhood is an estate cultivated by the government, as a model of agriculture. Population 4000, thirty-four miles south-east of Brunn.

HOLKAR (Jeswunt Rao), a modern Mahratta chief, who distinguished himself by his wars with the English. He first took arms under Moadjha Scindia, and succeeded Maharow Holkar, soubah of Malwa, in the command of the Deccan. He was now able to bring into the field 100,000 men, of whom one-half were cavalry. But engaging in several unfortunate wars with his neighbours, and with the English, his power and territories were very much diminished. Holkar commenced hostilities against the English in 1804, the result of which was a treaty concluded December 24th, the following year, by which all his maritime provinces were ceded to the British. In 1817 the insurrection of the Pindarrees induced Holkar again to make war on the English, but the defection of the Peishwa deranged his operations; and he was ultimately deprived of two-thirds of his remaining dominions. Ile died in 1825.

HOLLA, interj. & v.n. Fr. hola. A word HOLLOW, v.n. y used in calling to any one at a distance: to shout; to halloo; to hoot: hollow is written incorrectly for holla.

But I will find him when he lies asleep,

And in his car I'll holla Mortimer !

What halloing and what stir is this to-day?

Shakspeare.

List, list! I hear

Some far off holla break the silent air. Milton. This unseen judge will wait, and in your ear

Will hollow rebel, tyrant, murderer. Dryden.

I pass for a disaffected person and a murderer, because I do not hoot and hollow, and make a noise.

Addison.

He with his hounds comes hollowing from the stable, Makes love with nods, and kneels beneath a table.

Pope.

HOLLAND, n. s. Fine linen made in Holand.

Some for the pride of Turkish courts designed For folded turbants finest holland hear. Dryden.

HOLLAND, NORTH and SOUTH, are two important provinces of the kingdom of the Netherlands, that have often given name to the Seven United Provinces, but these appellations have been merged in the title of the kingdom : and Holland is now, properly, the maritime peninsula of that name, divided into the two parts we have specified. It is bounded on the north and west by the German Ocean, on the east by the Zuider Zee and the ci-devant state of Utrecht. and on the south by the Meuse and Dutch Brabant; extending from lat. 51° 40' to 53° 10' N.: its longitude is about 180 miles east of London. The length of the whole, including the Texel and the other islands of the Meuse, is about ninety miles; the breadth is various, from fifteen to forty-eight, the greatest breadth being southward. It contains ninety walled towns, besides many others, and above 400 villages. Before the Revolution, in 1795, six large cities had seats in the states general, viz. Dort, Haer-lem, Delft, Leyden, Amsterdam, and Gouda. The number of inhabitants was estimated at 800,000. They also reached this number in 1801; but in 1817 they had been reduced by the war to 748,000.

The soil is so soft and marshy, that, but for the constant care in forming ditches and canals, it would be hardly capable of cultivation; some part of it lies even lower than the sea, from which it is secured by dikes, twenty-five cr thirty feet high, and as many broad at top. The meadow grounds are rich, and feed great numbers of cows; the making of butter and cheese being a principal occupation. These meadows are generally under water during the winter, and the inhabitants only discharge them from it by mills adapted, as in the fenny parts of England, to this particular purpose. The Hollanders are affable, industrious, laborious, absorbed in trade, excellent sailors, moderate, poli-ticians, and lovers of liberty. A free exercise of religion is allowed to all persuasions, but Calvinism is the most prevailing.

Holland now sends twenty-two members to the States General, and, in point of jurisdiction, is under the high court of the Hague. The division into the two governments of South and North Holland is recognised by the constitution of 1814; the former containing 1170 square miles, with 389,000 inhabitants, and being divided into the six districts of the Hague, Leyden, Rotterdam, Dort, Gorcum, and the Briel; while North Holland, which, in official papers, is called by its ancient name of West Friesland, contains 930 square miles, with 359,000 inhabitants, and is divided into the four districts of Amsterdam, Haerlem, Hoorn, and Alkmaar.

The following is the population of the chief towns:-

Amsterdam		200,000
Rotterdam		54,000
Hague .		42,000
Leyden .		31,000
Haerlem		20,000
Dort .		19,000
Delft .		14,000
Gouda .		12,000
Alkmaar		10,000
Hoorn .		9,000

This country was anciently inhabited by the Batavians, who derived their origin from the Catti, a people of Germany. Having been obliged to abandon their country on account of civil wars, they came to establish themselves in an island, formed by the waters of the Rhine and Wahal or Leck, and named their country Batavia or Betuwe, from Batton, the son of their king. These people served in the Roman armies in quality of auxiliary troops; and historians inform us, that some of them were at the battle of Pharsalia. They formed the ordinary guard of the emperor Augustus. The services which they rendered Germanicus, in Germany, were so important, that the senate gave them the appellation of brothers. They had afterwards a considerable share in the conquest of Britain, under Plancius and Agricola. They strengthened the party of Galba, and afterwards that of Vitellius; and it was principally to their valor that Julian the Apostate was indebted for the victory he obtained over the Germans near Strasburgh. The name of Holland is said to have been given it on account of the vast and thick forests of wood with which it was at one time covered; Holtlant, in German, signifying woodland. Others think that the Normans, who made a descent here about 836, gave the country this name; founding their opinion on the resemblance of names found in this country to those in Denmark and Norway, the ancient re-sidence of the Normans; as Zealand, Oland, Schagen, Bergen, &c. On the decline of the Roman empire, the Batavians, having thrown off their yoke, came under the dominion of the Saxons, and then of the French, under Childeric I. king of France. The Normans and the Danes were the next masters, from the time of Charlemagne, and ravaged the country three times with fire and sword. When they were driven away, Charles the Bald, emperor and king of France, erected Holland into a county in 863, in favor of Thierry, duke of Aquitaine,' who, five years after, was also made count of Zealand, by Louis king of Germany. In 1299 the county of Hol-

land devolved to the counts of Hainault; and in 1436 it fell to Philip the Good, duke of Burgundy, and afterwards to the emperor Maximilian, whose descendant, Philip II. king of Spain, was the last count of Holland; the seven provinces revolting from him, and after a long struggle forming an independent republic. The states of this province had the title of the states of Holland and West Friesland, and were formed of the nobility and towns. The number of the nobility admitted into the assembly was not limited, and not always the same; they were elected by a majority of votes, and rarely exceeded ten. The towns which had a right to send deputies were originally six, but at last eighteen, of which seven were in North Holland, and eleven in South Holland. The number of deputies sent by each town was not fixed. In the late war Holland at first appeared hostile to the new republic, but never heartily co-operated with the allies. The stadtholder was willing to co-operate heartily with Britain and Prussia, but a party more powerful than his own were his enemies, and, on the invasion of Holland by the French, in the beginning of 1795, the stadtholder with his family took refuge in England. Holland was now under various forms of French domination until the year 1813. The Batavian republic was established under the authority of France in 1795; and transformed into the kingdom of Holland, and Louis Bonaparte proclaimed king on the 5th of June, 1806. On the 1st of July, 1810, Louis abdicated the throne in favor of his eldest son, and retired as a private citizen into Bohemia. But this did not meet with Napoleon's approbation, and he incorporated Holland with the French empire on the 9th of the same month. At length the people became weary of this connexion. The events of 1813 had weakened the power that bound them; the people rose, their fetters were broken, and 'Orange boven' (up with the House of Orange), resounded through the country. A provisional government was formed at Amsterdam on the 18th of November. William Frederick, of Nassau and Orange, landed from England at the close of the same month, entered Amsterdam on the 2nd of December, and was proclaimed Sovereign Prince of the United Netherlands, on the following day. By the act of congress, signed at Vienna on the 31st of May, 1815, the seventeen provinces of the Netherlands, which had formerly been subject to the dukes of Burgundy, were re-united under the prince of Orange, as William I., king of the Netherlands. See NETHERLANDS.

HOLLAND, NEW, an island of the South Pacific Ocean, the largest in the world, and long supposed to form part of a great southern continent. The Portuguese and Spaniards appear to have visited it in the sixteenth century, but it was the Dutch who first made it known to Europe. In 1605 they coasted it along the western shore as far as 13° 45' of S. lat.; the farthest point of land in their map being called Cape Keer Weer, or Turn-again. In 1616 the west coasts were discovered by Dirk Hartag, commander of an outward bound vessel from Holland to India; and in the year 1801 there was found, by some of the

navigators by whom that coast was visited, a plate of tin, with an inscription and date, in which it was mentioned that it had been left by him. In 1627 the south coast was discovered for an extent of 1000 miles, by a ship commanded by Pieter Nuyts. In 1628 the west coast was again visited by several of the Dutch East India vessels; and in the following year a Dutch ship, commanded by captain Pelsart, was wrecked on the coast. In 1642 Abel Tasman was sent by the Dutch East India Company to complete the survey of the coast ; and he accordingly visited the northern shores of New Holland, which he called Anthony Van Diemen's Land, to distinguish it from Van Diemen's Land, in the south, previously discovered. In 1644 the western coasts were further explored by Tasman, but little is known of his discoveries in this quarter. It only appears that he represented the people as savage, and going naked, and that he could not understand their language. They once came to the number of fifty, double armed, dividing themselves into two parties, intending to have surprised the Dutch, who had landed twenty-five men; but the firing of guns frightened them, so that they fled. Their prows are made of the bark of trees : their coast is dangerous: there are few vegeta-bles: the people use no houses. The inhabitants are very numerous, and threw stones at the boats sent by the Dutch to the shore. They made fires and smoke all along the coast, which, it was conjectured, they did to give notice to their neighbours of strangers being upon the coast. They appear to live very poorly, go naked, and eat yams and other roots.

In 1688 Dampier fell in with this island, and visited it again 1699. He describes the inhabitants as the most miserable people in the world, without houses, and clothes; black, tall, thin, straight bodied, 'with small limbs, great heads, and heavy brows.' Their eyelids are always half closed, to keep the flies out of their eyes, which are here so troublesome, that no fanning will drive them away from the face; and without the assistance of both hands to keep them off, they will fill one's nostrils and mouth too, if the lips are not shut close; so that from their infancy, being thus annoyed with those insects, they never open their eyes like other people, and consequently cannot see far, unless they hold up their heads as if they were looking at something over them. They have great bottle noses, pretty full, and wide mouths; are long visaged, and of most unpleasant aspect.

Captain Cook in 1770 traced its eastern side with an accuracy that left little to be performed by his successors. Since the voyage of this great navigator, the separation of Van Diemen's land has been ascertained by the enterprising Bass; and the voyages of D'Entrecastaux, Baudin, and Flinders, have completed the outline of the coasts.

The eastern coast, or NEW SOUTH WALES (which see), commences at Cape York, in 10° 30' S. lat., and terminates at Wilson's Promontory in Bass's Strait, in 39° 0' including an extent of 700 leagues. A chain of mountains appears to run parallel to this coast, through its whole length, whose bases are from ten to thirty leagues from the sea. Until very recently all attempts to pass this natural barrier have been unsuccessful. It has, however, at last been overcome, and, instead of the sandy deserts or the inland seas with which conjecture had occupied the interior, the discovery of beautiful meadows, watered by considerable rivers and by chains of ponds, has given to the colonists new prospects of extension and riches. The coasts towards the south are in general elevated and covered with lofty trees. Towards the north they are lower, bordered with mangrove swamps, and lined with a labyrinth of islets and coral reefs. The Blue Mountains, which rise behind the seat of the colony, at the distance of thirty miles, are a mixture of primitive and secondary rocks, and have not yet been discovered to contain any metal.

The rivers which empty themselves on the east coast are few, and of no magnitude in proportion to the extent of the country. The Hawkesbury, which is the most considerable, empties itself into Broken Eay, north of Port Jackson, and, though deeply encased, it often overflows, and has several times swept away the buildings and corn magazines on its banks.

At Port Jackson the climate is nearly similar to that of the Cape of Good Hope. In December the heat is greatest, the thermometer sometimes rising to 112°, and the grass has been known to take fire spontaneously. Short intervals of north-west wind sometimes bring a degree of suffocating heat, equal to the scirocco or kamsin, while at others masses of ice eight inches long fall as hail. Tremendous storms, attended with thunder and lightning, have also occasionally occurred, and a shock of an earthquake was experienced in 1801. The climate is nevertheless extremely healthy; and in July and August, the winter of this hemisphere, the coolness of the air is invigorating and pleasant.

The principal trees met throughout New Holland are the eucalyptus, or gum tree, of various kinds, and the casuarina, or beef wood of the colonists of Port Jackson. With the exception of some bad roots, and a few berries, nature seems to have denied this vast country any species of alimentary vegetable, but all those of Europe and many of the tropics have been introduced into the colony.

The native dog excepted, all the quadrupeds discovered in New Holland approach the didelphus genus, by the pouch or sack formed of the skin of the belly, and in which their young take shelter when alarmed. The largest of these animals is the kangaroo, which grows to the length of five feet. A smaller species, named brush kangaroo, is the size of the hare; and the little animal named the kangaroo rat is only so called from its diminutive bulk. The womat is the size of a turnspit dog, and has some resemblance to the hear. The tachyglossus has the figure of the porcupine of Africa and the manner of feeding of the ant-eater of America. The amphibious mole, ornithorincus, is a very singular animal, having the jaws of a quadruped terminated by the bill of a duck, the feet webbed and with claws, and, from the absence of breasts in the female, it is supposed to be oviparous; it is about sixteen inches long, and lives in fresh

water ponds The flying opossum has its name from the long leaps it takes from tree to tree, and which it is enabled to do by the skin which unites the fore and hind legs on each side of the body. The native dog is of the jackal species, and never barks; though it follows the native, it is not to be entirely domesticated.

The birds, which are particularly deserving mention, are the cassowary or enu, the menura superba, a pheasant which unites the beauties of the bird of paradise and the peacock. Among the parrot tribe are many beautiful species, and particularly the large white and the black cockatoo. Aquatic birds are numerous, and among them are a gigantic pelican, some new species of geese and ducks, and the black swan, which is met in vast numbers towards the south. The other birds are the brown eagle, several species of falcons, crows, kingfishers, bustards, pigeons of several species, quails, curlews, herons, &c.

Lizards and snakes are met with in abundance, and swarms of winged insects darken the air, particularly moths, of which the variety is endless.

The indigenous population of New Holland are of the grand stock of Oceanic Negroes, having the hair frizzled but not woolly, the nose flat, nostrils large, mouth enormously wide, lips thick, and eyes hollow; the teeth are white and even, the sight extremely quick, the limbs disproportionably slender, doubtless from their miserable nourishment. In some the complexion is as black as the African negro, while others are nearer a copper color. Their thick bushy beards, and the bones and reeds they stick in their noses, give the men a horrible appearance, which is not improved by the daubing their faces with red or white clays, and anointing their bodies with stinking fish oil, which, collecting the dust, forms a crust of filth that defies the sting of the musquito. Although they seem at times to feel very sensibly the chilliness of the air, they have no idea of any other clothing than a few skins of dogs or opossums sewed together, with which they cover their shoulders, and which are only used by the men, the women going entirely naked. In every other respect the New Hollanders seem to be the people under the sun who have made the least progress in civilisation.

The food of those who inhabit the coasts is confined to the fish they strike with their spears, or which their women take with hook and line, and to the shell-fish they detach from the rocks at low water; an occasional dead whale also, that drives ashore, affords them a feast, which they never quit until it is all devoured. Those who inhabit the woods subsist on the few opossums and other animals they can catch, on wild honey, lizards, and worms.

Their huts are composed of branches of trees, shaped like an oven, the fire-place before the cpening, while the smoke and ordure remain inside, and here they sleep pell-mell with their knees to their mouths. Their canoes are of bark tied at the ends and extended by cross sticks. Their weapons are spears pointed with bones of animals or fish, or with bits of spar, clubs and bucklers of bark. Their implements are a stone

adze, their fishing hooks of pearl-shell, and their lines of the inner bark of a tree.

Their societies consist of tribes of twenty to thirty individuals, who are distinguished by the word gal added to the name of the district they occupy; thus Botany Bay is called Gwea, and its tribe Gwea-gal. Polygamy is general, and the manner of procuring a wife is unparalleled in brutality. The man who fancies a girl watches until he finds her unprotected by any of her tribe, when he fells her to the ground with his club, and drags her bleeding and senseless to his hut, where the marriage is consummated in a manner too disgusting for description; and she afterwards follows him as his wife, without the smallest idea of escaping from the frequent repetition of the most barbarous treatment.

Among their singular customs is that of depriving the women of the two first joints of the little finger of the left hand. One tribe has also the right of extracting a front tooth from the young men of other tribes; and recently women have been met with, in the interior, with but one eye, being deprived of the other as it would appear intentionally.

The New Hollander's ideas of a future state extend to the belief, that after death they return to the clouds, whence they originally dropped, an idea also found amongst the Alforezes of Ceram. They are the slaves of superstition, believing in magic, witchcraft, and spectres; hence they will not approach a grave. They also draw omens from falling stars, and have charms against thunder and lightning. The young people are buried, but warriors past the middle age are burned. The horrible custom also prevails of burying the suckling infant with its mother, and the foctus is often destroyed in the womb; both which practices doubtless arise from the difficulty of rearing children. Nevertheless these savages are not entirely devoid of the feelings of human beings : they have been seen to weep over the graves of their friends or relations; they show a high respect for old age; and they have not that irresistible propensity to thieving which marks the islanders of the Pacific.

The language of the tribes that inhabit the colony is sonorous and not disagreeable to the ear; but those who live both to the north and south have dialects radically different from each other, and from any known language.

On the separation of the British American colonies from England, she was at a loss where to send those criminals whom the law did not condemn to capital punishments, or whose sentence of death the sovereign mitigated. The west coast of Africa, between Cape Negro and the Cape of Good Hope, was first thought of for this purpose; but, on the recommendation of Sir Joseph Banks, New South Wales was fixed upon, and in 1788 the fleet with the persons intended to found the settlement arrived at Botany Bay; but, this place being found ineligible, the governor Philip made choice of Port Jackson, twelve miles farther north, which had been seen and named, but not examined by Captain Cook, and the infant town received the name of Sydney. Although in its infancy the colony had to contend against great difficulties, arising from the necessity of procuring every species of provision from England, and above all from the evil habits of the colonists, and latterly from the dissensions amongst the chief persons forming its government: nevertheless such is the force of the innate principle of man to better his condition, that, in spite of every obstacle, the colony has always advanced, and has at last become nearly independent for necessaries of the mother country. See WALES, NEW SOUTH.

In 1811 the colonial shipping consisted of twenty-nine vessels, from fourteen to 186 tons, chieny employed in conveying coals from Coal River, corn from the Hawkesbury and George's River, and sealing among the islands in Bass's Strait.

Port Jackson is an excellent harbour, entered between two high steep heads, and penetraing many miles, forming upwards of 100 coves. The only danger is a ledge of rocks across the entrance, leaving a channel on each side with four fathoms depth. Sydney Town is composed of good houses of stone and brick, of the officers of government and chief free settlers; the habitations of the lower class are of wood, plastered. The public buildings are a church, barracks, a jail, orphan school, a stone bridge over a little creek which receives a small run of fresh water, and the government-house.

The out settlements immediately dependent on Sydney are Paramatta at the head of the harbour, consisting of barracks, a government-house, church, and jail, with a street of dwelling houses. The Greenhills or Hawkesbury, on the banks of the river of this name, consists of a large granary of brick, and a number of wooden dwelling-houses. An establishment was found in 1805 at Coal River, in Port Hunter, north of Port Jackson, which received the name of King's Town.

The topography of New Holland, after taking leave of the colony of Port Jackson, offers little more than barren names. We shall, however, endeavour to present the reader with an idea of its principal points. Commencing at Cape York, which forms the south side of Endeavour Strait of Cook, the coast trends south-east to Cape Flattery, and then S.S.E. to Magnetic 1s-South of Cape Flattery is Endeavour land. River, where captain Cook observed alligators and oysters of an enormous size. The natives baked their victuals in holes in the ground. From Magnetic Island, so named from the vacillation of the needle near it, the coast again takes a south-east direction, to the Great Bay of Inlets of Cook, before which are many islands; and from the latitude of 17° to 23° a chain of coral reefs defends the coast from the attacks of the sea, and has been named by captain Flinders Barrier Reefs. In Broad Sound the tide rises thirty or thirty-five feet. No fresh water was found on its shores, and this necessary object is only found in stagnant pools in Shoal-water Bay, where captain Flinders observed puminice stone washed up on the shore. The eastern direction of the coast ends at Sandy Cape, the south point of Hervey Bay, where the huts of the natives were observed by Cook to be constructed with more solidity than to the south. Glass-house Bay was named from several hills behind it resembling those edifices. It receives some rivers, considerable in comparison with the scanty rills met on all the rest of the coast to the north; and pummice stone was found on its shores.

From Point Look-out the coast takes a direction to the west of south, and has no place of shelter to Port Stephens, where commences the immediate territory of the colony of Port Jackson, named Cumberland County. Port Stephens (Yaca-aba of the natives) is full of shoals, and only fit for small craft. Broken Bay is a large expanse of water, dividing into many branches, and receiving the river Hawkesbury, the most considerable of New Holland; it is navigable to the settlement at the Green Hills, ninety miles from the sea; but about twelve miles above this, its bed is crossed by a bar of rocks.

South of Port Jackson the coast has been minutely explored, and found to possess the following places in succession. Botany Bay, thus named by Sir Joseph Banks, from the great variety of plants found on its shores; it is a large expanse of water, but so filled by banks as to afford no anchorage for ships, except exposed to the sea. Its shores are also in many places swampy. It receives George's River, of considerable size, on which are some farms, whose produce is sent by sea to Sydney.

From Cape Howe the coast takes an abrupt westerly direction, trending about south-west to Wilson's Promontory, in Bass's Strait. This promontory, which is the south point of New Holland, is a vast mass of granite, joined to the continent by a narrow low isthmus. Between it and Cape Howe the shore presents an unbroken continuity of white sandy beach.

On the south coast of New Holland, in Bass's Strait, are Western Port and Port Philip. The former, discovered by Bass, has since been examined by Baudin, and found to contain two islands instead of one. It is a large basin, fit for the reception of ships of burden.

Port Philip, discovered by lieutenant Grant, is entered from a large bay, to which the English navigator gave the name of King, and the French that of Talleyrand. From an entrance only half a mile wide Port Philip expands to a basin 150 miles in circuit. Its shores are in general moderately clevated and sandy, but covered with wood, particularly the casuarina. Except a small river, which it receives, it is almost totally destitute of fresh water, and hence the intention of forming an establishment here was abandoned.

From Cape Albany Otway (Cape Marengo of the French) the west point of Bass's Strait, the coast takes a direction to the porth of west. The whole extent, from 130° of longitude to Bass's Strait, was visited nearly at the same time by captain Flinders, and Baudin the French navigator.

From Cape Bridgewater (Montaigne) to the Gulf of St. Vincent (Bay Josephine) the coast is composed of sandy cliffs, and frightfully barren. Spencer's Gulf (Gulf Buonaparte) is separated from that of St. Vincent by a peninsula named York by captain Flinders, and Cambaceres by the French; it is seventy leagues deep and ten to twenty-five broad, and terminates in a mangrove swamp. Near the entrance of the gulf, on the west shore, is Port Lincoln (Champagny), an excellent harbour, formed by three basins, whose entrance is covered by an island.

The coast which forms the west shore of the Australian Bight of Flinders, was discovered by Nuyts, in 1627. From the head of the bight to longitude 123° it is composed of sandy cliffs, from 400 to 600 feet high, forming a level platform, with very few trees, and beyond which inland nothing is visible from the sea. On this singular line of coast captain Flinders observes, ' that the equality of elevation, and the evidently calcareous nature, seem to bespeak it to have been the exterior line of a vast coral reef, which is always more elevated than the interior part. From the gradual subsiding of the sea, or perhaps by a sudden convulsion of nature, this bank may have attained its present height above the surface of the sca; and on this supposition, together with the fact of no hill or elevation being seen within it, it may be presumed, that in that direction there is either a low sandy plain, or the bank may be a barrier separating the external from an internal sea.' Behind the Lucky Bay of Flinders is a fresh water lake, a mile in extent, communicating with the sea by a rivulet. The coast continues low and sandy, with some intervals of barren hills, apparently granite, to King George the Third's Sound of Vancouver.

This is a large gulf with two good ports. The shores are composed of perpendicular cliffs, or sand-hills, behind which, in the interior, rise high mountains, whose white and elevated summits resemble vast edifices in runs; Mount Gardner has the appearance of being a volcano. On some of the promontories perfect coral is found, at the height of 1000 feet above the sea.

The south-west part of New Holland is named in the maps Leeuwin, or Lion's Land, from the Dutch ship that first visited it in 1660. Cape Leeuwin is the south-west point.

The land of Edels comprehends the middle of the west coast. Swan River in 32° 4', was ascended by the French twenty leagues, and found to run through a low country, traversed by calcarcous strata, and covered with large eucalyptus.

Endracht, or Concord Land, extends along the northern part of the west coast, under the tropic.

The Shark's Bay of Dampier is surrounded by sandy shores, hut wooded. Dampier mentions seeing here rabbits with very short fore legs, evidently the kangaroo. The French naturalists observed that these coasts are covered with petrified shells, and that the incrustations calcareo-greeous formed them. The peninsula of Peron divides Shark's Bay into two galfs, both forming good roads, but devoid of fresh water.

De Witt's Land includes 'all the north-west part of New Holland, and is the least explored.

The points seen by Dampier are composed of sandy downs, with fir-trees (doubtless the casuarina) and no water. Cape Murat of the French seems to be the Cape William of the Dutch. Capes Poivre, Malouet, and Dupuy, in 20° 30', form a great promontory, between which and Rosemary Island, one of the archipelago of Dampier, the coast is entirely unexplored.

About the 121° there is an opening not examined, twenty-six leagues in breadth, whence the coast extends to the north-west and north. It is not certain whether Cape Missiessy in 19° 12', and Cape Vallerat in 18° 12', are on an island or the continent. From Cape Hugyens, in 17° 38', the coast lies north. Near the Cape is Gantheaume Island, of considerable size.

From Cape Rhulière to Cape Van Diemen in 11° 10', the coast forms a great gulf to the south-east, and the land of De Witt terminates at the latter Cape.

The land of Arnheim extends from Cape Van Diemen to the gulf of Carpentaria. In Van Diemen's Bay, on this coast, the sea is said to be occasionally luminous, and hence this phenomenon probably spreads into the Banda Sea, as already noticed. Further east the Dutch charts mark Difficult Bay, which receives the river Speult, and before which is Crocodile Island.

The gulf of Carpentaria in the old Dutch charts presents such a number of rivers, that it was generally considered as receiving almost all the fresh waters of New Holland. Captain Flinders, who sailed entirely round it, found that not one of these supposed rivers has any existence; but, on the contrary, that fresh water is generally more scarce here than even on the east coast. The western side of the gulf is moderately elevated and lined by chains of considerable islands, while the eastern coast presents a continuity of very low sandy shores, entirely free from islands. The principal trees are the eucalyptus and casuarina.

The first considerable bay on the west shore is that of Arnheim, before which are the Wessels and English Company's Islands, composed of sterile hills, but with valleys, through which run streams of fresn water, and in which are found the wild nutmeg and cabbage palm. These islands are visited by Malay proas from Timor and Macassar to procure trepang. Groot Island, of the Dutch charts, named Busching by the German geographers, is before Limmen's Bight. Sir Edward Pellew's Islands, farther south, abound in the cabbage palm and kangaroos; and Wellesley's Group, the last towards the head of the gulf, are frequented by innumerable green turtle.

The natives seen by captain Flinders in the gulf, differed in no respect from those of Port Jackson, except in having lost two of the upper front teeth, and in being circumcised. A curious fact in the history of these savages, unless it is supposed that they have adopted this practice from the Mahommedan Malays who visit the gulf, which is not, however, probable. The cances of these people are composed of strips of bark, whose edges overlay each other and are sewed together. HOLLAND (Philemon), M. D., commonly called the translator-general of his age, was educated in the university of Cambridge. He was long a schoolmaster at Coventry, where he also practised physic. He translated Livy, Pliny's Natural History, Plutarch's Morals, Suetonius, Ammianus Marcellinus, Xenophon's Cyropædia, and Camden's Britannia, into English; and the geographical part of Speed's Theatre of Great Britain into Latin. The Britannia, to which he made many useful editions, was the most valuable of his works. It appears from the date of the Cyropædia, that he continued to translate till he was eighty years of age. He died in 1636, aged eighty-five.

HOLLAR (Wenceslaus), a celebrated engraver, born at Prague in 1607. His parents were in a respectable line of life; and he was at first designed for the law. But the civil commotions which happened in his youth, ruining his family affairs, he was placed with Marian, a very able designer and engraver of landscapes, under whose instructions he made rapid progress. He now principally excelled in drawing geometrical and perspective views and plans of buildings, ancient and modern. He travelled through several of the great cities of Germany; but, notwithstanding his merit, met with so little encouragement, that he found it very difficult to support himself. The earl of Arundel being in Germany, however, took him under his protection, and recommended him to king Charles I. of England. He engraved a variety of plates from the Arundel collection, and the portrait of the earl himself on horseback. The civil wars which happened soon after in this country ruined his fortune. He was taken prisoner, with some of the royal party, and with difficulty escaped; when he returned to Antwerp, and joined his old patron. Here he settled for some time, and published a considerable number of plates ; but, his patron leaving the place, Hollar fell again into distress, and was obliged to work for the booksellers. At the Restoration he returned to England, where he still could but barely subsist; and the plague, with the succeeding fire of London, putting a stop to business for some time, his affairs were so much embarrassed, that he never afterwards obtained a tolerable maintenance. It is said that he used to work for the booksellers at the rate of fourpence an hour; and always had an hour-glass before him. He died in 1677. His works amount nearly to 24,000 prints, according to Vertue's Catalogue; and the lovers of arts are zealous to collect them. They are etchings performed almost entirely with the point; and possess great spirit. His views of abbeys, churches, ruins, &c., with his shells, muffs, and every species of still life, are admirable; his landscapes frequently have great merit; and his distant views of towns and cities are not only executed in a very accurate, but a very pleasing manner.

HOLLOW TOWER, in fortification, is a rounding made of the remainder of two brisures, to join the curtain to the orillon, where the small shot are played, that they may not be so much exposed to the view of the enemy.

HOLLY, n. s. Saxon, poleyn; Dutch, huls; Lat. iler. A plant. The leaves are set about Von. XI.

the edges with long, sharp, stiff prickles: the berries are small, round, and generally of a red color, containing four triangular striated seeds in each. Of this tree there are several species; some variegated in the leaves, some with yellow berries, and some with white.—Miller.

Fairest blossoms drop with every blast;

But the brown beauty will like hollies last. Gay. Some to the holly hedge

Nestling repair, and to the thicket some ;

Some to the rude protection of the thorn. Thomson.

HOLLY, in botany. See ILEX. HOLLY, KNEE. See RUSCUS.

HOLLY, SEA. See ERYNGIUM.

HOL/LYHOCK, n. s. Sax. polpeck commonly called holyoak. Rosemallow. It is in every respect larger than the common mallow.

Holyoaks far exceed poppies for their durableness, and are very ornamental. Mortimer.

HOLLYHOCK. See ALCEA.

HOL'LYROSE, n. s. } Plants.—Ainsworth.

HOLMAN (Joseph George), a dramatic writer and performer, was born in London, and educated at Queen's College, Oxford, with a view to the church; but, having a passion for the stage, he soon quitted the university; and made his debut, in 1784, at Covent Garden theatre. At the end of the season he repaired to Dublin, and to Edinburgh; but remained with the Covent Garden company until 1800. Upon a difference with the manager, he repaired to America, where he became manager of the theatre in Charlestown. His death took place in 1817, together with that of his second wife, two days after their marriage, by the yellow fever. His productions are, Abroad and at Home, a comic opera; Red Cross Knights, a play; Votary of Wealth, a comedy; What a Blunder, a comic opera; Love gives the Alarm, a comedy; and The Gazette Extraordinary, a comedy.

HOLME, n.s. Holme or howme, whether jointly or singly, comes from the Saxon polme, a river island; or if the place be not such, the same word signifies also a hill, or mountain. The ilex; the evergreen oak.

Under what tree did'st thou take them companying together? who answered, under a holm tree.

Sus. 58.

The carver holme, the maple seldom inward sound. Spenser.

HOLME, in botany. ' See ILEX.

HOLME SOUND, a beautiful frith, on the coast of Orkney, leading to the German Ocean by Stromness. It has a circular island in the middle, called Lambholme, three miles in circunference, on which there is a farm, and which forms with the main land a pretty safe place of anchorage for ships of 200 tous burden. It has a small pier, along side of which vessels of fifty tons may lie securely.

HOLMES, FLAT and SHARP, two small islands in the British Channel, three leagues from the coast of Caerdiff. The former has about sixty acres of land, well cultivated, and a light-house, where several pilots are to be found. The latter is between Somerset and Wales; and is a per-

Y

pendicular rock, about 400 feet high, inaccessible except by two small passages. The soil is sandy and barren.

HOLMITE, a new mineral, which occurs crystallised in the form of an oblique four-sided prism, and having a specific gravity of 3.597. Its constituents are 27 lime, 21 carbonic acid, $6\frac{1}{2}$ alumina, $6\frac{1}{2}$ silica, 29 oxide of iron, and 10 water.

HO'LOCAUST, n.s. Gr. $o\lambda og$ and $\kappa a \omega \omega$. A burnt sacrifice; a sacrifice of which the whole was consumed by fire, and nothing retained by the offerer.

Isaac carried the wood for the sacrifice, which being an *holocaust*, or burnt-offering, to be consumed unto ashes, we cannot well conceive a burthen for a boy. Browne,

Let the eye behold no evil thing, and it is made a sacrifice; let the tongue speak no filthy word, and it becomes an oblation; let the hand do no unlawful action, and you render it a holocaust. Ray.

Eumenes cut a piece from every part of the victin, and by this he made it an holocaust, or an entire sacrifice. Broome.

HOLOCAUSTS, from olog, whole, and raw, I consume with fire, are often mentioned by the heathens as well as Jews ; particularly by Xenophon, who speaks of sacrificing holocausts of oxen to Jupiter, and of horses to the sun: and they appear to have been in use long before the institution of the other Jewish sacrifices by the law of Moses: see Job i. 5, xlii. 8, and Gen. viii. 20, xxii. 13. On this account the Jews, who would not allow the Gentiles to offer on their altar any other sacrifices peculiarly enjoined by the law of Moses, admitted them by the Jewish priests to offer holocausts ; because these were a sort of sacrifices prior to the law, and common to all nations. Holocausts were deemed by the Jews the most excellent of all their sacrifices. It is said that this kind of sacrifice was in common use among the heathens, till Prometheus introduced the custom of burning only a part, and reserving the remainder for his own use. See SACRIFICE.

HOLOFERNES, a lieutenant-general of the armies of Nabuchodonosor, king of Assyria, who, having in a remarkable encounter overcome Arphaxad king of the Medes, sent to all the neighbouring nations requesting them to submit to his empire, and pretending that there was no power capable of resisting him. At the same time, he passed the Euphrates, at the head of a powerful army, entered Cilicia and Syria, and subdued almost all those provinces. Being resolved to conquer Egypt, he advanced towards Judea, little expecting any resistance from the But he was soon informed that they Jews. were preparing to oppose him; and he accordingly began to besiege Bethulia. Having cut off the water which supplied it, and set guards at the only fountain which the besieged had near the walls, the inhabitants were soon reduced to extremity, and resolved to surrender, if God did not send succours in five days. A female named Judith, being informed of their resolution, now resolved, it is said, to kill Holofernes in his tent. She accordingly repaired to his tent richly attired, and pretended that God had

inspired her with the design of surrendering herself to him; when, in raptures with her beauty, he invited her to a great feast, and sunk upon his couch intoxicated. Judith, who in the night was left alone in his tent, cut off his head with his sword ; and, departing with her servant, returned with it to Bethulia. At day-break the besieged made a sally upon their enemies, who, going into the general's tent, discovered his headless carcase. They now fled with precipitation, leaving their camp, and its rich spoil, to the Jews; who pursued them, killed a great number, and returned loaded with booty. There is a great diversity of opinions concerning the time when this war between Holofernes and the Jews happened. Some date it in the captivity of Manasseh, and the pontificate of Eliakim the high-priest; others place it at some time after the Babylonish captivity; and many doubt the truth of the whole transaction.

HO'LOGRAPH, n. s. Gr. $\partial \lambda o_{\zeta} \gamma \rho \alpha \phi \omega$. This word is used in the Scottish law to denote a deed written altogether by the granter's own hand.

HOLOGRAPH, or HOLOGRAPHUM, of $\partial \lambda og$, all, and $\gamma \rho \alpha \phi \omega$, I write, in the civil law, is chiefly used of a testament written wholly in the testator's own hand. The Romans did not approve of holographic testaments; and, though Valentinian authorised them, they are not used where the civil law is in full force.

HOLOSTEUM, in botany, a genus of the trigynia order, triandria class of plants; natural order twenty-second, caryophyllei: CAL. pentaphyllous; the petals five: CAPS. unilocular, and nearly cylindrical, opening at top. Species five, of which one only, H. umbellatum, found flowering on old walls in the spring, is a native of Britain.

HOLOTHURIA, in zoology, a genus belonging to the order of vermes mollusca. The body detached, naked, gibbous, terminated by the anus: many tentacula at the other extremity, surrounding the mouth. There are twenty-three species, all inhabitants of the ocean.

1. II. pentactes, the five-rowed holothuria, has the mouth encompassed with tentacula, the body bearing tentacula five different ways. The animal is of a red color, nearly oval, or somewhat cylindrical, assuming various shapes. The mouth is set round with ten rays bristly at the points; the body longitudinally dotted in five places with clay-colored holfow warts, situated two together. It inhabits the sea of Norway, taking in and casting out again the water as it swims.

2. II. physalis, the bladder-shaped holothuria. The body of this species is oval, approaching to triangular, of a glossy transparency; the back sharpedged, of a dark green color, whence run ont a number of sinews: anteriorly the body is of a reddish hue. The trunk spiral, reddish towards they thicker and. Many tentacula of unequal length under that thicker end; the shorter ones are taper and thicker, the middle ones capillary, the point clay-color, and in shape like a ball; the rest are longer and filiform, of which the middlemost is thicker, and twice as long. Brown, in his Jamaica, calls it a diaphanous bladder with numerous tentacula representing a man's 323

belly; above, it is furnished with a comb full of cells: under the other extremity hang a number of branchy tentacula.

3. II. tremula, the quivering holothuria, commonly measures eight inches in length when dead; but alive it extends itself more than a foot, or contracts its body into a ball. Its figure is cylindric, the diameter of which is every way equal to an inch and a few lines. The hack, of a dark brown, bears a variety of fleshy pyramidlike nipples, of a dark color likewise at their basis, but white at their apex. Out of them all exudes a whitish mucilage, serving to lubricate the body. The belly is of a pale brown, and set all over with cylindric tentacula, in such numbers that the head of a pin could scarcely find room between. Their diameter is not much above a line, and their length is that of four lines. They are of a shining whiteness, except the extremity, which is of a dark color, and shaped like a socket. By the help of these tentacula the holothuria fixes its body at the bottom of the sea, so as not to be easily forced away by tempests, which would otherwise happen the more frequently, as this zoophyte dwells near the shores where the water scarcely rises to a fathom's height.

HOLP, The old preterite a HOLPEN. of HELP, which see. The old preterite and participle

His great love, sharp as his spur, hath holp him To's home before us. Shakspeare.

In a long trunk the sound is holpen, though both the mouth and the ear be a handful from the trunk ; and somewhat more holpen when the hearer is near, than when the speaker. Bacon.

HOLROYD (John Baker), lord Sheffield, a modern political writer and statesman, was a native of Yorkshire, and descended from an ancient family. When young he served under the marquis of Granby, in Germany, and afterwards travelled. On his return to England in 1776 he retired to the country, but during the American war raised at his own expense a regiment of dragoons, of which he had the command; and was commonly called colonel Holroyd. He was created lord Sheffield, of Dunamore in Ireland, while he sat in the house of commons as member for Bristol. He was next promoted to an Irish earldom; and in 1802 to an English barony. His death happened May 30th, 1821, at the age of eighty. Lord Sheffield wrote Observations on the Commerce of the American States, which went through several editions; besides tracts on the Slave Trade, and on Irish affairs. He is most known, however, as the friend of Gibbon, and the editor of his posthumous works.

HOLSTEIN, an extensive duchy of Denmark, at the northern extremity of Germany, bounded by the German Ocean and the Elbe west and south, the Baltic on the east, and Sleswick on the north; on the coast it has the gulf of Kiel, the bay of Colberg, and the gulf of Lubeck. Its superficial extent is about 3250 square miles.

The castern part is hilly, and abounds in woods and lakes; but Holstein has no mountains of importance. In the neighbourhood of Kiel, the capital, and Lubeck, the ground is well cultivated and f : le; but the central part of the

duchy is barren and heathy: the western part, on the shores of the Elbe and the German Ocean, is a flat low alluvial tract, secured with dikes against the sea. The soil of the higher parts is often light and sandy. The principal rivers of Holstein are the Elbe, the Eyder, and the Stor; the only lake of consequence is the Ploen. The canal of Kiel (See DENMARK) joins the Baltic to the Eyder and the German Ocean. The productions of Holstein are very similar to those of England, viz. wheat, barley, and oats; potatoes, hemp, flax, hops, and fruit; but its wealth is in its pasturage, sheep, and cattle. It possesses also vast numbers of horses, and the breeds are in general good. The mineral products are lime and salt, manufactured at Oldenlohe : the chief quarries of lime are in the neighbourhood of Segeberg. The only important sea-port is Altona. Gluckstadt, a smaller sea-port, is situated lower down the Elbe. Altona has a population of 23,000; Rendsburgh, 7600; Kiel (the capital), 7100; and Gluckstadt, 5200: the whole duchy about 360,000 souls. Lutheranism is the prevailing religion.

The exports of Holstein are cattle, horses, cheese, butter, and corn: 6000 horses are supposed to be sent abroad annually. The manufactures, with the exception of those of Altona, are not extensive.

This duchy is divided into Holstein Proper. the lordship of Pinneberg, and the county of Ranzau; the last two being small districts in the south-west, adjacent to Altona. Older divisions, now obsolete, were Stormarig, Ditmarsch, Wa-gria, and Holstein Proper. The whole is subdivided into bailiwics.

Charlemagne declared Holstein the northern frontier of Germany along the Eyder: it was then constituted an earldom, subsequently a duchy, and in 1523 became united with Denmark, on the reigning duke obtaining that crown : since then its history is identified with that of DEN MARK, which see. In 1806, on the formation of the confederation of the Rhine, the whole of the duchy, along with Pinneberg, Ranzau, and Altona, were declared to form no longer a part of the empire; and the king of Denmark lost his seat in the diet. In 1815, on the establishment of the Germanic confederation, he was re-admitted by the congress of Vienna, and was allowed, for this duchy and Lauenburg, three votes in the general assembly, and a place, the tenth in rank, at the ordinary diet. The interior constitution of bolstein has since received material improvement; and the Danish laws are universally introduced.

HOLSTEIN (Luke), or Holstenius (Lucas), a learned German, born at Hamburg in 1596. He was bred a Lutheran; but, being converted to popery by F. Sirmond the Jesuit, he went to Rome, and attached himself to cardinal Francis Barberini, who took him under his protection. Pope Urban VIII. gave him a canonry of St. Peter's; Innocent X. made him librarian of the Vatican; and Alexander VHL sent him, in 1655, to queen Christina of Sweden, whose formal profession of the Catholic faith he received at Inspruck. He spent his life in study, and was very learned both in sacred and profane autiquity. Though both in sacred and profane autiquity.

he was not the author of any great works, his notes and dissertations on the works of others have been highly esteemed for the judgment and precision with which they are drawn up.

HOL/STER, n. s. Sax. beolgrep; Dan. hylster, from to hold, a hiding-place. A case for a horseman's pistol.

In's rusly holsters put what meat

Into his hose he could not get. Hudibras.

HOLT, whether at the beginning or ending of the name of any place, signifies that it is or hath been woody, from the Saxon polx, a wood; or sometimes possibly from the Saxon pol, i.e. hollow, especially when the name ends in tun or dun.

HOLT (Sir John), eldest son of Sir Thomas Holt, serjeant at law, was born in 1642. He entered himself of Gray's Inn in 1658; and soon became a very eminent barrister. In the reign of James 11. he was made recorder of London, which office he discharged with much applause for about a year and a half; but lost his place for refusing to support the king's arbitrary measures. On the arrival of the prince of Orange, he was chosen a member of the convention parliament, which afforded him a good opportunity of displaying his abilities: so that, as soon as the government was settled, he was made lord chief justice of the court of king's bench, and a privy counsellor. He continued chief justice twentytwo years, with great repute for steadiness, integrity, and thorough knowledge in his profession. Upon great occasions he asserted the law with intrepidity, though he thereby incurred by turns the indignation of both houses of parliament. He published some Reports, and died in 1709. He had a British abhorrence of the interference of the military in popular tumults. When applied to sanction, by the presence of one of his people, the proceedings of the military sent to quell a riot excited by the infamous practice of crimping, the chief justice asked the officer what he intended to do if the populace refused to disperse. He replied, 'we have orders to fire upon them:' 'Have you so?' said the judge; ' then observe, if one man is killed, I will take care that you and every soldier of your party shall be hanged. Sir, acquaint those who sent you, that no officer of mine shall attend soldiers, and let them know, likewise, that the laws of this land are not to be executed by the sword. These things belong to the civil power, and you have nothing to do with them.'

Horr, a market town of the county of Norfolk, pleasantly situate on a hill eighteen miles north from East Dereham, and 119 from London. It is a neatly built town, with a good sessions-house, which is also used for an assemblyroom. The poor-house is a handsome building; and there is an excellent free-school, founded by Sir John Gresham, in the market-place, which has annexed to it a scholarship and fellowship in Sydney College, Cambridge. The patronage and government of this school is in the London Fishmongers' Company. Market on Saturday.

Fishmongers' Company. Market on Saturday. HOLWELL (John Zephaniah), F.R.S., a gentleman memorable on account of his literary merits, as well as from his being the last survivor of the twenty-three who escaped the dreadful ca-

324

tastrophe in the Black Hole at Calcutta, in 1756. He was born in 1700, and at an early period of life was sent to Bengal as a writer in the East India Company's service. In 1756 he was second in council at Fort William, when an offence was given to the nabob of Bengal by the governor's protecting a fugitive native. In revenge for this, the nabob marched against the fort with a powerful army. Drake, the governor, who had given the offence, deserted his station, and the command devolved on Mr Holwell, who, with the few men he had, bravely defended the place to the last extremity. The melancholy consequences are related in our articles CALCUTTA and Mr. Holwell's excellent constitution INDIA. overcame all his hardships, and soon after his release he returned to England. In 1758 he published a well written and affecting narrative of the sufferings of himself and his companions. He wrote also several tracts on Indian affairs, particularly a work in three parts, entitled Events relative to Bengal and Hindostan. The Manner of Inoculating for the Small Pox in the East Indies. A new Experiment for the Prevention of Crimes; published in 1786. He also published a tract, entitled Dissertations on the Origin, Nature, and Pursuits of Intelligent Beings, and on Divine Providence, Religion, and Religious Worship. Mr. Holwell died at his seat at Pinner, in Middlesex, on the 5th of November, 1798, in the ninety-eighth year of his age.

HOLY GHOST. See THEOLOGY.

HOLY GUOST, ORDER OF THE, one of the principal military orders in France, instituted by

Henry III. in 1569. It consisted formerly of 100 knights, who were to make proof of their nobility for three descents. The king was the grand master or sovereign; and, as such, took an oath on his coronation day to maintain the dignity of the order. The knights wore a golden cross(see diagram), hung

about their nocks by a blue silk riband or collar. But before they received the order of the Holy Ghost, that of St. Michael was conferred as a necessary degree; and for this reason their arms were surrounded with a double collar.

HOLYHEAD, a sea-port and market-town, cape, and parish of Wales, on the Isle of Anglesea, in the Irish Channel, whence packet-boats for Dublin usually sail every day. It has a market on Saturday. The parish is a peninsula about six miles long, and two or three broad, bounded nearly the sea. The church stands above the harbour, within an old quadrangular fortification, with a bastion at each corner, built about 450. On a mountain near it is another old fortification called Turris Munimentum, which is a stone wall without mortar; and in its centre is a small turret, that contains a well. Holyhead was formerly visited by Irish rovers, and was defended as a place of consequence. There are several druidical remains in its neighbourhood. The church was built in the reign of Edward III. and is in the form of a cross,

with a very antique porch and steeple. The old chapel near it is now converted into a schoolhouse. A salt-house was erected on an island in the harbour in queen Anne's reign, but it is now in ruins. It is said that one of the Welsh princes founded a college here about the year 580; but some suppose that it was not founded till the beginning of the twelfth century. The head of this college was called Pendas, and was one of the three spiritual lords of Anglesea. At the dissolution of the monasteries it became the property of the Gwynnes, till in 1648, it was settled by Thomas Gwynne, esq. on Jesus' College, Oxford, for the maintenance of two fellows and as many scholars. It has good inns, but no fresh water, except from the clouds, nor any bread but what comes from Ireland. A bath and assembly-room were erected in 1770. Under the mountains that overhang the town is a large cavern in the rock, supported by natural pillars, called the Parliament House, accessible only by boats, and the tide runs into it. The rocks abound with sea-ware, of which they make kelp. In the neighbourhood there is a large vein of white fullers' earth, and another of yellow. It lies nine miles south of the isle of Skerries, sixty east of Dublin, and 290 north-west of London.

HOLY ISLAND, a small island on the coast of England, ten miles south-east of Berwick, in Northumberland. Bede calls it a semi-island, as being twice an island and twice continent in one day; for, at the flowing of the tide, it is encompassed by water : and, at the ebb, there is almost dry passage both for horses and carriages to and from the main land; from which, if measured on a straight line, it is about two miles east; but, on account of some quicksands, passengers are obliged to make so many detours that the length of the way is nearly doubled. The water over these flats at spring tides is only seven feet deep. This island was by the Britons called Inis Medicante, and Lindisfarn; and, from its becoming the habitation of some of the first monks in this country, it afterwards obtained its present name of Holy Island. It measures from east to west about two miles and a quarter, and from north to south nearly one mile and a half. At the north-west part runs out a spit of land of about a mile in length. The monastery is situated at the south extremity; and a little north of it stands the village, chiefly inhabited by fishermen. There is plenty of fish and fowls; but the air and soil are bad. The north and east coasts are formed of perpendicular rocks; the other sides sink by gradual slopes to the sands. There is a commodious harbour, defended by a block-house; which last was surprised and taken in 1715, but was soon retaken. Holy Island, though really part of Northumberland, belongs to Durham; and all civil disputes must be determined by the justices of that county. It was a very ancient episcopal seat, and had eighteen bishops till the removal of the see to Chester. The north and south walls of the church are standing; part of the west end remains, but the east is down. The columns of the nave are of four different kinds, twelve feet high and five feet diameter, massy and richer than those of Durham; the bases and capitals

plain, supporting circular arches. Over each arch are large windows in pairs, separated by a short column: and over these are smaller single windows. In the north and south walls are some pointed arches. The length of the body is 138 feet, breadth eighteen feet, and with the two aisles thirty-six feet. Somewhat to the east is the base of a cross, and to the west the present parish church.

⁺ HOLY-ROOD DAY, a festival observed by the Roman Catholics, in memory of the exaltation of our Saviour's cross.

HOLY-ROOD HOUSE. See EDINBURGH.

HOLYWELL, a town of North Wales, in Flintshire, chiefly celebrated for a spring, called St. Winifred's Well, from whence it takes its name. This well lies at the bottom of three high hills, and is covered by a small Gothie building, which is said to have been erected by the countess of Richmond, mother of Henry VII. The Gothic work on the outside of this building, which forms a canopy to the wall, is very hand-The accommodations for bathing are some. very good; the water is very clear, and never freezes, boils up like a caldron, and discharges upwards of twenty-six tons of water in a minute. It now turns several mills erected for working copper, making brass wire, paper, and snuff, and winding cotton, &c. At the back of the town is a hill, in which lead ore is found. It is fifty-two miles N. N. W. of Shrewsbury, and 212 north-west of London.

HOLZMINDEN, a town of Germany, in the states of Brunswick, principality of Wolfenbuttel, at the confluence of the Weser and the Holz, containing 3300 inhabitants. It has large iron works, and a brisk trade in wood. Three miles north-east of Corvey, and twenty west of Grubenhagen.

HOM'AGE, n. s. & v. a. Fr. hommage; low Hom'AGER, n. s. Lat. homagium; Fr. hommager, from homo, a man, homage being the service of every man. Service paid and fealty professed to a sovereign, or a superior lord; obeisance; respect paid by external action. Bishops do homage before the king on appointment to their sees.

For, sothly, he ne shuld have, than, in all his lif corage to sinne—but give his herte and body to the service of Jesu Crist, and thereof do him *homage*.

Chaucer. The Persones Tale.

Call my sovereign yours,

And do him homage as obedient subjects.

Shakspearc. Thou blushest, Antony; and that blood of thine Is Cæsar's homager. Id.

His subjects, traylors, are received by the duke of Bretagne, his homager. Bacon's Henry VII.

The chiefs, in a solemn manner, did their homages, and made their oaths of fidelity to the carl marshal. Davies.

His spear against her head he fiercely threw,

Which to that face performing homage due,

Kissing her helmet, thence in thousand shivers flew. Fletcher's Purple Island.

The gods great mother, when her heavenly race Do homage to her. Denham.

A tuff of daisies on a flowery lay They saw, and thitherward they went their way; To this both knights and dames their homage made, And due obeisance to the daisy paid. Dryden.

Go, go, with homage yon proud victors meet ! So, lie like dog beneath your master's feet. Id. What is station high ?

Tis a proud mendicant; it boasts and begs; It begs an alms of homage from the throng, And oft the throng denies its charity.

Young's Night Thoughts.

No eyes

But mine now drink this sight of loveliness ;

I should be sole in this sweet solitude,

And with the spirit of the place divide

The homage of these waters .- I will call her, Byron. Manfred.

To what gulphs

A single deviation from the track Of human duties, leads even those who claim The homage of mankind, as their born due, And find it, till they forfeit it themselves.

Id. Sardanapalus

HOMBERG (William), a celebrated physician, chemist, and philosopher, born in Batavia, in the East Indies, in 1652. His father was a Saxon gentleman, who afterwards settling at Amsterdam, this son prosecuted his studies there; and thence removed to Jena, and to Leipsic. In 1642 he was made advocate at Magdeburg, where he studied experimental philosophy. Some time after he travelled into Italy; and studied medicine, anatomy, and botany, at Padua. He afterwards studied at Bologna, and at Rome. He at length travelled into France, England, and Holland; obtained the degree of M.D. at Wittemberg; travelled into Germany and the North; visited the mines of Saxony, Bohemia, Hungary, and Sweden; and returned to France, where M. Colbert made him such advantageous offers as induced him to fix his resi-dence at Paris. M. Homberg, who was already well known for his discovery of phosphorus, for a pneumatic machine of his own invention, more perfect than that of Guericke, was received into the Academy of Sciences in 1691, and had the care of the laboratory. The duke of Orleans, afterwards regent, made him his chemist, presented him with a pension, and, in 1704, made him his first physician. He had abjured the Protestant religion in 1682, and died in 1715. There are many learned and curious pieces of his writing, in the memoirs of the Academy of Sciences, and in several journals.

HOMBERG IN HESSE, a walled town of Hesse-Cassel, Germany, on the Elze, with 2900 inhabitants, and manufactures of iron and glass. It consists of the old and new town; and has an ancient castle on a hill, remarkable for a well of the extraordinary depth of 480 feet. Twenty miles south of Cassel, and eleven S.S.E. of Fritzlar.

HOMBURG ON THE HEIGHT, a town of Germany, the capital of the principality of Hesse-Homburg. It is situated on the Lahn, and has manufactures of watches, caps, stockings, and hats. Nine miles north of Frankfort. Population 3000.

n 3000. HOME', n. s. & adj. Goth. hann, ; Sax. heim ; Dan. hiem ; Sax. Soot. hanne. Ilis HOME'LINESS, n. s. ham; Scot. hame. Ilis HOME'LY, adj. & adv.) own house; a private

dwelling; his own country; place of constant residence : when united with a substantive it signifies of the same country. Home, to one's house or country; close to one's own bosom or affairs; to the utmost, fully, entirely. Homely, plain, coarse, rude ; plain, not elegant ; not beautiful: applied both to persons and things. The word home conveys a meaning to an Englishman which no foreign language can supply, and is rather to be felt than expressed : it is applied to persons and things.

Alla the king cometh home, sone after this, Unto his castel, of the which I you told ; And asketh wher his wif and child is.

Chaucer. The Man of Lawes Tale.

God grante thee thin homly fo to espie For in this world n'is werse pestilence, Than homly fo all day in thy presence. Id. The Marchantes Tale.

Not only this Griseldes thurgh hire wit Coude all the fete of wifly homlinesse.

Id. The Clerkes Tate.

For right as men sayn that overgret homlinesse engendereth dispreising; so fareth it, by to gret humi-Id. The Tale of Melibeus. litee or mekeness.

Within this wood, out of a rock did rise A spring of water, mildly tumbling down;

Whereto approached not in any wise The homely shepherd, nor the rader clown.

Spenser.

I'm now from home, and out of that provision Which shall be needful for your entertainment. Shakspeare.

Id.

Accuse him home and home. Home-keeping youth have ever homely wits. Id.

Our stomachs will make what's homely savoury. Id.

Like rich hangings in an homely house,

So was his will in his old feeble body. Id.

Be plain, good son, and homely in thy drift : Riddling confession finds but riddling shrift. Id.

How can tyrants safely govern home,

Unless abroad they purchase great alliance ? Id. Their determination is to return to their homes, and to trouble you no more. Id.

With his prepared sword he charges home

My unprovided body. Id. King Lear. A loyal sir

To him thou followest : I will pay thy graces Home both in word and deed. Id. Tempest.

Men of age object too much, adventure too little, and seldom drive business home to the full period; but content themselves with a mediocrity of success. Bacon.

Let the exportation of home commodities be more in value than the importation of foreign. Id.

That cometh up home to the business, and taketh off the objection clearly. Sanderson.

Homely persons, the more they endeavour to adorn themselves, the more they expose the defects they want to hide. Clarendon.

It is for homely features to keep home;

Milton. They had their name thence. But when such amity at home is showed,

What then are their confederacies abroad.

Marvell.

Each place haudsome without curiosity, and homely Sidney. without loathsomeness.

Crafty enough either to hide his faults, or never to shew them, but when they might pay home. Id.

I am sorry to give him such home thrusts; for he lays himself so open, and uses so little art to avoid them, that I must either do nothing, or expose his Stilling fleet. weakness.

Something like home that is not home is to be desired; it is found in the house of a friend. Temple.

Home is the sacred refuge of our life,

Secured from all approaches but a wife.

Dryden.

When Hector went to see

His virtuous wife, the fair Andromache, He found her not at *home*; for she was gone. Id. Those who have *homes*, when *home* they do repair, a last hedging call their wandering friends. Id.

To a last lodging call their wandering friends. Id. Thus, like the god his father, homely drest,

He strides into the hall a horrid guest. Id. Their homely fare dispatched, the hungry band Invade their trenchers next. Id.

Poison may be false;

The home thrust of a friendly sword is sure. Id. With honour to his home let Theseus ride, With love to friend. Id.

At home the hateful names of parties cease, And factious souls are wearied into peace. Id.

He that encourages treason lays the foundation of a doctrine that will come home to himself.

L'Estrange.

One of Adam's children in the mountains lights on a glittering substance; *home* he carries it to Adam, who finds it to be hard, to have a bright yellow colour, and exceeding great weight. *Locke*.

It is observed by some, that there is none so homely but loves a looking-glass. South.

This is a consideration that comes home to our interest. Addison.

Homer has opened a great field of raillery to men of more delicacy than greatness of genus, by the homeliness of some of his sentiments. Id.

Break through the thick array Of his thronged legions, and charge home upon him. Id.

Flandria, by plenty made the home of war,

Shall weep her crime, and bow to Charles restored. Prior.

They who pass through a foreign country, towards their native *home*, do not usually give up themselves to the pleasures of the place. *Atterbury*.

I can only refer the reader to the authors themselves, who speak very *home* to the point. Id.

These considerations, proposed in general terms, you will, by particular application, bring home to your own concern. Wake.

Now Strephon daily entertains

His Chloe in the homeliest strains. Swift. He makes choice of some piece of morality; and, in order to press this home, he makes less use of reasoning. Broome.

She comes too meanly drest to win our smile; And calls herself Content, a *homely* name !

Young's Night Thoughts.

His warm but simple *home*, where he enjoys With her who shares his pleasures and his heart Sweet converse. May the grass wither from thy feet ! the woods

Deny thee shelter ! earth a home ! the dust A grave ! the sun his light ! and heaven her God !

Byron.

Where rose the mountains, these to him were friends;

Where rolled the ocean thereon was his home, Where a blue sky, and glowing clime extends,

He had the passion and the power to roam.

Id. Childe Harold.

HOME (Henry), lord Kames, an eminent Scottish lawyer, and author, descended from an ancient family, was born in 1696, in Berwickshire. In early youth he was lively, and eager in the acquisition of knowledge. After studying

the civil and the municipal law of his country, at Edinburgh, he attended for some time the chamber of a writer to the signet. The strength. and vivacity of his natural abilities, combined with unwearied application, soon raised him to be an ornament to the Scottish bar; and, on the 2d of February, 1752, he was advanced to the bench as one of the judges of the court of session, under the title of lord Kames. Before this period, however, notwithstanding the unavoidable labors of his profession, he had become the author of several works. In 1728 he published Remarkable Decisions of the Court of Session from 1716 to 1728 in 1 vol. folio.-In 1732 appeared Essays upon several subjects in Law, viz. Jus tertii ; Beneficium Cedendarum Actionum; Vinco Vincentem; and Prescription; in 1 vol. 8vo. This was succeeded, in 1741, by Decisions of the Court of Session from its first institution to the year 1740, abridged and digested under proper heads, in form of a Dictionary, in 2 vols. folio : a very laborious work, and of the greatest utility to the practical lawyer. In 1747 appeared Essays upon several subjects concerning British Antiquities, viz. 1. Introduction of the feudal law into Scotland. 2. Constitution of parliament. 3. Honor, dignity. 4. Succession, or descent; with appendix upon hereditary and indefeasible right, composed in 1745, and published in 1747, in 1 vol. 8vo. It may be proper, though not in strict chronological order, to continue the list of his writings on law, before we mention his works on other subjects. In 1757 he published The Statute Law of Scotland abridged, with Historical Notes, in 1 vol. 8vo. In 1759 he produced a new work, entitled Historical Law Tracts, in 1 vol. 8vo. In 1760 he published in 1 vol. folio The Principles of Equity; a work which shows both the fertility of the author's genius and his indefatigable application. In 1766 he gave to the public another volume, in folio, of Remarkable Decisions of the Court of Session, from 1730 to 1752. In 1777, appeared his Elucidations respecting the Common and Statute Law of Scotland, in 1 vol. 8vo. In 1780 a volume in folio, of Select Decisions of the Court of Session, from 1752 to 1768.

Lord Kames was much inclined to metaphysical disquisitions. In 1751 he published Essays on the Principles of Morality and Natural Religion, a small volume, which gave rise to much controversy. It contained, in the most explicit terms, the doctrine which then made so much noise, under the appellation of philosophical necessity. In 1761 he published an Introduction to the Art of Thinking, in 1 vol. 12mo. His Elements of Criticism appeared in 1762, in 3 vols. 8vo. A farther cvidence of the various pursuits of his active mind was given in 1772, when he published a work in one volume 8vo, entitled The Gentleman Farmer, being an attempt to improve Agriculture by subjecting it to the test of Rational Principles. This book met with a very favorable reception in Scotland, where, as a practical farmer, its author gave many proofs of his skill. After he succeeded, in right of his lady, to the ample estate of Blair Drummond in Perthshire, he formed, and in part successfully ex"ecuted, a plan for turning a large moss, consisting of at least 1500 acres into arable land. In 1773 lord Kames published Sketches of the History of Man, in 2 vols. 4to. Ilis last work, entitled Loose Hints upon Education, chiefly concerning the Culture of the Heart, was published in 1781, in 1 vol. 8vo, when its venerable author was in his eighty-fifth year. Lord Kames published many temporary and fugitive pieces. He for a a great length of time had the principal management of all the societies and boards for promoting the trade, fisheries, and manufactures, in Scotland. He took likewise a chief lead in the distribution and application of the funds arising from the estates in Scotland, which had unfortunately been annexed to the crown. Nor was he less zealous in supporting, both with his writings and personal influence, various literary associations. Lord Kames died on the 27th day of December, 1782. As he had no disease but the debility necessarily resulting from extreme old age, a few days before his death he went to the court of session, addressed all the judges separately, told them he was speedily to depart, and took a solemn and an affectionate farewel. A life of lord Kames, with a view of his writings, was published by lord Woodhouselee.

HOME (John), an eminent dramatic poet, born in the vicinity of Ancrum, in Roxburghshire, in 1724. It being the desire of his parents that he should enter the church, he attended the philosophical and theological classes of the univer-sity of Edinburgh for several years. But his studies were for a while suspended by the pub-lic commotions of the year 1745. Mr. Horne was one of about twenty students of the university who offered their services as volunteers, to act against the common enemy. But intimidated by the number of their opponents, or adverse to the hardships of a military life, the college company soon disbanded. Mr. Home, however, retained his arms, and marched with a detachment of the royal army to Falkirk ; where, in the battle fought in its neighbourhood, in which the rebels vanquished the king's troops, he was taken prisoner, and confined for some time in the castle of Doun. From this place of captivity he effected his escape; and, the battle of Culloden having blasted all the hopes of the pretender's adherents, tranquillity and order were soon restored. Mr. Home resumed his studies, and was licensed to preach in 1747. Not long after he visited England; for it appears that he was introduced to Collins the poet, at Winchester, by a Mr. Barrow, who had been his fellow-student at the university. Collins addressed to him his Ode on the Superstition of the Highlanders, considered as the subject of poetry, composed in 1749, but not published till many years after his death. In 1750 he was settled minister of Athelstaneford, in East Lothian; but having been accustomed to the bustle of a city, and the society of men of letters, Mr. Home found himself rather disagreeably situated, in an obscure village, where he had no opportunity of distinguishing himself. It was about this period that, in his retirement, he began seriously to court the dramatic muse. The first tragedy he wrote was Agis, founded on a portion of the Lacedæmonian

and Garrick said afterwards that no circumstance, in the course of his management, gave him so much concern as the rejection of this play. But the ardor of Home was not to be thus suppressed. Being acquainted with the leading characters in Scotland, a ready reception of his play at Edinburgh was secured, and at the first representation of it in the theatre in Canongate, on the 14th of December, 1756. Mr. Home and several of his clerical brethren were present. The hue and cry was immediately raised; that a clergyman should write a play, and that ministers of the gospel should witness its performance, were crimes unheard of in the annals of the church. The author was summoned to appear before the bar of the presbytery; his friends were peremptorily dragged before the same tribunal, some of them dismissed with censure, and others suspended from their office. While such was the state of affairs in Scotland, Douglas having been performed to crowded houses during the greater part of the season, and fully gratifying the most sanguine hopes of the author, it was, through the interest of David Hume, brought forward on the London stage. Here it soon became a standard tragedy, and maintains its ground to the present day. The clamors of his enemies having not yet subsided in Scotland, Mr. Home preached his farewell sermon to his congregation on the 5th of June, 1757; and, to prevent further proceedings in the church courts against him, gave in the resignation of his charge to the presbytery of Haddington two days after. With his living, Mr. Home appears for a while to have abandoned his native land, for he now repaired to London, where he produced several other tragedies, under the patronage of Garrick. They are all, however, greatly inferior to his Douglas. Agis, the first of his dramatic pieces, was finely acted, and assisted by spectacle; otherwise, it is probable that it would not have been performed a second night. His third tragedy was founded on the cruel treatment which the two Setons, sons of the governor of Berwick, had experienced from the English. At Garrick's suggestion, the title was altered, from the siege of Berwick to the siege of Aquileia, and it was acted in 1759. Some of the passages are very fine, but upon the whole it is a tame performance. Mr. Home's last production, Alfred, lived only three nights. In the year 1760 Mr. Home published a volume of plays, containing Agis, Douglas, and the Siege of Aquileia, which he dedicated to his present majesty, then prince of Wales. Three other tragedies appeared some time after. The whole were collected and edited in two volumes at Edinburgh, in 1798, under the inspection of the late Mr. Woods. Mr. Home, at the advanced age of seventy-eight, published his long-meditated work, entitled The History of the Rebellion in Scotland, in 1745-6, in which he recorded the exploits and remarks of his youth, but the public were disappointed in it. For a

considerable time prior to his death, Mr. Home's

history. This being rejected by the London

theatres, he next composed his celebrated Doug-

las. In presenting this to the London manager,

he had the mortification of a second refusal;

mind as well as body, seemed to be much impaired, and in this distressful state he lingered for many years. He died at Merchiston House, on the 4th of September, 1808, in the eighty-fifth year of his age

HOME'BORN, adj. Home and born. Native ; natural.

Though to be thus elemented, arm

These creatures from homeborn intrinsick harm. Donne.

Domestic; not foreign.

Numerous bands With homeborn lyes, or tales from foreign lands.

Pope. HOME'BRED, adj. Home and bred. Native; natural.

God hath taken care to anticipate every man, to draw him early into his church, before other competitors, homebred lusts, or vicious customs of the world, should be able to preteud to him. Hammond.

No homebred jars her quiet state controul,

Nor watchful jealousy torments her soul. Gay. Not polished by travel; plain; rude; artless; uncultivated.

Only to me two homebred youths belong. Dryden.

Domestic; not foreign.

But if of danger, which hereby doth dwell,

And homehred evil, ye desire to hear,

I can you tydings tell. Spenser. Faerie Queene. This once happy land,

By homebred fury rent, long groaned.

Phillips.

HOME'FELT, adj. Home and felt. Inward; private.

Yet they in pleasing slumber lulled the sense, And in sweet madness robbed it of itself; But such a sacred and homefelt delight, Such sober certainty of waking bliss, Milton. I never heard till now.

Happy next him who to these shades retires, Whom nature charms, and whom the muse inspires, Whom humbler joys of homefelt quiet please, Successive study, exercise, and ease. Pope.

HOME'LYN, n. s. A kind of fish. HOME'MADE, adj. Home and made. Made at home; not manufactured in foreign parts.

A tax laid on your native product, and homemade commodities, makes them yield less to the first seller. Locke.

HOMER, n. s. A Hebrew measure of about three pints.

HOMER, the prince of the Greek poets, flourished, according to Dr. Blair, about 900 B. C.; according to Dr. Priestley, 850; according to the Arundelian marbles, 300 after the taking of Troy; and, agreeably to them all, above 400 years before Plato and Aristotle. Seven cities disputed the glory of having given him birth, which are enumerated in the following distich :--

Smyrna, Rhodes, Colophon, Salamis, Chios, Argos, Athenæ;

Orbis de patria certat, Homere tua.

Or, as a modern poet has complained :--

Seven mighty towns contend for Homer dead,

Through which the living Homer begged his bread.

We have no authentic particulars of his life. The most regular account is that which goes

under the name of Herodotus, and is usually printed with his history: and though it is supposed to be spurious, yet, as it is ancient, was made use of by Strabo, and exhibits the idea which the later Greeks, and the Romans in the age of Augustus, entertained of Homer, we must content ourselves with it. Menalippus, a native of Magnesia, is said to have settled at Cumæ, where he married the daughter of a citizen called Homyres, and had by her a daughter, Critheis. The father and mother dying, the young woman was left under the tuition of Cleonax, her father's friend, by whom she was seduced, and who, on her proving with child, sent her to Smyrna, which was then building, to conceal the misfortune. This was eighteen years after the founding of Cumæ, and about 168 after the destruction of Troy. Critheis was here delivered of Homer, whom she called Melesigenes, because he was born on the banks of that river. Her good conduct afterwards induced Phemius, a schoolmaster, to marry her, and adopt her son After the death of Phemius and Critheis, Homer succeeded to his father-in-law's school; until a shipmaster named Mentes, who was a man of learning, persuaded him to travel with him. This brought him to Egypt; whence he brought into Greece the names of their gods, the chief ceremonies of their worship, and a more improved knowledge of the arts. He also visited other parts of Africa and Spain ; in his return whence he touched at Ithaca, where he was first troubled with a disease of his eyes. Being recommended to Mentor, one of the chief men of Ithaca, he was here informed of many things relating to Ulysses, which he afterwards inserted in his Odyssey; and, after much time spent in visiting the coasts of Peloponnesus and the islands, arrived at Colophon, where he lost his sight. He now returned to Smyrna, and finished his Iliad. Some time after, the low state of his finances obliged him to go to Cuma, where his poems were highly applauded; but when he proposed to immortalise their town, if they would allow him a salary, he was answered, that there would be no end of maintaining all the 'O $\mu\eta\rho\sigma\iota$, or blind men : hence he is said to have obtained the name of Homer. He afterwards wandered through several places to Chios, where he married, and composed his Odyssey. Some time after, having produced various verses in praise of the cities of Greece, especially of Athens and Argos, he went to Samos, where he spent the winter reciting them. In the spring he proceeded to Io, one of the Sporades, intending to continue his voyage to Athens. Landing, however, at Chios by the way, he fell sick and died, and was buried on the sea shore. The principal works ascribed to Homer are the Hiad and Odyssey. The Batrachomyomachia, or battle of the frogs and mice, is rejected by almost all modern critics, as a parody incompatible with the simplicity of the Homeric age. Of his Hymns some are acknowledged by Lucian and Pausanias; others are undoubtedly spurious. Of the Iliad and Odyssey, the editions are very numerous. The Odyssey, the editions are very numerous. best are those of Barnes, Clarke, and Heyne. The two leading English translations are those of Pope and Cowper, in rhyme and blank verse.

It has, however, been much controverted whether the Iliad and Odyssey were originally epic poems of the kind they now appear to be; and particularly, whether they were the production of any one individual, or only a happy assemblage of detached rhapsodies. This question has been ably discussed by Heyne and Wolf, the modern critics upon Homer; and the arguments of these great scholars, cannot be dismissed as rash conjectures. We shall avail ourselves, therefore, of Mr. Talfourd's able abstract of them in Mr. Rutt's Appendix to Dr. Priestley's Lectures on Oratory and Criticism.

'The first object, in a case of this kind,' observes this ingenious gentleman, 'should be to ascertain those facts in which all parties agree. The light which external history affords us is rather feeble and dubious. It must be admitted, that there is no fact well authenticated respecting the existence of the poems in a connected form, until we are told that they were brought into Greece by Lycurgus. Plutarch, in his Life of that legislator, informs us that, in his journey in Asia, 'he probably had sight of Homer's poems, which were first preserved by the posterity of Creophylus; and, having observed that the delightful fictions thrown over them did not prevent the author from abounding in maxims of state policy and rules of moral action, transcribed them, and carried with him into Greece that entire collection which we have now among us. For at that time there was only an obscure rumor in Greece of the fame of these poems, and only a few scattered fragments in circulation, until Lycurgus published them entire.' Hence Cleomenes called Homer the poet of the Spartans. Besides Plutarch, Dio Chrysostom, Heraclides Pontus, and Elian, bear testimony to the fact of the poems having, in some state or other, been introduced into Greece by Lycurgus. Heyne, indeed, contends that nothing more is to be gathered from these authorities, than that the poems were preserved among the Chians by means of the recitations of the rhapsodists; and that the knowledge of their merit was brought to Sparta hy her lawgiver, on his return from his travels. Whatever was done by Lycurgus fell very short of exhibiting the poems in that state in which even the Greeks afterwards possessed them. For a number of writers agree in declaring that the honor of this noble work belongs to Pisistratus, or to some of his family. Solon now made a law for the recital of the poems; and is even said to have directed that this office should be performed, not by repeating them in fragments, without regard to the progress of the story, but in some order of regular succession.

'It must be allowed that the expression of Cicero, that Pisistratus 'prinus Homeri libros confusos antea, disposuisse dicitur,' will not prove much, even respecting the opinion of the orator, as to their original condition. For it does not follow, because the books of Homer were confused or disarranged in the time of their first editor, that they were not composed in a regular series. Indeed the expression, 'works of Homer then in confusion,' seems to imply that Pisistratus did not divide the poems into books for the first time, or first apply to them that denomination. The other external evidence on either side is but trivial. The works must be for the most part, their own witnesses.

The chief arguments by which the hypothesis adopted by Wolf and Heyne is supported are, 1. It is exceedingly improbable that, in any age to which Homer's personal existence can be referred, one man should have been capable of composing works of the extent, consistency, and poetical elevation of the Iliad and Odyssey. 2.1t seems impossible that poems of so great a length as the Iliad and the Odyssey should have been composed and preserved entire, without being committed to writing; and it is certain that there is not the least trace, even in tradition, of any complete written or engraved copy of the works of Homer till the exertions of his Athenian editor, or at least till those of Lycurgus. 3. The profession of the rhapsodists, as is evident from many Greek writers, flourished from the earliest periods. Their name, compounded from $\rho a \pi$ - $\tau \omega \omega \eta v$, to join together or compose verses, signified their occupation and character. They answered, in many respects, to the Celtic bards. They chaunted, sung, or recited poems, chiefly, at least in the earliest times, of their own composition, at the tables of princes, and in public assemblies, as well as in the houses of the great. They were held in high esteem and even veneration, more especially in the earliest periods; and they were the sole depositaries of the religion, the moral precepts, and the old and favorite legends of the people among whom they lived. -- It is further alleged that there are parts of the Iliad and Odyssey, even as they now exist, which are either entirely spurious, or very much corrupted from the original. Of the former of these descriptions seems to be the passage in the eighteenth book of the Iliad, from v. 356 to v. 368, in which, from the mourning of the Greeks over the body of Patroclus, we are suddenly presented with a taunting speech of Jupiter to Juno, and her angry reply, neither of which bears the least relation to the immediate subject; and, at the close, we as suddenly re-turn to Thetis, in her ascent to the palace of Vulcan. In the fourth book of the Odyssey a passage occurs, at the 620th line, where a con-versation with Menelaus is abruptly broken off, and four lines follow of which all explanation seems hopeless. Eustathius has recourse to the violent measure of changing the whole scene from the palace of Menelaus at Sparta to that of Ulysses at Ithaea. But the passage is now universally agreed to be either misplaced or spurious. Other and yet more important instances are brought forward by Heyne, in the notes to the different books of his edition of Homer.

'On the other side, the following arguments are adduced, to establish the individuality of the author of the Iliad :—1. The genius which the Iliad exhibits is no proof that it is not the production of a single mind in a barbarous age. Those who speak of poetry as a progressive art, and liken it to the improvements of social life, and things which depend for their excellence or experience, seem to know little of its essence. I has no connexion with the progressions of time it depends not on external circumstance; it follows not in the train of knowledge, nor improves as mathematical science is unfolded ; its origin is in the heart, and its objects are to be found in every part of the creation. Indeed, the age of Homer was far more favorable to its perfection than later times. The truth is, that no one ever supposes Homer to have written with a standard of epic poetry before him, like that which Aristotle has drawn from his works. He composed from the impulses of an harmonious mind; and his compositions were, therefore, harmonious. There is nothing wonderful, or even paradoxical, in this. Genius is the soul of art. The unities admired by the critics must originally take their rise from the heart, from the natural perception of loveliness, from the innate admiration of order, or they are worthless. Genius broods over the events it celebrates, and brings them into keeping and harmony. There is nothing really so methodical as the most daring invention, in so far as method is more than an empty form. If Homer conceived the plan of an epic in his mind, and strove to write 'up to the height of his great argument,' it was because he felt that within such a compass his mind would discover a fit and noble range. 2. The objection which arises from the ignorance of letters, or the want of the materials for writing, is certainly of a more forinidable kind. But it is to be remembered, that the very uncertainty attending the introduction of letters into Greece proves that they must have been of high antiquity, and certainly before the first Olympiad, when a regular computation of time began. The testimony of Josephus, who speaks merely in a sceptical tone, and not at all in that of decided negative, is rendered of less importance by the circumstance that he was attempting to depreciate, as far as possible, the antiquities of Greece, and to throw discredit on its early history. But, even supposing the works of Homer not to have been originally transcribed, the very opponents of his personality have fur-nished us with the means by which they were probably transmitted. The rhapsodists, whom they suppose, and probably with justice, to have recited his poems, were no unworthy depositaries of so great a treasure, especially if we hold them in the veneration with which they would desire us to regard them. 3. Setting aside, for the sake of argument, all the technical rules of epic poetry, which have been sometimes said to have been observed in the works imputed to Homer, there is very strong internal evidence that they are, or, at least, that one of them is, the production of an individual genius. In the whole texture one pervading mind is clearly to be seen. roets even of the same age, and when treating of nearly the same subject, can scarcely be supposed to have attained so complete a uniformity of style. If two leaves of the forest are never found exactly to correspond, how shall we believe that a number of minds, and these of the first and most original class, should so exactly agree? The same epithets recur, the same kind of similes prevail, the same mode of expression is used in the last as in the first book of the Iliad .- And, lastly, that there are interpolations in the Iliad and Odyssey may be readily ad-

mitted, without affecting the authenucity of the whole. And it is to be observed, that some corruptions have been noticed as such by the most ancient critics-a circumstance which proves, that, though their attention was directed to the question, they never doubted, as they have never expressed any doubt, of the genuineness of the great mass of the poems. The evidence in favor of the common hypothesis, from the testimony of every age, is exceedingly strong. Pindar, who lived 485 years before Christ, repeatedly mentions Homer as he would any other person, and not as a collection of verses. He speaks of the Iliad as having rendered Ajax immortal, and he alludes to the perils of Ulysses as having been celebrated, adored, and rendered greater, by the delightful poetry of Homer. In the fragments collected by Brunck, Mimerinus and Simonides both allude to Homer. The latter speaks of him as the man of Chios, and quotes the beautiful comparison made by Glaucus, of human life to the fall of leaves and their springing forth again into verdure. Herodotus repeatedly refers to our bard. He quotes the Iliad and the Odyssey, and distinguishes between them. He even, which is stronger than all, denies the Cypriacs to be genuine productions of Homer, because they contradict the Iliad. Thucydides also frequently alludes to him, and always without any intimation that he is speaking of a number of songs by various authors. Aristotle flourished but a short interval from the time when the family of Pisistratus were in power, and yet nothing can be more clear than that he had no idea that they had, for the first time, collected together and arranged the poems which they edited; for he criticises at large that very arrangement; he gives it the highest praise; he makes it the basis of a system of epic poetry; and yet he never attributes this to any other than to the original author. He bestows no praise on Pisistratus, who, in this respect, deserved it all.'

HOMER (Henry), Rev., the son of a clergyman, the rector of Birdingbury, Warwickshire, was born there in 1752. He received the rudiments of his education at Rugby school, and afterwards took the degree of bachelor in divinity at Emanuel College, Cambridge, in 1783. Mr. Homer, in conjunction with Dr. Coombe and others, assisted in bringing out a variorum edition of Horace, and ably edited the works of Cæsar, Livy, Tacitus, Sallust, and the epistles of Ovid. His death took place in 1791.

HOME'SPUN, *adj.* Home and spun. Spun or wrought at home; not made by regular manufacturers.

Instead of homespun coifs were seen

Good pinners, edged with colberteen. Swift. Not made in foreign countries.

He appeared in a suit of English broad-cloth, very plain, but rich : every thing he wore was substantial, honest, homespun ware. Addison.

Plain; coarse; rude; homely; inelegant. They sometimes put on, when they go ashore, long

sleeveless coats of homespun cotton. Sandy's Tr. We say, in our homespun English proverb, fle killed

two hirds with one stone. Dryden. Our homespun authors must forsake the field,

And Shakspeare to the soft Scarlatti yield. Addison.

HOMESPUN', n. s. A coarse, inelegant, rude, untaught, rustic man. Not in use.

What hempen homespuns have we swaggering here, So near the cradle of the fairy queen ? Shakspeare.

HOME'STALL, n.s.) Sax. bam and rese. S The place of the house. HOME'STEAD, n. s.

Both house and homestead into seas are borne, And rocks are from their own foundations torn. Druden.

HOME'WARD, adj. Sax. ham and peans HOME'WARDS, adj. Towards home; to-Sax. pam and peaps. wards the native place; towards the place of residence.

For Goddes love, let us now sone at eve Our leve take, and homwarde let us tourne.

Chaucer. Troilus and Creseide.

My affairs

Do even drag me homeward.

Shakspeare.

Since such Love's natural station is, may still My love descend, and journey down the hill, Not pauting after growing beauties; so I shall ebb on with them who homeward go.

Donne. Look homeward, angel now, and melt with ruth;

And, O ye dolphins, waft the hapless youth !

Milton.

Then Urania homeward did arise, Leaving in pain their well-fed hungry eyes.

Sidney.

And wandering homewards, seek our safety hence. Dryden.

Like a long team of snowy swans on high, Which clap their wings, and cleave the liquid sky, Which, homeward from their watery pastures borne, They sing, and Asia's lakes their notes return. Id.

Or when the ploughman leaves the task of day, And trudging homeward whistles on his way ; When the big-uddered cows with patience stand, Waiting the strokings of the damsel's hand. Gay. HOM'ICIDE, n. s.) Fr. homicide; Lat. HOMICI'DAL, adj. Shomicidium, from homo. Manslanghter; destruction: murder, in some cases. Homicidal, murderous; destructive; bloody.

Homieide (that is manslaughter) is in divers wise. Som maner of homicide is spirituel and som is bodily. Chaucer. The Persones Tale.

The apostles command to abstain from blood : construe this according to the law of nature, and it will seem, that homicide only is forbidden ; but construe it in reference to the law of the Jews, about which the question was, and it shall easily appear to have a clean other sense, and a truer, when we expound it of eating, and not of shedding blood. Hooker.

I'd undertake the death of all the world, So might I live one hour in your sweet bosom. - If I thought that, I tell thee, homicide,

These nails should rend that beauty from my cheeks. Shakspeare.

What wonder is't that black detraction thrives ! The homicide of names is less than lives. Dryden. Hector comes, the homicide, to wield

His conquering arms, with corps to strew the fie'd.

Id. The troop forth issuing from the dark recess, With homicidal rage, the king oppress. Pope.

HOMICIDE, in law, signifies in general the taking away of any person's life. It is of three kinds; justifiable, excusable, and felonious. The first has no share of guilt at all; the second very little; but the third is the highest crime against the law of nature that man is capable of committing.—Blackstone.

Homicide, Excusable, is of two sorts, according to this learned commentator, per infortunium, by misadventure; or se defendendo, upon a principle of self-preservation. We will first see wherein these two species of homicide are distinct, and then wherein they agree.

1. Homicide per infortunium, or by misadventure, is where a man, doing a lawful act, without any intention of hurt, unfortunately kills another: as where a man is at work with a hatchet, and the head thereof flies off and kills a stander-by; or where a person, qualified to keep a gun, is shooting at a mark, and undesignedly kills a man; for the act is lawful, and the effect is merely accidental. So where a parent is moderately correcting his child, a master his apprentice or scholar, or an officer punishing a criminal, and happens to occasion his death, it is only misadventure, for the act of correction was lawful: but if he exceeds the bounds of moderation, either in the manner, the instrument, or the quantity of punishment, and death ensues, it is manslaughter at least, and in some case (according to the circumstances) murder; for the act of immoderate correction is unlawful. Thus, by an edict of the emperor Constantine, when the rigor of the Roman law with regard to slaves began to relax and soften, a master was allowed to chastise his slave with rods and imprisonment, and if death accidentally ensued he was guilty of no crime : but if he struck him with a club or a stone, and thereby occasioned his death, or if in any other yet grosser manner 'immoderate suo jure utatur, tunc reus homicidii fit.' But to proceed. A tilt or tournament, the martial diversion of our ancestors, was however an unlawful act; and so are boxing and sword-playing, the succeeding amusements of their posterity: and, therefore, if a knight in the former case, or a gladiator in the latter, be killed, such killing is felony of manslaughter. But, if the king command or permit such diversion, it is said to be only misadventure; for then the act is lawful; in like manner as, by the laws both of Athens and Rome, he who killed another in the pancratium, or public games, authorised or permitted by the state, was not held to be guilty of homicide. Likewise to whip another's horse, whereby he runs over a child and kills him, is held to be accidental in the rider, for he has done nothing unlawful; but manslaughter in the person who whipped him, for the act was a tresspass, and at best a piece of idleness, of inevitably dangerous consequence. And in general, if death ensues in consequence of an idle, dangerous, and unlawful sport, as shooting or casting stones in a town, or the barbarous diversion of cockthrowing; in these and similar cases the slayer is guilty of manslaughter, and not misadventure only; for these are unlawful acts.

2. Homicide se defendendo, or in self-defence, upon a sudden affray, is also excusable, rather than justifiable, by the English law. This species of self-defence must be distinguished from that just now mentioned, as being calculated to hinder the perpetration of a capital crime; which is not only a matter of excuse, but of justification. But

the self-defence which we are now speaking of, is that whereby a man may protect himself from an assault, or the like, in the course of a sudden brawl or quarrel, by killing him who assaults him. And this is what the law expresses by the word chance-medley, or (as some rather choose to write it) chaud-medley; the former of which in its etymology signifies a casual affray, the latter an affray in the heat of blood or passion; both of them of pretty much the same import; but the former is in common speech too often erroneously applied to any manner of homicide by misadventure; whereas it appears by stat. 24 Henry VIII. c. 5, and our ancient books, that it is properly applied to such killing as happens in self-defence upon a sudden rencounter. The right of natural defence does not imply a right of attacking : for, instead of attacking one another for injuries past or impending, men need only have recourse to the proper tribunals of justice. Wherefore, to excuse homicide by the plea of self-defence, it must appear that the slayer had no other possible means of escaping from his assailant. In some cases this species of homicide (upon chance-medley in self-defence) differs but little from manslaughter, which also happens frequently upon chance-medley in the proper legal sense of the word. But the true criterion between them seems to be this: when both parties are actually combating at the time when the mortal stroke is given, the slayer is then guilty of manslaughter; but if the slayer hath not begun to fight, or (having begun) endeavours to decline any further struggle, and afterwards, being closely pressed by his antagonist, kills him to avoid his own destruction, this is homicide excusable by self-defence. For which reason the law requires, that the person who kills another in his own-defence, should have retreated as far as he conveniently or safely can, to avoid the violence of the assault, before he turns upon his assailant; and that not fictitiously, or in order to watch his opportunity, but from a real tenderness of shedding blood. And though it may be cowardice in time of war, between two independent nations, to flee from an enemy; yet, between two fellow subjects, the law countenances no such point of honor: because the king and his courts are the vindices injuriarum, and will give to the party wronged all the satisfaction he deserves. In this the civil law also agrees, or perhaps goes rather farther; qui cum aliter tueri se non possunt, damni culpam dederint, innoxii sunt. The party assaulted must therefore flee as far as he conveniently can, either by reason of some wall, ditch, or other impediment, or as far as the fierceness of the assault will permit him; for it may be so fierce as not to allow him to yield a step, with manifest danger of his life, or enormous bodily harm; and then in his defence he may kill his assailant instantly. And, as the manner of the defence, so is also the time to be considered : for if the person assaulted does not fall upon the aggressor till the affiay is over, or when he is running away, this is revenge and not defence. Neither under the color of self-defence, will the law permit a man to screen himself from the guilt of deliberate murder; for if two persons, A and B, agree to

fight a duel; and A gives the first onset, and B retreats as far as he safely can, and then kills A, this is murder, because of the previous malice and concerted design. But if A upon a sudden quarrel assaults B first, and, upon B's returning the assault, A really and bona fide flies; and, being driven to the wall, turns again upon B and kills him, this may be se defendendo, according to some; though others have thought this opinion too favorable : inasmuch as the necessity, to which he is at last reduced, originally arose from his own fault. Under this excuse of self-defence the principal civil and natural relations are comprehended : therefore, master and servant, parent and child, husband and wife, killing an assailant in the necessary defence of each other respectively, are excused; the act of the relation assisting being construed the same as the act of the party himself. There is one species of homicide se defendendo where the party slain is equally innocent as he who occasions his death : and yet this homicide is also excusable from the great universal principle of self-preservation, which prompts every man to save his own life preferably to that of another, where one of them must inevitably perish. As, among others, in that case mentioned by lord Bacon, where two persons being shipwrecked, and getting on the same plank, but finding it not able to save them both, one of them thrusts the other from it, whereby he is drowned. He who thus preserves his own life, at the expense of another man's, is excusable through unavoidable necessity, and the principle of self-defence; since their both remaining on the same weak plank is a mutual, though innocent, attempt upon, and endangering of, each other's life. Let us next take a view of the circumstances wherein these two species of homicide, by misadventure and self-defence, agree; and those are in their blame and punishment. For the law sets so high a value upon the life of a man, that it always intends some misbehaviour in the person who takes it away, unless by the command or express permission of the law. In the case of misadventure it presumes negligence, or at least a want of sufficient caution in him who was so unfortunate as to commit it, who therefore is not And, as to the necessity altogether faultless. which excuses a man who kills another se defendendo, lord Baeon entitles it necessitas culpabilis, and thereby distinguishes it from the for-mer necessity of killing a thief or a malefactor. For the law intends that the quarrel or assault arose from some unknown wrong, or some provocation, either in word or deed: and since in quarrels both parties may be and usually are in some fault, and it scarcely can be tried who was originally in the wrong, the law will not hold the survivor entirely guiltless. But it is clear, in the other case, that, where I kill a thief who breaks into my house, the original default can never be upon my side. The law besides may have a farther view, to make the crime of homicide more odious, and to caution men how they ven-

ture to kill another upon their own private judgment; by ordaining, that he who slays his neighbour, without an express warrant from the law so to do, shall in no case be absolutely free from guilt. Nor is the law of England singular in

this respect. Even the slaughter of enemies required a solemn purgation among the Jews; which implies, that the death of a man, however it happens, will leave some stain behind it. And the Mosaical law appointed certain cities of refuge for him 'who killed his neighbour unawares; as if a man goeth into the wood with his neighbour to hew wood, and his hand fetcheth a stroke with the axe to cut down a tree, and the head slippeth from the helve, and lighteth upon his neighbour that he die, he shall flee into one of those cities and live.' But it seems he was not held wholly blameless, any more than in the English law; since the avenger of blood might slay him before he reached his asylum, or if he afterwards stirred out of it till the death of the high priest. In the imperial law likewise casual homicide was excused, by the indulgence of the emperor signed with his own sign-manual, annotatione principis; otherwise, the death of a man, however committed, was in some degree punishable. Among the Greeks homicide by misfortune was explated by voluntary banishment for a year. In Saxony a fine is paid to the kindred of the slain; which also, among the western Goths, was little inferior to that of voluntary homicide: and in France, under the old government, no person was absolved in cases of this nature, without a largess to the poor, and the charge of certain masses for the soul of the party killed. The penalty inflicted by the English law is said by Sir Edward Coke to have been anciently no less than death ; which, however, is with reason denied by later and more accurate writers. It seems rather to have consisted in a forfeiture, some say of all the goods and chattels, others of only a part of them, by way of fine or weregild : which was probably disposed of, as in France, in pios usus, according to the humane superstition of the times, for the benefit of his soul who was thus suddenly sent to his account with all his imperfections on his head. But that reason having long ceased, and the penalty, especially if a total forfeiture, growing more severe than was intended, in proportion as personal property has become more considerable, the delinquent has now, and has had as early as the English records will reach, a pardon and writ of restitution of his goods as a matter of course and right, only paying for suing out the same. And, indeed, to prevent this expense, in cases where the death has notoriously happened by misadventure or in self-defence, the judges usually permit, if not a direct, a general verdict of acquittal.

Homicibe, Felonious, is an act of a very different nature from the former, being the killing of a human creature, of any age or sex, without justification or excuse. This may be done either by killing one's self, or another man : for the consideration of which see the articles MAN-SLAUGHTER, MURDER, and SUICIDE.

HOMICIDE, JUSTIFIABLE, is of different kinds. 1. Such as is owing to some unavoidable necessity, without any will, intention, or desire, and without any inadvertence or negligence, in the party killing, and therefore without any shadow of blame; as, for instance, by virtue of
